Act, 1882, codifies for the United Kingdom the law relating to bills of exchange, promissory notes, and cheques. One peculiar Scottish rule is preserved, but in other respects uniform rules are laid down for England, Scotland, and Ireland. After glancing briefly at the history of these instruments, it will probably be convenient to discuss the subject in the order followed by the Act, namely, first, to treat of a bill of exchange, which is the original and typical negotiable instrument, and then to refer to the special provisions which apply to promissory notes and cheques. Two salient characteristics distinguish negotiable instruments from other engagements to pay money. In the first place, the assignee of a negotiable instrument, to whom it is transferred by indorsement or delivery according to its tenor, can sue thereon in his own name; and, secondly, he holds it by an independent title. If he takes it in good faith and for value, he takes it free from "all equities," that is to say, all defects of title or grounds of defence which may have attached to it in the hands of any previous party. These characteristic privileges were conferred by the Law Merchant, which is part of the Common Law, and are now confirmed by statute.

From a legal point of view the history of bills of exchange is short, though somewhat obscure. It is ably summed up by Lord Chief Justice Cockburn in his judgment in *Goodwin v. Roberts*, L.R. 10 Ex. pp. 346-358. Bills of exchange were probably invented by Florentine Jews. They were well known in England in the Middle Ages, though there is no reported decision on a bill of exchange before the year 1603. At first their use seems to have been confined to foreign bills between English and foreign merchants. It was afterwards extended to domestic bills between traders, and finally to bills of all persons, whether traders or not. But for some time after they had come into general employment, bills were always alleged in legal proceedings to be drawn *secundum usum et consuetudinem mercatorum*. The foundations of our modern law were laid by Lord Mansfield with the aid of juries of London merchants. No better tribunal of commerce could have been devised. Subsequent judicial decisions have developed and systematized the principles thus laid down. Promissory notes are of more modern origin than bills of exchange, and their validity as negotiable instruments was doubtful until it was confirmed by 3 and 4 Anne, c. 8. Cheques are the creation of the modern system of banking. The codifying Act of 1882 amends the law in a few minor details, and fills up a few gaps which were uncovered by authority, but in the main it is an exact reproduction of the then existing law. The change effected is a change of form, not of substance. Before the Act, the law was to be found in 17 statutes dealing with isolated points, and about 2600 cases scattered over some 300 volumes of reports.

Definition.—By § 3 of the Act a bill of exchange is defined to be "an unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a sum certain in money to or to the order of a specified person, or to bearer."¹ The person who gives the order is called the drawer. The person thereby required to pay is called the drawee. If he assents to the order, he is then called the acceptor. An acceptance must be in writing and must be signed by the drawee. The mere signature of the drawee is sufficient (§ 17). The person to whom the money is payable is called the payee. The

¹ This is also the definition given in the United States, by § 126 of the general Act relating to negotiable instruments, prepared by the Conference of State Commissioners on uniform legislation, and it has been adopted in the leading States.

person to whom a bill is transferred by indorsement is called the indorsee. The generic term "holder" includes any person in possession of a bill who holds it either as payee, indorsee, or bearer. A bill which in its origin is payable to order becomes payable to bearer if it is indorsed in blank. If the payee is a fictitious person the bill may be treated as payable to bearer (§ 7).

The following is a specimen of an ordinary form of a bill of exchange:—

£100

LONDON, 1st January 1901.

Three months after date pay to the order of Mr J. Jones the sum of one hundred pounds for value received.

BROWN AND Co.

To Messrs. Smith and Sons, Liverpool.

The scope of the definition given above may be realized by comparing it with the definition given by Comyn's *Digest* in the early part of the 18th century:—"A bill of exchange is when a man takes money in one country or city upon exchange, and draws a bill whereby he directs another person in another country or city to pay so much to A, or order, for value received of B, and subscribes it." Comyn's definition illustrates the original theory of a bill of exchange. A bill in its origin was a device to avoid the transmission of cash from place to place to settle trade debts. Now a bill of exchange is a substitute for money. It is immaterial whether it is payable in the place where it is drawn or not. It is immaterial whether it is stated to be given for value received or not, for the law itself raises a presumption that it was given for value. But though bills are a substitute for cash payment, and though they constitute the commercial currency of the country, they must not be confounded with money. No man is bound to take a bill in payment of debt unless he has agreed to do so. If he does take a bill, the instrument ordinarily operates as conditional, and not as absolute payment. If the bill is dishonoured the debt revives. Under the laws of some Continental countries, a creditor, as such, is entitled to draw on his debtor for the amount of his debt, but in England the obligation to accept or pay a bill rests solely on actual agreement. A bill of exchange must be an unconditional order to pay. If an instrument is made payable on a contingency, or out of a particular fund, so that its payment is dependent on the continued existence of that fund, it is invalid as a bill, though it may, of course, avail as an agreement or equitable assignment. In Scotland it has long been the law that a bill may operate as an assignment of funds in the hands of the drawee, and § 53 of the Act preserves this rule.

Stamp.—Bills of exchange must be stamped, but the Act of 1882 does not regulate the stamp. It merely saves the operation of the stamp laws, which necessarily vary from time to time according to the fluctuating needs and policy of the Exchequer. Under the Stamp Act, 1891, bills payable on demand are subject to a fixed stamp duty of one penny, and by the Finance Act, 1899, a similar privilege is extended to bills expressed to be payable not more than three days after sight or date. The stamp may be impressed or adhesive. All other bills are liable to an *ad valorem* duty. Inland bills must be drawn on stamped paper, but foreign bills, of course, can be stamped with adhesive stamps. As a matter of policy, English law does not concern itself with foreign revenue laws. For English purposes, therefore, it is immaterial whether a bill drawn abroad is stamped in accordance with the law of its place of origin or not. On arrival in England it has to conform to the English stamp laws.

Maturity.—A bill of exchange is payable on demand when it is expressed to be payable on demand, or at sight, or on presentation, or when notice for payment is expressed. In calculating the maturity of bills payable at

a future time, three days, called days of grace, must be added to the nominal due date of the bill. For instance, if a bill payable one month after sight is accepted on the 1st January, it is really payable on 4th February, and not on 1st February as its tenor indicates. On the Continent generally days of grace have been abolished as anomalous and misleading. Their abolition has been proposed in England, but it has been opposed on the ground that it would curtail the credit of small traders who are accustomed to bills drawn at certain fixed periods of currency. When the last day of grace is a non-business day some complicated rules come into play (§ 14). Speaking generally, when the last day of grace falls on Sunday or a common law holiday the bill is payable on the preceding day, but when it falls on a bank holiday the bill is payable on the succeeding day. Complications arise when Sunday is preceded by a bank holiday; and, to add to the confusion, Christmas Day is a bank holiday in Scotland, but a common law holiday in England. When the code was in committee an attempt was made to remove these anomalies, but it was successfully resisted by the bankers on alleged grounds of practical convenience.

Acceptance.—By the acceptance of a bill the drawee becomes the principal debtor on the instrument and the party primarily liable to pay it. The acceptor of a bill "by accepting it engages that he will pay it according to the tenor of his acceptance," and is precluded from denying the drawer's right to draw or the genuineness of his signature (§ 54). The acceptance may be either general or qualified. As a qualified acceptance is so far a disregard of the drawer's order, the holder is not obliged to take it; and if he chooses to take it he must give notice to antecedent parties, acting at his own risk if they dissent (§§ 19 and 44). The drawer and indorsers of a bill are in the nature of sureties. They engage that the bill shall be duly accepted and paid according to its tenor, and that if it is dishonoured by non-acceptance or non-payment, as the case may be, they will compensate the holder provided that the requisite proceedings on dishonour are duly taken. Any indorser who is compelled to pay the bill has the like remedy as the holder against any antecedent party (§ 55). A person who is not the holder of a bill, but who backs it with his signature, thereby incurs the liability of an indorser to a holder in due course (§ 56). An indorser may by express term either restrict or charge his ordinary liability as stated above. *Prima facie* every signature to a bill is presumed to have been given for valuable consideration. But sometimes this is not the case. For friendship, or other reasons, a man may be willing to lend his name and credit to another in a bill transaction. Hence arise what are called *accommodation bills*. Ordinarily the acceptor gives his acceptance to accommodate the drawer. But occasionally both drawer and acceptor sign to accommodate the payee, or even a person who is not a party to the bill at all. The criterion of an accommodation bill is the fact that the principal debtor according to the instrument has lent his name and is in substance a surety for some one else. The holder for value of an accommodation bill may enforce it exactly as if it was an ordinary bill, for that is the presumable intention of the parties. But if the bill is dishonoured the law takes cognizance of the true relations of the parties, and many of the rules relating to principal and surety come into play. Suppose a bill is accepted for the accommodation of the drawer. It is the drawer's duty to provide the acceptor with funds to meet the bill at maturity. If he fails to do so, he cannot rely on the defence that the bill was not duly presented for payment or that he did not receive due notice of dishonour. If the holder, with notice of the real state of the facts, agrees to give time

to the drawer to pay, he may thereby discharge the acceptor.

Holder in due Course.—The holder of a bill has special rights and special duties. He is the mercantile owner of the bill, but in order to establish his ownership he must show a mercantile title. The bill must be negotiated to him, that is to say, it must be transferred to him according to the forms prescribed by mercantile law. If the bill is payable to order, he must not only get possession of the bill, but he must also obtain the indorsement of the previous holder. If the bill is payable to bearer it is transferable by mere delivery. A bill is payable to bearer which is expressed to be so payable, or on which the only or last indorsement is an indorsement in blank. If a man lawfully obtains possession of a bill payable to order without the necessary indorsement, he may obtain some common law rights in respect of it, but he is not the mercantile owner, and he is not technically the holder or bearer. But to get the full advantages of mercantile ownership the holder must be a "holder in due course,"—that is to say, he must satisfy three business conditions. First, he must have given value, or claim through some holder who has given value. Secondly, when he takes the bill, it must be regular on the face of it. In particular, the bill must not be overdue or known to be dishonoured. An overdue bill, or a bill which has been dishonoured, is still negotiable, but in a restricted sense. The transferee cannot acquire a better title than the party from whom he took it had (§ 36). Thirdly, he must take the bill honestly and without notice of any defect in the title of the transferor,—as, for instance, that the bill or acceptance had been obtained by fraud, or threats, or for an illegal consideration. If he satisfies these conditions he obtains an indefeasible title, and can enforce the bill against all parties thereto. The Act substitutes the expression "holder in due course" for the somewhat cumbersome older expression "bonâ-fide holder for value without notice." The statutory term has the advantage of being positive instead of negative. The French equivalent "*tiers porteur de bonne foi*" is expressive. Forgery, of course, stands on a different footing from a mere defect of title. A forged signature, as a general rule, is a nullity. A person who claims through a forged signature has no title himself, and cannot give a title to anyone else (§ 24). Two exceptions to this general rule require to be noted. First, a banker who in the ordinary course of business pays a demand draft held under a forged indorsement is protected (§ 60). Secondly, if a bill be issued with material blanks in it, any person in possession of it has *primâ facie* authority to fill them up, and if the instrument when complete gets into the hands of a holder in due course the presumption becomes absolute. As between the immediate parties the transaction may amount to forgery, but the holder in due course is protected (§ 20).

Dishonour.—The holder of a bill has special duties which he must fulfil in order to preserve his rights against the drawers and indorsers. They are not absolute duties; they are duties to use reasonable diligence. When a bill is payable after sight, presentment for acceptance is necessary in order to fix the maturity of the bill. Accordingly the bill must be presented for acceptance within a reasonable time. When a bill is payable on demand it must be presented for payment within a reasonable time. When it is payable at a future time it must be presented on the day that it is due. If the bill is dishonoured the holder must notify promptly the fact of dishonour to any drawer and indorser he wishes to charge. If, for example, the holder only gives notice of dishonour to the last indorser, he could not sue the drawer unless the last indorser or

some other party liable has duly sent notice to the drawer. When a foreign bill is dishonoured the holder must cause it to be protested by a notary public. The bill must be noted for protest on the day of its dishonour. If this be duly done, the protest, *i.e.*, the formal notarial certificate attesting the dishonour can be drawn up at any time as of the date of the noting. A dishonoured inland bill may be noted, and the holder can recover the expenses of noting, but no legal consequences attach thereto. In practice, however, noting is usually accepted as showing that a bill has been duly presented and has been dishonoured. Sometimes the drawer or indorser has reason to expect that the bill may be dishonoured by the drawee. In that case he may insert the name of a "referee in case of need." But whether he does so or not, when a bill has been duly noted for protest, any person may, with the consent of the holder, intervene for the honour of any party liable on the bill. If the bill has been dishonoured by non-acceptance it may be "accepted for honour *supra protest*." If it has been dishonoured by non-payment it may be paid *supra protest*. When a bill is thus paid and the proper formalities are complied with, the person who pays becomes invested with the rights and duties of the holder so far as regards the party for whose honour he has paid the bill, and all parties antecedent to him (§§ 65 to 68).

Discharge.—Normally a bill is discharged by payment in due course, that is to say, by payment by the drawee or acceptor to the holder at or after maturity. But it may also be discharged in other ways, as for example by coincidence of right and liability (§ 61), voluntary renunciation (§ 62), cancellation (§ 63), or material alteration (§ 64).

Conflict of Laws.—A bill of exchange is the most cosmopolitan of all contracts. It may be drawn in one country, payable in another, and indorsed on its journey to its destination in two or three more. The laws of all these countries may differ. Provision for this conflict of laws is made by § 72, which lays down rules for determining by what law the rights and duties of the various parties are to be measured and regulated. Speaking broadly, these rules follow the maxim *Locus regit actum*. A man must be expected to know and follow the law of the place where he conducts his business, but no man can be expected to know the laws of every country through which a bill may travel. For safety of transmission from country to country bills are often made out in sets. The set usually consists of three counterparts, each part being numbered and containing a reference to the other parts. The whole set then constitutes one bill, and the drawee must be careful only to accept one part, otherwise if different accepted parts get into the hands of different holders, he may be liable to pay the bill twice (§ 71). Foreign bills circulating through different countries have given rise to many intricate questions of law. But the subject is perhaps one of diminishing importance, as in many trades the system of "cable transfers" is superseding the use of bills of exchange.

A cheque "is a bill of exchange drawn on a banker payable on demand" (§ 73). For the most part the rules of law applicable to bills payable on demand apply in their entirety to cheques. But there are certain peculiar rules relating to the latter which arise from the fact that the relationship of banker and customer subsists between the drawer and drawee of a cheque. For example, when a person has an account at a bank he is, as an inference of law, entitled to draw on it by means of cheques. A right to overdraw can, of course, only arise from agreement. The drawer of a cheque is not absolutely discharged by the holder's omission to present it for payment within a reasonable time. He is only discharged to the extent of any actual damage he may have suffered

through the delay (§ 74). Apart from any question of delay, a banker's authority to pay his customer's cheques is determined by countermand of payment or by notice of the customer's death (§ 75). Of recent years the use of cheques has enormously increased, and they have now become the normal machinery by which all but the smallest debts are discharged. To guard against fraud, and to facilitate the safe transmission of cheques by post, a system of crossing has been devised which makes crossed cheques payable only through certain channels. The first Act which gave legislative recognition to the practice of crossing was the 19 and 20 Vict. c. 95. That Act was amended in 1858, and a consolidating and amending Act was passed in 1876. The Act of 1876 is now repealed, and its provisions are re-enacted with slight modifications by §§ 76 to 82 of the Bills of Exchange Act, 1883. A cheque may be crossed either "generally" or "specially." A cheque is crossed generally by drawing across it two parallel lines and writing between them the words "& Co." When a cheque is crossed generally it cannot be paid over the counter. It must be presented for payment by a banker. A cheque is crossed specially by adding the name of the banker, and then it can only be presented through that particular banker. A cheque, whether crossed generally or specially, may further be crossed with the words "not negotiable." A cheque crossed "not negotiable" is still transferable, but its negotiable quality is restricted. It is put on pretty much the same footing as an overdue bill. The person who takes it does not get, and cannot give a better title to it, than that which the person from whom he took it had. These provisions are supplemented by provisions for the protection of paying and collecting bankers who act in good faith and without negligence. Suppose that a cheque payable to bearer, which is crossed generally and with the words "not negotiable," is stolen. The thief then gets a tradesman to cash it for him, and the tradesman gets the cheque paid on presentment through his banker. The banker who pays and the banker who receives the money for the tradesman are protected, but the tradesman would be liable to refund the money to the true owner. Again, assuming payment of the cheque to have been stopped, the tradesman could not maintain an action against the drawer. (See also under BANKING.)

A promissory note is defined by section 83 of the Act to be an "unconditional promise in writing made by one person to another, signed by the maker, engaging to pay on demand, or at a fixed or determinable future time, a sum certain in money to or to the order of a specified person or to bearer." A promissory note may be made by two or more makers, and they may be liable either jointly, or jointly and severally, according to its tenor (§ 85). For the most part, rules of law applicable to a bill of exchange apply also to a promissory note, but they require adaptation. A note differs from a bill in this: it is a direct promise to pay, and not an order to pay. When it issues it bears on it the engagement of the principal debtor who is primarily liable thereon. The formula for applying to notes the rules as to bills is that "the maker of a note shall be deemed to correspond with the acceptor of a bill, and the first indorser of a note shall be deemed to correspond with the drawer of a bill payable to drawer's order" (§ 89). Rules relating to presentment for acceptance, acceptance, acceptance *supra* protest, and bills in a set, have no application to a note. Moreover, when a foreign note is dishonoured it is not necessary, for English purposes, to protest it. All promissory notes are, under the Stamp Act, 1891, subject to an *ad valorem* stamp duty. Inland notes must be on impressed stamp paper. Foreign notes are stamped with adhesive stamps. For ordinary legal purposes a bank note may be

regarded as a promissory note made by a banker payable to bearer on demand. It is, however, subject to special stamp regulations. It is not discharged by payment, but may be re-issued again and again. In the interests of the currency the issue of bank notes is subject to various statutory restrictions. A bank, other than the Bank of England, may not issue notes in England unless it had a lawful note issue in 1844. On the other hand, Bank of England notes are legal tender except by the bank itself.

In fundamental principles there is general agreement between the laws of all commercial nations regarding negotiable instruments. As Mr Justice Story, the great American lawyer, says: "The law respecting negotiable instruments may be truly declared, in the language of Cicero, to be in a great measure not the law of a single country only, but of the whole commercial world. *Non erit lex alia Romæ, alia Athenis, alia nunc alia posthac, sed et apud omnes gentes et omni tempore, una eademque lex obtinebit*" (Swift v. Tyson, 16 Peters 1). But in matters of detail each nation has impressed its individuality on its own system. The English law has been summarized above. Perhaps its special characteristics may be best brought out by comparing it with the French code and noting some salient divergences. English law has been developed gradually by judicial decision founded on trade custom. French law was codified in the 17th century by the "Ordonnance de 1673." The existing "Code de Commerce" amplifies but substantially adopts the provisions of the "Ordonnance." The growth of French law was thus arrested at an early period of its development. The result is instructive. A reference to Marius' treatise on Bills of Exchange, published about 1670, or Beawes' *Lex Mercatoria*, published about 1740, shows that the law, or rather the practice, as to bills of exchange was even then fairly well defined. Comparing the practice of that time with the law as it now stands, it will be seen that it has been modified in some important respects. For the most part, where English law differs from French law, the latter is in strict accordance with the rules laid down by Beawes. The fact is that, when Beawes wrote, the law or practice of both nations on this subject was nearly uniform. But English law has gone on growing while French law has stood still. A bill of exchange in its origin was an instrument by which a trade debt due in one place was transferred in another place. This theory French law rigidly keeps in view. In England bills have developed into a paper currency of perfect flexibility. In France a bill represents a trade transaction; in England it is merely an instrument of credit. English law affords full play to the system of accommodation paper; French law endeavours to stamp it out. A comparison of some of the main points of difference between English and French law will show how the two theories work. In England it is no longer necessary to express on a bill that value has been given for it, for the law raises a presumption to that effect. In France the nature of the consideration must be stated, and a false statement of value avoids the bill in the hands of all parties with notice. In England a bill may be drawn and payable in the same place. In France the place where a bill is drawn should be so far distant from the place where it is payable that there may be a possible rate of exchange between the two. This so-called rule of *distantia loci* is said to be disregarded now in practice, but the code is unaltered. As French lawyers put it, a bill of exchange necessarily presupposes a contract of exchange. In England since 1765 a bill may be drawn payable to bearer, though formerly it was otherwise. In France it must be payable to order; if it were not so it is clear that the rule requiring the consideration to be truly stated would be a nullity. In England a bill originally

Foreign laws.

payable to order becomes payable to bearer when indorsed in blank. In France an indorsement in blank merely operates as a procuration. An indorsement, to operate as a negotiation, must be to order, and must state the consideration; in short, it must conform to the conditions of an original draft. In England, if a bill is dishonoured by non-acceptance, a right of action at once accrues to the holder. In France no cause of action arises unless the bill is again dishonoured at maturity; the holder in the meantime is only entitled to demand security from the drawer and indorsers. In England a sharp distinction is drawn between current and overdue bills. In France no such distinction is drawn. In England no protest is required in the case of the dishonour of an inland bill, notice of dishonour being sufficient. In France every dishonoured bill must be protested. Opinions may differ whether the English or the French system is better calculated to serve sound commerce and promote a healthy commercial morality. But an argument in favour of the English system may be derived from the fact that as the various Continental codes are from time to time revised and re-enacted, they tend to depart from the French model and to approximate to the English rule. The effect upon English law of its recent codification has yet to be proved. A common objection to codification in England is that it deprives the law of its elastic character. But when principles are once settled common law has very little elasticity. On the other hand no code is final. Modern parliaments legislate very freely, and it is a much simpler task to alter statute law than to alter common law. Moreover, legislation is cheaper than litigation. One consequence of the codification of the English law relating to bills is clear gain. Nearly all the colonies have adopted the Act, and where countries are so closely connected as England and her colonies, it is an obvious advantage that their mercantile transactions should be governed by one and the same law expressed in the same words.

The ordinary text-books on the law of bills of exchange are constantly re-edited and brought up to date. The following among others may be consulted:—*BYLES, Bills of Exchange*; *CHALMERS, Bills of Exchange*; *DANIEL, Law of Negotiable Instruments* (United States); *NOUGUIER, Des lettres de change et des effets de commerce* (France); *THORBURN, Bills of Exchange Act, 1882* (Scotland); *STORY, Bills of Exchange* (United States); *HODGINS, Bills of Exchange Act, 1890* (Canada). (M. D. CH.)

Bills of Lading. See **AFFREIGHTMENT**.

Bills of Sale. See **SALE**.

Bilma, or **HAWAR.** See **SAHARA**.

Biloxi, a city of Harrison county, Mississippi, U.S.A., on the coast of Mississippi Sound, in the southern part of the state, on a line of the Louisville and Nashville railway. It is a place of resort, both in summer and winter, for the people of New Orleans and Mobile, and has numerous hotels, and an excellent water-supply. Population (1880), 1540; (1900), 5467.

Bilston, a market town (under an urban district council), and railway station, of Staffordshire, England, 2½ miles S.E. of Wolverhampton (of which parliamentary borough it forms part). Recent erections are the post-office, the market hall (rebuilt), and baths and wash-houses (rebuilt). Area, 1867 acres; population (1901), 24,034.

Bimetallism.—From mediæval times until the beginning of the 19th century coins of both gold and silver were current in the leading commercial countries of Europe, ordinances being issued from time to time by the governments concerned with the object of fixing their relative value, or more correctly, their equivalency as legal tender. Both metals were, moreover, as a rule coined at the mints without restrictions as to quantity. England was the

first to abandon this system and to adopt gold as the sole standard of value; at a later date the United States followed this example; and, in 1873, the Latin Union, of which France was the leading nation, took the first steps in the same direction. From this date monometallism prevailed all over Europe, silver coins in gold-using countries becoming mere tokens. The object of bimetallists is to revert to a monetary system somewhat similar to that which prevailed in the Latin Union before 1873, though it is generally admitted that the proposed Bimetallic Union must cover a wider area. Bimetallism is, in fact, a currency system which would establish a right on the part of the debtor to discharge his liabilities at his option in either of the two metals at a ratio fixed by law. For this system to be successful it is obvious that a fixed ratio or value between the metals must be maintained. From 1820 to 1870 the ratio of the value of silver to gold (taking annual averages) appears to have varied between the limits of 15·19 to 1 and 15·95 to 1—a variation of about 5 per cent. during a period of 50 years, and a variation which bimetallists accounted for by the inefficiency of the currency ordinances. Between 1872 and 1900 the ratio varied between the limits of 15·65 to 1 and 35·03 to 1—a variation of about 124 per cent. in a period of twenty-eight years—a period during which there were no currency ordinances with regard to the relative value at which metals could be freely coined. This increase of instability is the true basis of the bimetallic controversy, a controversy which may be divided under three heads: (1) Was the change in the stability of the relative value of the metals due to the changes in the monetary systems of the world, or was it due to the increased production of silver or to other similar causes? (2) Would it be possible to establish a fixed ratio of value between the metals by the enactment of bimetallic laws? (3) Would such a change in the English monetary system, if practicable, be on the whole advantageous? With regard to the last question the aim of bimetallists is, by linking the metals together, both to create a more stable standard of value, and to limit the variations in the rate of exchange between gold and silver-using and bimetallic countries, and also, by increasing the volume of metal in the currency, to produce a rise in prices, or, at all events, to prevent a further fall.

In the article on Money (*Ency. Brit.* xvi. 731) the history of this controversy is brought up to the year 1883. Since that date there have been no great changes in the monetary systems of Europe or America, though the discussion on this problem has never ceased. The report issued by the Royal Commission of 1888 to inquire into the recent changes in the relative values of the precious metals probably constitutes the most important contribution to this debate. The evidence given before the Commission is also of great value, that of Professor Alfred Marshall, from a theoretical point of view, being specially worthy of study. On that occasion Professor Marshall advocated a monetary system under which certificates would be issued, each standing for a certain amount of gold and a certain amount of silver, the ratio between the two being fixed by international agreement—a system which would have undoubted theoretical advantages. The bimetallic question was also dealt with by the Royal Commission on Agricultural Depression of 1897. In September 1889 a Bimetallic Congress sat in Paris; and, in November 1892, a conference was held at Brussels, on the initiative of the United States, to consider what measures could be taken “to increase the use of silver.” Most of the important States were represented, but no resolution was arrived at.

At this time the fall in the gold price of silver had seriously interfered with the finances of India, where silver was the standard. In May 1893 a committee appointed

by the Government reported in favour of closing the Indian mints to the free coinage of silver, with a view to the establishment of a gold standard. This policy was adopted, but the effects hoped for were not produced as quickly as was anticipated, and a second committee was appointed in 1899. They reported in favour of keeping the mints closed to the free coinage of silver, of maintaining the rupee at a value equivalent to 16 pence, and of taking other steps in the direction of establishing a gold standard in India. The bimetallicists were much dissatisfied with these decisions.

Bimetallicism has in recent years attracted more attention in the United States than anywhere else. Although gold had been adopted for some time as the standard of value, nevertheless in 1878 the Government of that country commenced a systematic coinage of silver without regard to the quantity of silver coin required by the nation. This plan was adopted partly because it was regarded as a step in the right direction by convinced bimetallicists; partly as a result of pressure applied by the silver-producing States, and partly through the unreasoning advocacy of "cheap and abundant money." The agitators were not satisfied, and in 1889 and 1890 the agitation in favour of the free coinage of silver became formidable. In the latter year, as a further palliative measure, the Sherman Act was passed, by which the Treasury was bound to purchase a large quantity of silver every month. This Act was repealed in 1893. The agitation, however, continued in full force, and the presidential election of 1896 turned largely on the bimetallic question. Mr McKinley, the Republican candidate, upheld the maintenance of the gold standard, but only until an international agreement should sanction the free coinage of silver. Mr Bryan, the Democratic candidate, was in favour of the free coinage of silver at a ratio of 16 to 1, without waiting for the co-operation of other nations, and used the famous phrase, "You shall not crucify mankind on a cross of gold." McKinley was elected by a large majority, and in his inaugural address again expressed his adherence to international bimetallicism. In 1897 the Wolcott Commission visited Europe, and advocated the reopening of the Indian mints; but their mission produced no results. In 1898 the Spanish war drove the currency question, for the time being at all events, out of the field of American politics. In 1900 its revival by Mr Bryan produced no effect on the Presidential contest, except perhaps in rendering the re-election of Mr McKinley the more overwhelming.

The above are the principal events connected with the bimetallic controversy in recent years. It is far more difficult to indicate with any certainty the changes of opinion which have taken place during this period. Perhaps a majority of economists now admit the validity of the theoretical arguments brought forward by bimetallicists to prove that the relative value of gold and silver might, within limits, be fixed by legislation. Many keen opponents of bimetallicism, who believe that legislative arrangements would break down in practice, agree with those monometallic members of the Gold and Silver Commission of 1888, who admitted that "in any conditions fairly to be contemplated in future, a stable ratio might be obtained if" the United Kingdom, Germany, the United States, and the Latin Union "were to accept and strictly adhere" to bimetallicism at a ratio approximating to that obtaining in the market. On the other hand, though bimetallicism thus defined would probably tend to increase the stability of the standard of value, yet Prof. Edgeworth has given reasons for believing that no great change would be produced in this respect. The benefits thus obtained would be much the same in the long run whatever ratio of value were adopted. But it is evident

from the writings of bimetallicists that, with few exceptions, they would only be satisfied with such a ratio as would cause a great inflow of silver into the currency of the world; and, as this would certainly tend to make prices rise, it is fair to conclude that the hope of producing this result is the true stimulus which keeps the bimetallic controversy alive. The benefits and evils likely to arise from rising and falling prices have been much discussed. Rising prices would, so it is argued, increase the volume of trade. But in reply it is urged that the main reason for anticipating such a result from an inflation of prices due to currency legislation is that the real wages of labour would thus be reduced, a result in itself always most objectionable. Bimetallicists, however, contend that, even if the labourer should suffer at first, he would gain in the long run because he would eventually share in benefits arising from the increase of trade. At present the value of gold appears to be diminishing, and if the desire for a rise in prices is the true underlying force of the bimetallic movement, this agitation is likely to be less vigorous as long as this fall in the value of gold continues; for the desired effect will thus be produced without the aid of exceptional legislation.

Bimlipatam, a town of British India, in the Vizagapatam district of Madras; situated in 17° 53' N. lat. and 83° 30' E. long., on the sea-coast 18 miles N. of Vizagapatam. Population, about 10,000; municipal revenue (1897-98), Rs.13,840. It was formerly a Dutch factory, and is now the principal port of the district. The anchorage is an open roadstead, with a lighthouse at Santapalli. In 1897-98, the total seaborne trade of this and the subordinate ports amounted to Rs.94,17,240, of which nearly half was conducted with foreign countries. The principal exports are oil-seeds and sugar.

Binang, a town in Luzon, Philippine Islands, on a small river flowing into the Laguna de Bay, and distant about a mile from its western shore. It is one of the most important towns of the province of Laguna, and is surrounded by an extensive and extremely fertile plain, which produces very large quantities of rice, as well as a great variety of tropical fruits. A ready market for these products is found in Manila, which is reached by way of the Laguna de Bay and the Pasig. The language is Tagalog. Population, 20,000.

Binche, a town of Belgium, in the province of Hainaut, 11 miles S.E. of Mons by rail. It has iron- and glass-works, tanneries, and an important industry in boot- and shoe-making, and the making of Brussels lace (*appliqué*) employs many women and girls. Population (1880), 8252; (1897), 11,121.

Bingen, a town of Germany, grand-duchy of Hesse-Darmstadt, on the left bank of the Rhine, 19 miles W. from Mainz. The Rochus chapel, where thousands of persons gather on the first Sunday after 16th August, was rebuilt in 1889-94 after a fire. Of late Bingen has grown in importance as a trading-place, and new quays and a harbour have been built. Coal and iron enter largely into the trade. Population (1885), 7178; (1900), 9670.

Binghamton, capital town of Broome county, New York, U.S.A., situated in 42° 07' N. lat. and 75° 56' W. long., in the southern part of the state, on the north branch of Susquehanna river, at the mouth of the Chenango river, at an altitude of 863 feet. It has three railways: the Delaware and Hudson; the Delaware, Lackawanna, and Western; and the New York, Lake Erie, and Western. The city is built on both sides of both the Susquehanna and the Chenango. It is a manufacturing city of importance. In 1890 the manufacturing capital was \$9,058,651. There were 10,191 persons employed, and the product was valued at \$15,040,152, consisting principally of boots and shoes, flour and tobacco. The last comprised nearly one-fifth of the whole. The assessed valuation of real and personal property was in 1900, \$21,130,730, and the tax rate was \$23.80 per \$1000. The debt was only \$710,555. Since 1880 the city has had a very rapid growth, due probably to increase in railroad communications and in manufactures. Binghamton was named after William Bingham, who purchased the site of the city. The first settlement was made in 1799, under the name of Chenango. In 1834 it was incorporated as the village of Binghamton, and in 1867 received a city charter. Population (1880), 17,317; (1900), 39,647, of whom 4272 were foreign-born. The death-rate in 1900 was 17.6.

Bingley, a market town and railway station in the Otley parliamentary division of Yorkshire, England, on the Aire, 5½ miles N.W. of Bradford. The grammar school has been enlarged, a technical school and free library have been provided, and a cottage hospital has been built. Bradford water-works supply water. Area of urban district, 11,831 acres; population (1891), 17,381; (1901), 18,451.

Bintang, the chief island of the Rhiouw archipelago, on the south side of the Strait of Singapore, in 1° 13' 0" 50' N., 104° 13' 104° 37' E. The Chinese cultivate gambier and pepper successfully, and there is a considerable trade in wood. The seat of the Dutch government is at Tanjong Pinang on the south-west coast, a small port of 4000 inhabitants (160 Europeans and about 2000 Chinese).

Bio-bio, a province of Southern Chile, situated between 37° 15' and 38° 40' S. lat., and 71° 05' and 73° 02' W. long. Its area is 4158 square miles. The population in 1895 numbered 88,749. The capital, Los Angeles, had a population of 7868 in 1895. The province is divided into three departments.

Birbhum, a district of British India, in the Burdwan division of Bengal, situated in the Gangetic plain and partly on the hills, being bounded on the south by the river Ajai. The administrative headquarters are at Suri, which is the only town in the district. The area comprises 1752 square miles. The population in 1881 was 792,031; in 1891, 798,274, giving an average density of 455 persons per square mile. Classified according to religion, Hindus numbered 593,602; Mahomedans, 169,752; aborigines, 34,289; Christians, 542, of whom 68 were Europeans; "others," 89. In 1901 the population was 901,223, showing an increase of 13 per cent. The total amount of land revenue and rates is returned at Rs.10,84,185; the number of police at 272; the boys at school (1896-97) were 24,165, being 41.3 per cent. of the male population of school-going age; the registered death-rate in 1897 was 29.7 per thousand. The principal industry is the spinning and weaving of silk, chiefly from tussar or jungle silkworms. In 1897 the total out-turn of silk was valued at Rs.22,85,100. There are also seven lac factories, whose produce is valued at Rs.26,700. The loop-line of the East Indian

railway runs through the district for 68 miles, with a junction at Nalhati for Murshidabad.

Birch, Samuel (1813-1885), English Egyptologist and antiquary, was born 3rd November 1813, and was the son of the rector of St Mary Woolnoth, London. From an early age he manifested a tendency to the study of out-of-the-way subjects, and after a brief employment in the Record Office obtained in 1836 an appointment in the Antiquities Department of the British Museum on account of his knowledge of Chinese. He soon extended his researches to Egyptian, and when the cumbrous department came to be divided he was appointed to the charge of the Egyptian and Assyrian branch. In the latter language he had assistance, but for many years there was only one other person in the institution—in a different department—who knew anything of ancient Egyptian, and the entire arrangement of the department devolved upon Birch. He found time nevertheless for Egyptological work of the highest value, including a hieroglyphical grammar and dictionary, translations of *The Book of the Dead* and the Harris papyrus, and numerous catalogues and guides. He further wrote what was long a standard history of pottery, investigated the Cypriote syllabary, and proved by various publications that he had not lost his old interest in Chinese. Paradoxical in many of his views on things in general, he was sound and cautious as a philologist; while learned and laborious, he possessed much of the instinctive divination of genius. He died on 27th December 1885. (R. G.)

Birds.—The first attempt at a classification of birds based upon the theory of descent—in fact the first phylogenetic tree of the Class of birds—is due to E. Haeckel (*Generelle Morphologie der Organismen*, vol. ii. p. 139, Berlin, 1866), who divided the whole Class into two Sub-classes: *Saururæ* and *Ornithuræ*, the latter into the two legions of *Autophagæ* s. *Nidifugæ* and *Pædotrophæ* s. *Insessores*. His further Sub-divisions or Orders are significant, since they are accompanied by short hints as to probable lines of development and mutual relationship of the various Orders. With Huxley, "On the Classification of Birds . . ." *Proc. Zool. Soc.*, 1867, pp. 415-472, began the earnest search for anatomical characters as affording the only trustworthy clue to the natural system. His concise diagnoses of the Orders and Sub-orders are based upon various other characters besides those yielded by the palatal bones. He took pains to show that the lineal sequence of his groups does not, and cannot, indicate their relationship, and he published a separate phylogenetic outline (*Ibis*, 1868, pp. 357-362). A. H. Garrod expected much from the combination of a few anatomical characters which were taken from the various organic systems, and which presumably could not stand in direct correlation with each other—notably the carotid arteries, the configuration of the nasal bones, the oil-gland, cæca, and, above all, certain muscles of the thigh. Laying, however, more stress upon the mere presence or absence than upon the quality of these characters, and using their combinations in a rather mechanical way, his ultimate system (published in *Proc. Zool. Soc.*, 1873, pp. 624-644, and 1874, pp. 111-113) resulted in a failure. He was, however, the first to show clearly the relationship of the heron-like birds with the *Steganopodes*, of the stork-like birds with the American vultures, the great difference between the latter and the other birds of prey, the connexion of the Gulls and Auks with the Plovers, and that of the Sandprouse with the Pigeons—discoveries expressed in the newly-established terms of the Orders *Ciconiiformes* and *Charadriiformes*. Garrod, his equally short-lived successor W. A. Forbes,

and F. E. Beddard, have amassed a vast amount of anatomical facts, giving a new impetus to ornithotomy at home and abroad. New light was in the meantime thrown upon the whole study of scientific ornithology by the discovery of the remains of toothed birds in the Cretaceous deposits of Kansas. The results of the indefatigable labours of the late O. Marsh were published by him in his grand volume, *Odontornithes* (Washington, 1880). In 1884 Prof. A. Newton (see *Ency. Brit.* vol. xviii. pp. 43-49) made an attempt to indicate those points in recent classifications which then seemed to have been established on a pretty sure footing, though therein he had no intention of inventing (as has sometimes been supposed) a new system of birds. He broke up the unnatural assembly of the *Odontornithes*, separated the *Striges* entirely from the *Accipitres*, and showed by many suggestions, and by critical discernment in the acceptance of the results of other workers, that the old-fashioned traditions have been given up, and that no classification can hope for recognition unless it be based upon the consideration of as many anatomical characters as possible. This principle was also recognized by L. Stejneger, who in the fourth volume of *The Standard Natural History* (Boston, 1885) brought out an elaborate, and to a great extent new, classification. It is eclectic, the author having welded together what seemed to him well established by other taxonomists, in addition to a careful compilation from the available literature of whatever characters he considered taxonomically serviceable. Anatomy, eggs, nesting habits, food, geographical distribution, have all been laid under contribution, and on the purely anatomical characters he laid in some cases more stress than would have been done by comparative anatomists. His classification stands as follows:—

Sub-class I. *Saururæ*. Order ORNITHOPAPPI: Archaeopteryx. Laopteryx.

Sub-class II. *Odontotormæ*. Order PTEROPAPPI: Ichthyornis. Apatornis.

Sub-class III. *Odontocholæ*. Order DROMOPAPPI: Hesperornis. Enaliornis.

Sub-class IV. *Eurhipiduræ*. Super-order I. DROMOGNATHÆ, with the Orders *Struthionæ*, *Æpyornithes*, *Apteryges*, *Crypturi*, *Gastornithes*.

Super-order II. IMPENNES. Order *Phliopteri*: Spheniscidæ.

Super-order III. EUORNITHES, divided into 13 Orders with 31 Super-families.

(1) *Cecomorphæ*: Colymboideæ, Heliornithideæ, Alcoideæ, Laroidæ, Procellarioidæ; (2) *Grallæ*: Ohionideæ, Scolopacoidæ, Eurypygoidæ, Cariamoidæ, Gruoidæ; (3) *Chenomorphæ*: Anhimoidæ [Palamedæ], Anatoidæ, Phœnicopteroideæ; (4) *Herodii*: Ibioidæ, Ardeoidæ; (5) *Steganopodes*: Phœthontoideæ, Fregatoidæ, Pelecanoidæ; (6) *Opisthocomi*; (7) *Gallinæ*; (8) *Pterocides*; (9) *Columbæ*; (10) *Accipitres*; (11) *Psittaci*; (12) *Picariæ*: Cuculoidæ; Coracioidæ with Steatornithidæ, Podargidæ, Caprimulgidæ, Coraciidæ, Leptosomatidæ; Colioidæ; Alcedinoidæ with Meropidæ, Todidæ, Momotidæ, Alcedinidæ, Bucerotidæ; Upupoidæ with Upupidæ and Irisoridæ; Picoideæ with six families, including Bucconidæ and Galbulidæ; Trogonoidæ; Micropoidæ with Cypselidæ and Trochilidæ; (13) *Passeres*: Menuroideæ; Eurylæmideæ; Tyrannoidæ; Formicaroidæ; Passeroideæ.

The establishment of *Eurhipiduræ* as a Sub-class, the isolation of the *Impennes*, and their elevation to the rank of a Sub-order are anatomically unjustifiable. The *Procellariæ* are put into one Super-family with the Auks and Gulls, while the latter are separated from their close allies the *Scolopacoidæ*. The Owls still remain with the *Accipitres*, and the great difference between the *Cathartæ* and the other birds of prey is not indicated. *Opisthocomus* is relegated to a position lower than the *Gallinæ*. The Ibises form a Super-family, while Storks and Herons are each reduced to family rank. On the other hand, the arrangement of the Orders *Grallæ*, *Picariæ*, and *Passeres* marks a decided progress.

The year 1888 heralded a new epoch in scientific ornithology. Prof. M. Fuerbringer's *Untersuchungen zur Morphologie und Systematik der Voegel*, published as a jubilee work by the "Natura Artis **Fuerbringer.** Magistra" Society of Amsterdam, is a monumental production. The first of the two gigantic volumes is devoted chiefly to a minute description of the bones, muscles, and nerves of the region of the shoulder-girdle. The second volume contains the results, not only from the standpoint of the pure morphologist, but also with a view to their applicability to a systematic arrangement of birds. The author, fully aware of the impossibility of deducing a sound classification from the study, be it ever so minute, of one organic system, or of part of the body only (in the present case of the region of the shoulder-girdle), reviewed also the enormous literature relating to most other organs, sifting and tabulating whatever characters could possibly be of taxonomic value. Being a highly accomplished morphologist, he distinguished especially in the muscular, nervous, and skeletal systems, between primary and secondarily acquired features, and he produced an entirely new, strictly genealogical system, logically worked out. He grouped the recent and extinct birds into about 46 Gentes, groups which, with few exceptions, will stand the test of time. These 46 Gentes are combined into 24 Sub-orders, including no less than 9 intermediary Sub-orders. The latter are the weak spot in his system. Since it is left undecided to which of the principal 8 Orders they belong, the 8 Orders lose much in practical value; and this is all the more to be regretted as Fuerbringer has given us entirely new views by his establishment of these greater and greatest Groups. Moreover, he gives no diagnoses of either Orders, or Sub-orders, or Gentes, or Families, but leaves the reader in the embarrassing position of drawing his own conclusions, after the perusal of pages and pages of detail, in which every imaginable view has been discussed, or at least hinted at. Consequently only those who are well trained in anatomy will, by attentive study, derive the full benefit from this monumental and most suggestive work. It has already become, and will remain, an inexhaustible fount of information, not always acknowledged. There is, lastly, another difficulty, not very patent. The work took several years to get through the press, and during this time the author found it necessary to modify, and even to change completely, some of his views on the systematic position of several groups, notably the relationship of *Hesperornis*, *Palamedæ*, and *Ratitæ*. Hence there are discrepancies in the second volume, not easily understood and reconciled with his final very determined views, unless the reader does not shirk the laborious task of following up the argumentations which are often separated by hundreds of pages. Fuerbringer was the first to show clearly that the *Ratitæ* are the retrograde descendants of volant ancestors, that the various Groups of existing *Ratitæ* represent cases of convergence, that the *Ratitæ* are as such a polyphyletic Group, and he has gone fully into the interesting question of the development and subsequent loss of the power of flight. The loss took place not only in different Groups, but also at various geological periods. Of course the author does not assign any taxonomic value to such cases of isomorphism. Only a few of the more prominent advances in classification can here be mentioned—the complete separation of *Hesperornis* from the *Ratitæ* and its near relationship with the *Colymbo-Podicipedidæ*; final proof that the *Odontornithes* are not a natural Group; affinity of *Apteryx* with the *Crypturi* and *Ralliformes*; *Sphenisci* recognized as allied to the *Tubinares* and *Steganopodes*; establishment of the Group *Coraciiformes*.

Fuerbringer's classification stands as follows. The 90 families have here been omitted for want of space, save those, the assigned position of which is of particular interest:—

Sub-class I. *Saururæ*. Order ARCHORNITHES. Gens. Archæopteryges.

Sub-class II. *Ornithuræ*.

Order.	Sub-order.	Gens.
STRUTHIORNITHES . . .	<i>Struthioniformes</i> . . .	Struthionæ.
RHEORNITHES . . .	<i>Rheiformes</i> . . .	Rheæ.
HIPPALECTRYORNITHES . . .	<i>Casuariiformes</i> . . .	Casuarii.
Intermediary Sub-orders.		
PELARGORNITHES . . .	<i>Æpyornithiformes</i> . . .	Æpyornithes.
	<i>Palamedeiformes</i> . . .	Palamedæ.
	<i>Anseriformes</i> . . .	{ Gastornithes. Anseres.
	<i>Podicipitiformes</i> . . .	{ Enaliornithes. Hesperornithes. Colymbo-Podicipites. Phœnicopteri. Pelargo-Herodii. Accipitres. Steganopodes.
	<i>Ciconiiformes</i> . . .	
Intermediary Sub-orders.		
CHARADRIORNITHES . . .	<i>Procellariiformes</i> . . .	Tubinares.
	<i>Aptenodytiformes</i> . . .	Impennes.
	<i>Ichthyornithiformes</i> . . .	Ichthyornithes.
	<i>Charadriiformes</i> . . .	{ Laro-Limicolæ. Paræ. Otides.
Intermediary Sub-orders.		
ALECTORORNITHES . . .	<i>Gruiformes</i> . . .	{ Eurypygæ, including Rhinocetus, Aptornis. Gruæ.
	<i>Ralliformes</i> . . .	{ Fulicariæ (Heliornithidæ + Rallidæ). Hemipodii (Mesitidæ + Hemipodidæ).
	<i>Apterygiformes</i> . . .	Apteryges (including Dinornithidæ).
	<i>Crypturiformes</i> . . .	Crypturi.
	<i>Galliformes</i> . . .	Galli (including Opisthocomidæ).
Intermediary Sub-orders.		
CORACORNITHES . . .	<i>Columbiformes</i> . . .	{ Pterocletes. Columbæ.
	<i>Psittaciformes</i> . . .	Psittaci.
	<i>Coccygiformes</i> . . .	{ Coccyges. Galbulæ.
	<i>Pico-Passeriformes</i> . . .	{ Pico-Passeræ . . . { Pici Passeræ . . . { Pseudoscines. Passeridæ.
	<i>Coliiformes</i> . . .	Coli.
	<i>Halcyoniformes</i> . . .	{ ? Trogones. Halcyones. Bucerotes (Bucerotidæ + Upupidæ). Meropes. ? Todi (Todidæ + Momotidæ).
	<i>Coraciiformes</i> . . .	{ Coraciæ. Caprimulgi. Striges.

Another comprehensive work on the anatomy and classification of birds, which has appeared since the publication of Professor Newton's article ORNITHOLOGY (*Encyclopædia Britannica*, vol. xviii.), is the volume *Aves of Bronn's Classen und Ordnungen des Thierreichs*. Begun originally by E. Selenka, the anatomical part was taken up in 1884 by H. Gadow, by whom it was completed in 1891, and in 1893 it was followed by the systematic part. Harmonious intercourse with Fuerbringer and the benefit of the latter's work enabled the present writer not only to continue the same lines of morphological research, but also further to investigate those questions which were still left in abeyance or seemed to require renewed study. The resulting "classification is based on the examination, mostly autoptic, of a far greater number of characters than any that had preceded it; moreover, they were chosen in a different way, discernment being exercised in sifting and weighing them, so as to determine, so far as possible, the relative value of each, according as that value may vary in different groups, and not to produce a mere mechanical 'key' after the fashion become of late years so common" (Newton's *Dictionary*

of Birds, Introduction, p. 103). It is not the quantity but the quality of the anatomical and bionomic characters which determines their taxonomic value, and a few fundamental characters are better indications of the affinities of given groups of birds than a great number of agreements if these can be shown to be cases of isomorphism or heterophyletic, convergent analogy. Nature possesses three great educational or developmental schools—terrestrial, aquatic, and aerial life. Each of these affords animal, vegetable, or mixed diet. Animal diet implies the greatest variety with regard to locality and the modes of procuring the food. Each of these schools impresses its pupils, in the case of the birds, with its own stamp, but there are many combinations, since in the course of phyletic development many a group of birds has exchanged one school for another. Originally terrestrial groups have taken to an entirely aquatic life, and *vice versa*; others, originally endowed with the power of flight, have become, or are transforming themselves into, absolutely cursorial forms; some members of one group live entirely on seeds, while others have become fierce fishers, and so forth. Only by the most careful inquiry into their history can

their relationship or pedigree be unravelled. Gadow's system is given below.

NEWTON'S *Dictionary of Birds*, 1893-96, is the latest standard work on ornithology. Under its various headings, anatomical, bionomic, geographical, historical, and systematic, and in the 120 pages of the introduction, it contains condensed accounts of, or at least references to, wellnigh everything which pertains to ornithology.—H. SEEBOHM. *Classification of Birds*. London, 1890. Based upon Fuerbringer and not a genetic system, with "diagnoses" based upon mechanical combinations of striking, but often arbitrarily selected characters.—R. B. SHARPE. *A Review of Attempts to Classify Birds*. Budapest, 1891. Likewise based upon Fuerbringer and not genetic. Simply a linear arrangement of well-selected groups, with enumeration of anatomical and bionomic characters selected from Stejneger and Seebohm. Dr Sharpe is also the author of by far the greater number of volumes of the *Cat. Birds, Brit. Mus.*, a gigantic descriptive work which was finished in 1898.—S. G. MIVART. *The Elements of Ornithology*. London, 1892.—F. E. BEDDARD. *Structure and Classification of Birds*. London, 1898.—H. H. EVANS. *Birds, Cambridge Natural History*, vol. ix. London, 1899.

Much had naturally been expected from the study of fossil birds, but, so far as the making of classifications is concerned, they have proved rather a source of perplexities. So long as the characters of new fossils are only of specific and generic value, it is mostly possible to assign the birds to their proper place, but when these characters indicate new Families or Sub-orders, for instance *Hesperornithes*, *Ichthyornithes*, *Palæolodi*, their owners are put outside the more tersely constructed classifications applicable to modern birds. It is no exaggeration to say that the genus, often even the species, can be determined from almost any recent bone, but in the case of Miocene, and still more, of Eocene fossils, we have often to deal with strange Families, which either represent an extinct side branch, or which connect several recent Groups with each other. Our artificially-established classifications collapse whilst we gain further insight into the mutual affinities of the existing Groups. Of course this must be so if evolution is true. But it also follows that, if every extinct and recent bird were known, neither Species, nor Genera, nor Families, nor Orders could be defined. We should be able to construct the pedigree of every Group, in other words, the gigantic natural system, but there would be no classification. Much light has also been thrown by fossil birds upon the study of geographical distribution. The key to the distribution of recent groups lies in that of the extinct forms. Not only have many absolutely new Families been discovered, but many kinds of modern birds are now known to have existed also in countries where they are now extinct. There were, for instance, trogons, secretary-birds, parrots, and other now Ethiopian forms in Miocene France. Ostriches, undistinguishable from *Struthio*, have been found in Samos and in the Sivalik Hills.

The proper study of fossil birds may be said to have begun with the late A. Milne-Edwards, whose magnificent *Oiseaux fossiles de la France* was published from 1867-71. This work deals chiefly with mid-Tertiary forms. A new impetus was given by the late O. Marsh, who, as we have seen, since 1870 discovered a great number of bird remains in the Cretaceous strata of North America. The most important result is the proof that until the end of the Cretaceous epoch most, if not all, birds were still possessed of teeth. In 1877 a second specimen of *Archæopteryx* was discovered. This Berlin specimen supplements our knowledge of that in the British Museum. It has been fully described by W. Dames in *Palæontolog. Abhandl.* bd. ii. pt. 3, Berlin, 1884. *Archæopteryx* is already a typical bird, possessed of the power of flight, owing to the transformation of its anterior extremities into typically avine wings with remiges. It still retains various very archaic characters,

e.g., teeth, amphiœlous vertebræ, those of the tail numbering about twenty, and although they carry about twelve pairs of well-developed rectrices, they are not yet condensed into a pygostyle. The latter character is, however, of no absolutely distinctive value, it being only peculiar to the majority of the *Carinatae*. Hence the inadvisability of retaining the term *Saurura* in opposition to *Ornithura*. *Archæopteryx* has only slightly narrowed the enormous gap between birds and reptiles. The attempt to look for the ancestors of birds among the Pterosauria is as futile as the various attempts to seek them amongst any of the known groups of Dinosauria. A great number of other fossil birds has been described from various parts of the world, notably by Cope, Fraas, Lund, Lydekker, Seeley, &c., but the most recent and bewildering mass of new forms was discovered by Ameghino chiefly in mid-Tertiary strata of Argentina (see *Revista Argentina de Historia Natural*, i. 1891; *Boletín del Inst. Geograf. Argentín.* xv., 1895; and the sumptuous publication in the *Anales del Museo de la Plata*, 1891, by F. P. Moreno and A. Mercet). Many of the bones indicate birds of gigantic size, and they were collectively called *Stereornithes* by Moreno, who not unnaturally considered them as allied to the *Ratitæ*. Some of these birds were undoubtedly flightless. The most remarkable genus is *Phororhacos*, with an enormous skull of more than two feet in length. Renewed investigation by Mr Andrews of some of the material now in the British Museum has shown that *Stereornithes* has to be abolished as a taxonomic group. *Phororhacos* belongs to the early *Gruiformes*, perhaps with *Pelecyornis* and *Liornis*. *Dryornis* seems to belong to the *Cathartæ*, anyhow to the *Falconiformes*, while *Mesembriornis* is a direct forerunner of the present *Rheæ*.

In conclusion, the present writer gives his classification of birds in which the extinct forms have been intercalated so far as possible. The few characters assigned to the various groups are sufficiently diagnostic when taken together, although they are not always those upon which the classification has been established:—

CLASS AVES.

I. Sub-class **Archæornithes**.—The three fingers and their metacarpals remain separate, each with a claw. Well-developed remiges. Both jaws with alveolar teeth. Amphiœlous. Caudal vertebræ more than thirteen, without a pygostyle, but with about twelve pairs of rectrices. *Archæopteryx*, *A. lithographica*, s. *macroura*, and *A. siemensii*, two specimens from the upper Oolite of Solenhofen, Bavaria.

II. Sub-class **Neornithes**.—Metacarpals fused. Second finger the longest. Not more than thirteen caudal vertebræ.

I. Division **RATITÆ**.—Terrestrial, flightless. Without sternal keel. Quadrate bone with single proximal knob. Without pygostyle. Coracoid and scapula fused. Compound Rhamphotheca. Adult without apteria. With copulatory organ. A collective polyphyletic or heterogeneous group, originally cosmopolitan; with certainty existing since the Miocene.

1. Order **Struthionæ**.—With pubic symphysis. Two toes only, third and fourth. *Struthio*, ostrich, Miocene of Samos, Pliocene of north-west India, now Africa and Arabia.
2. Order **Rheæ**.—With long ischiadic symphysis. Three toes. *Mesembriornis*, miocene or pliocene of Argentina. *Rheæ*, South America.
3. Order **Casuarii**.—Three toes. Aftershaft as long as the other half. *Casuarus* and *Dromæus*, Australian region. *Hypselornis*, Pliocene of Sivalik Hills.
4. Order **Apteryges**.—Four toes. Bill long and slender. New Zealand.
5. Order **Dinornithes**.—Three or four toes. Bill short. Anterior

- extremities extremely reduced. *Dinornis*, numerous species, recently extinct, New Zealand.
6. Order *Æpyornithes*.—*Æpyornis*, recently extinct, Madagascar. To the *Ratitæ* belong possibly also the imperfectly known *Diatryma*, Eocene of New Mexico, *Gastornis* and *Dasornis*, Eocene of Europe, *Gemynornis* of Pleistocene, Australia.
- II. Division ODONTOLCÆ.—Marine, flightless, without sternal keel. Upper and lower jaws with teeth in furrows. Cretaceous epoch. *Enaliornis*, England, vertebræ chiefly biconcave; *Hesperornis*, North America, vertebræ heterocœlous.
- III. Division CARINATÆ.—With keeled sternum.
1. Order *Ichthyornithes*.—Power of flight well developed. Vertebræ still amphicœlous. With small pygostyle. Incisura ischiadica. With alveolar teeth. Cretaceous. *Ichthyornis*, *Apatornis*.
2. Order *Colymbiformes*.—Plantigrade, nidifugous, aquatic. All toes webbed, fourth largest, hallux short; metatarsus laterally compressed; tibia with high, pyramidal crest. Bill straight, pointed, with simple sheath.
- Sub-order 1. COLYMBI. Divers. Front toes completely webbed. Periarctic. *Colymbus*.
- Sub-order 2. PODICIPEDES, Grebes. Toes lobated. Cosmopolitan.
3. Order *Sphenisciformes*.—Nidicolous, marine. Flightless, wings transformed into rowing paddles. SPHENISCI, penguins. Antarctic and southern temperate coasts. Since the Eocene.
4. Order *Procellariiformes*.—Well flying, pelagic, nidicolous. Hallux absent or vestigial. Rhamphotheca compound. Cosmopolitan. TUBINAE, petrels and albatrosses.
5. Order *Ciconiiformes*.—Swimmers or waders. Desmognathous, without basipterygoid processes; with one pair of sterno-tracheal muscles.
- Sub-order 1. STEGANOPODES.—Well flying, aquatic, nidicolous; with all the four toes webbed together. Rhamphotheca compound; cosmopolitan. *Phaethon*, tropic-bird; *Sula*, gannet; *Phalacrocorax*, cormorant, and *Plotus*, snake-bird; *Fregata*, frigate-bird; *Pelecanus*. Here also *Pelagornis*, Miocene of France; *Argillornis* and probably *Odontopteryx* from the London Clay.
- Sub-order 2. ARDEÆ.—Piscivorous, nidicolous, waders; with complicated hypotarsus and with long cervical apteria. *Ardeide*, cosmopolitan; including *Cancroma*, *Balaeniceps*, *Scopidae*, Ethiopian. *Proherodias*, Eocene of England.
- Sub-order 3. CICONIÆ.—Carnivorous, nidicolous, waders; with simple hypotarsus and without cervical apteria. Cosmopolitan. *Ciconiidae*, storks. *Ibidae*, ibises and spoonbills. *Propelargus*, Oligocene.
- Sub-order 4. PHŒNICOPTERI.—Flamingos. Nidifugous, waders; without simple hypotarsus and without cervical apteria. Front toes completely webbed; hallux very short or absent; vegetable feeders, chiefly confervæ. *Phœnicopterus*, cosmopolitan. Oligocene *Elornis* and, allied, *Palæolodus*.
6. Order *Anseriformes*.—Desmognathous, nidifugous; with two pairs of sterno-tracheal muscles, with complete basipterygoid processes and with a penis.
- Sub-order 1. PALAMEDEÆ.—Screamers. Ribs without uncinate processes. Hypotarsus simple. Neotropical. *Chama*, *Palamedea*.
- Sub-order 2. ANSERES.—Family Anatidæ. Hypotarsus complex. *Anser*, *Anas*, *Cygnus*, since Miocene. *Cnemidornis*, Pleistocene, New Zealand, flightless.
7. Order *Falconiformes*.—Birds of prey. Carnivorous, desmognathous, nidicolous, without functional cæca. Terrestrial, aerial.
- Sub-order 1. CATHARTÆ.—American vultures. With nares perviæ. *Catharistes*, condor; *Cathartes*.
- Sub-order 2. ACCIPITRES.—With nares perviæ. *Gypogera*, secretary-bird, Ethiopian; Miocene, France. *Vulturidae*, Old World vultures, excluding Australia. *Falconidae*, cosmopolitan, since the Eocene. *Harpagornis*, Pleistocene, New Zealand; *Lithornis*, Eocene, England. *Pandionidae*, pandion.
8. Order *Tinamiformes*.—Nidifugous, with incisura ischiadica, without pygostyle. Herbivorous, terrestrial, neotropical. *Crypturi*, tinamous.
9. Order *Galliformes*.—Schizognathous, herbivorous, terrestrial. With ten functional remiges. With strong spinæ sterni.
- Sub-order 1. MESITES. Without basipterygoid processes, and with large spina interna. *Mesites*, Madagascar.
- Sub-order 2. TURNICES.—Hemipodes. Nidifugous; vomer large; sternum without processus obliqui. Hallux absent or vestigial. Old World. *Turnix*, *Pedionomus*.
- Sub-order 3. GALLI.—With large spina communis, and with large processus obliqui. Hallux functional. *Megapodidae*, Australian region. *Cracidae*, curassows and guans, neotropical. *Gallide*, cosmopolitan.
- Sub-order 4. OPISTHOCOMI.—Arboreal, with long spina externa; without basipterygoid processes. *Opisthocomus*, hoatzin, Guiana and Venezuela.
10. Order *Gruiformes*.—Legs of the wading type. Without basipterygoid processes. Without spina interna. Nidifugous. Essentially schizognathous. *Rallidae*, cosmopolitan, since Oligocene. *Rallus*, *Fulica*, *Ocydromus*, &c., *Gallinula nesiotis*, Tristan d'Acunha, flightless. *Notornis*, New Zealand, flightless, nearly extinct. *Aptornis*, New Zealand, flightless, extinct. *Aphanapteryx* (Mauritius) = *Erythromachus* (Rodriguez) = *Diaphorapteryx* (Chatham Island), flightless and recently extinct. *Gypsornis*, upper Eocene, France. *Gruide*, cranes, cosmopolitan, allied *Phororhacos*, Tertiary of Argentina. *Dicholophidae*, cariamas, neotropical. *Otididae*, bustards. *Rhinocetidae*, kagus, New Caledonia. *Eurypygidæ*, sun-bittern, neotropical. *Heliornithidae*, finfoots, tropical.
11. Order *Charadriiformes*.—Schizognathous. With eleven remiges, of which the terminal very short. Aquinto-cubital. Spinæ sterni short, separate.
- Sub-order 1. LIMICOLÆ.—Nidifugous, without spina interna sterni. Hypotarsus complicated. *Charadriidae*, plovers. *Chionidae*, sheath-bill. *Glareolidae*, wading swallows and coursers. *Thinocorytidae*, seed-snipes. *Ebidenemidae*, thick-knees. *Parridae*.
- Sub-order 2. LARI.—Aquatic, vomer complete. Without basipterygoid processes. Front toes webbed; hallux small or absent. Large supraorbital glands. Since Miocene. *Laridae*, gulls, cosmopolitan. *Alcidae*, auks, northern half of periarctic region.
- Sub-order 3. PTEROCLES.—Sand-grouse. Nidifugous. Vomer vestigial. With large crop and cæca. Hallux vestigial or absent. Africa to India. *Pterocles* and *Syrhaptes*.
- Sub-order 4. COLUMBÆ.—Pigeons. Nidicolous. Vomer vestigial. With large crop, vestigial cæca. *Columbidae*, cosmopolitan, since Miocene. *Dididae*, flightless, recently extinct. *Didus*, dodo, Mauritius. *Pezophaps*, solitaire, Rodriguez.
12. Order *Cuculiformes*.—Desmognathous, nidicolous; zygodactylous, or with the outer toe reversible.
- Sub-order 1. CUCULI.—Cuckoos. Quinto-cubital. *Cuculidae*, cosmopolitan. *Muscophagidae*, plantain-eaters and touracos, Ethiopian.
- Sub-order 2. PSITTACI.—Parrots. Zygodactylous; aquinto-cubital. Cosmopolitan, chiefly tropical. *Trichoglossidae*, lories, Austro-Malayan. *Nestor*, New Zealand. *Cyclopsittacus*, *Eos*, *Lorius*, &c. *Psittacidae*, tongue smooth, incl. *Stringops*.
13. Order *Coraciiformes*.—Nidicolous. Nares imperviæ, holohrinal. Down restricted to the apteria or absent. Thirteen to fifteen cervical vertebræ. Mostly desmognathous. Deep plantar tendons connected with each other.
- Sub-order 1. CORACIÆ.—Either (1) with long spina externa sterni, and *Coraciidae*, rollers, Old World. *Momotidae*, neotropical, motmots and todies. *Alcedinidae*, kingfishers, cosmopolitan or (2) with long spina communis. *Meropidae*, bee-eaters, Old World. *Upupidae*, hoopoes and hornbills, palæarctic and palæotropical.
- Sub-order 2. STRIGES.—Owls. Outer toe reversible. Schizognathous. Long cæca. Flexor tendons normal. Hypotarsus simple. Cosmopolitan.
- Sub-order 3. CAPRIMULGI.—Nightjars. Nocturnal. With gaping mouth. Ten remiges and ten rectrices. Spinæ sterni vestigial. Cæca functional. *Steatornithidae*, *Steatornis*, oil-bird or Guacharo, South America. *Podargidae*, Australasian, *Caprimulgidae*, cosmopolitan.
- Sub-order 4. CYPSELI.—Tenth terminal remex the longest. With short spinæ sterni. Without cæca. *Cypselidae*, swifts, cosmopolitan. *Trochilidae*, humming-birds, American.
- Sub-order 5. COLII.—Mouse-birds. First and fourth toes reversible. Ethiopian.
- Sub-order 6. TROGONES.—Trogon. Heterodactyle, first and second toes directed forwards, third and fourth backwards. Tropical. *Trogon gallicus*, Miocene of France.
- Sub-order 7. PICOI.—Zygodactylous. Tendon of the middle flexor hallucis longus sending a strong vinculum to that of the middle flexor profundus, the tendon of which goes to the third toe only. *Gaibulidae*, puff-birds and jacamars, neotropical. *Capitonidae*, barbets, tropical. *Rhamphastidae*, toucans, neotropical. *Picidae*, woodpeckers, cosmopolitan, excepting Madagascar and Australian region.

14. Order **Passeriformes**.—Nidicolous. Ægithognathous, without basipterygoid processes. Spina externa sterni large, spina interna absent. Quinto-cubital, toes normal. Apparently since the upper Eocene.

Sub-order 1. **PASSERES ANISOMYODÆ**.—Syrinx muscles entirely lateral or attached to the dorsal or ventral corners of the bronchial semi-rings. (1) *Subclamatōres*. Deep plantar tendons connected by a vinculum. *Eurylamiæ*, broad-bills, Indian and Indo-Malayan. (2) *Clamatōres*. Deep flexor tendons not connected. *Pittidæ*, palæotropical. *Xenicidæ*, New Zealand. *Tyrannidæ*, *Formicariidæ*, *Pteroptochidæ*, American.

Sub-order 2. **PASSERES DIACROMYODÆ**.—Syrinx muscles of either side attached to the dorsal and ventral corners of the rings. Hallux strong, with a large claw. (1) *Suboscines* with *Menura*, lyre-bird, and *Atrichia*, scrub-bird, in Australia. (2) *Oscines*, the true singing-birds, with more than 4500 recent species, are mostly divided into some thirty "families," few of which can be defined.

The fourteen orders of the Carinatae are further congregated into four "Legions":—

I. **COLYMBOMORPHÆ** = *Ichthyornithes* + *Colymbiformes* + *Sphenisciformes* + *Procellariiformes*.

II. **PELARGOMORPHÆ** = *Ciconiiformes* + *Anseriformes* + *Falconiformes*.

III. **ALECTOROMORPHÆ** = *Tinamiformes* + *Galliformes* + *Gruiformes* + *Charadriiformes*.

IV. **CORACIOMORPHÆ** = *Cuculiformes* + *Coraciiformes* + *Passeriformes*.

These four legions are again combined into two "Brigades," the first of which comprises the first and second legions, while the second brigade contains the third and fourth legions. Thus the whole classification becomes a rounded-off phylogenetic system, which, at least in its broad outlines, seems to approach the natural system, the ideal goal of the scientific ornithologist. The main branches of the resultant "tree" may be rendered as follows:—

The Odontolcæ seem to be an early specialized offshoot of the Colymbo-Pelargomorphous brigade, while the Ratitæ represent a number of side branches of early Alectoromorpha. The Ratitæ branched off, probably during the Eocene period, from that still indifferent stock which gave rise to the Tinami + Galli + Gruiformes, when the members of this stock were still in possession of those archaic characters which distinguish Ratitæ from Carinatae. It follows that new groups of Ratitæ can no longer be developed since there are no Carinatae living which still retain so many low characters, e.g., configuration of the palate, precoracoid, pelvis, intestinal convolutions, copulatory organ, &c. Loss of the keel is coordinated with the power of using the forelimbs for locomotion; although a "Ratite" character, it is not sufficient to turn a *Notornis*, *Chemiornis*, or *Stringops*, not even a *Phororhacos* into a member of the Ratitæ.

Another branch of the Alectoromorpha, in particular of the Galliformes, when these were still scarcely separated from the Gruiformes, especially rail-like birds, leads through Opisthocomi to the Cuculiformes. These are, again in an ascending direction, connected with the Coraciiformes, out of which have arisen the Passeriformes, and these have blossomed into the Oscines, which, as the apotheosis of bird life, have conquered the whole inhabitable world.

(H. F. G.)

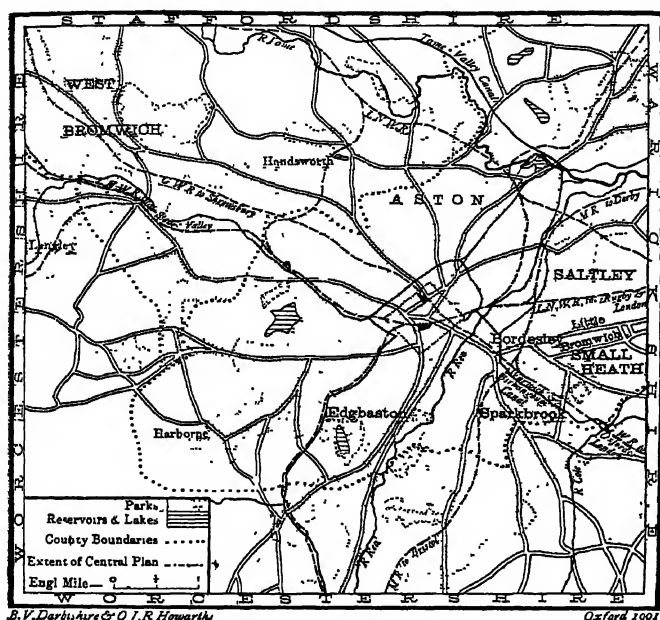

Birejik, or **Bir** (Assyrian *Til Barsip*, classical *Apamea-Zeugma*), altitude 1170 feet, built on a limestone cliff 400 feet high, on the left bank of the Euphrates, in the Aleppo vilâyet. It is situated at one of the most important crossings of the Euphrates, where there was, in ancient times, a bridge of boats, and where there is now a ferry on the caravan route from Aleppo to Diarbekr and Mosul. In the massacres of 1895 most of the Armenians were killed or forced to embrace Islâm. Population before 1895, 9500 (Moslems, 8000; Christians, 1500).

Birkenhead, an English seaport, market town, township, rural deanery, and municipal and parliamentary borough, in the hundred of Wirral and county and diocese of Chester, situated on the western bank of the

river Mersey, directly opposite Liverpool. The boundaries were extended in 1877, and the population nearly doubled between 1871 and 1881, when there were 84,006 inhabitants; in 1901 the population was 111,000. The rateable value increased from £404,578 in 1881 to £547,449 in 1899. On incorporation in 1877, the townships of Tranmere (1071 acres), Oxtan (814 acres), and part of Higher Bebington (246 acres) were included in Birkenhead, the total area of which thus became 3850 acres. The extension coincided with the grant to the town of its municipal charter, and the government is now conducted by a mayor, 14 aldermen, and 42 councillors. Birkenhead has 21 churches belonging to the Established Church, and 41 belonging to various nonconforming bodies. A town-hall and sessions court, built at a total cost of £109,000, were opened in 1887. The water-supply of the town is derived from four pumping stations, all but one inside the borough boundary. The pumping power of the engines is 358,000 gallons per hour, and the total yield per week 27,000,000 gallons. The consumption for 1899 was over 700 million gallons, at an average rate of about 17 gallons per head per day. In 1893 a school board of 15 members was created. It had in 1901 four large schools under its control, with accommodation for 3095 children. Mersey Park, in the south end of the borough, was opened in 1885; a track of moorland, measuring 45 acres, in the township of Thurstaston, at a distance of six miles from Birkenhead, was allotted to the borough as an open space in 1883. In 1900 a portion of a piece of land known as Meols Common, comprising upwards of 54 acres of pasture land, lying on the shore of Liverpool Bay, about three miles from the borough, was vested in the corporation. The Birkenhead ferry service is now carried on by five steamers with a total carrying-capacity of 7356 persons, while the goods traffic is conveyed by three large steamboats. In 1897 the corporation further acquired the rights over the Rock Ferry and the New Ferry, at the south end of the borough. The total number of passengers carried by the ferries in 1899 was 8½ millions. In connexion with the free library, two branch reading-rooms and libraries were opened in 1894. In 1879 lairages to deal with the imported cattle trade were opened by the dock board at Woodside and on the south side of Wallasey Dock, with accommodation for 3164 oxen and 10,000 sheep. During the year ending 31st December 1899, 152,661 oxen and 275,424 sheep passed through these lairages, quite apart from the cattle landed at the North Wallasey Lairage, just outside the borough boundary. Large new abattoirs were opened in 1887. The hospital accommodation of the borough has been increased by the opening in 1883 of an enlarged children's hospital, and in 1895 of a specially commodious infectious diseases hospital at Flaybrick. The supply of electric light is undertaken by the municipal authorities, and the generating works were opened in 1896. The tramway system has been reorganized, in order to be worked by electric traction under the control of the corporation. In 1878 the old Monks Ferry station on the Great Western system was superseded by the opening of the Woodside passenger station, and a few years later the Birkenhead town station was also opened. In 1886 the Mersey tunnel, connecting Birkenhead with Liverpool, was opened by the Prince of Wales. This system extends from Rock Ferry and Park stations on the Cheshire side to the low level at central station in Liverpool, and has connexions on the Cheshire side with the Great Western, London and North-Western, Wirral, and other local systems. In 1896 the Wrexham, Mold and Connah's Quay railway was opened, thus bringing the

mineral and coal districts of Flintshire and North Wales into touch with the Birkenhead docks; a considerable traffic has resulted. A handsome Young Men's Christian Association building and a commodious theatre have been erected. In 1897 the ruins of the ancient Benedictine Priory were purchased by private subscription and presented to the town. They have been carefully restored at the expense of the corporation. The general trade of the borough has increased, and latterly shipbuilding and ship repairing have developed to a considerable extent.

Birmingham, one of the chief manufacturing towns (a county borough) of England, in Warwickshire, 112½ miles (by rail) from London, with an area of about 30 square miles. The greatest length from N.E. to S.W. is about 7 miles, and the greatest breadth a little over 4 miles, the form being roughly oblong. The London and North-Western, the Midland, and the Great Western railways run through Birmingham, the two former having a joint station in New Street, and the latter a separate

station in Snow Hill. The population grew from 360,000 in 1875 to 408,000 in 1881, to 430,000 in 1891, and, certain extensions having been made in the boundaries during the interval, in 1901 was found to be 522,182. The death-rate was 24·8 per 1000 in 1875, 19·1 in 1885, and 20 in 1899. The following table shows the number of births, deaths, and marriages in recent years:—

	Births.	Deaths.	Marriages.
1870	8678	5784	2230
1880	9456	5414	2074
1890	7966	6263	2544
1898	8351	5603	2753

The boundaries and parliamentary representation of the city have undergone considerable changes since 1875. At that date the town (which became a city in 1889) still returned the three representatives assigned in 1867. By the Representation of the People Act of 1885 this number was increased to seven, and a corresponding number of parliamentary divisions created. By the Provincial Local Government Board Act of 1891 four Local Board districts were added to the city of Birmingham for local government—Harborne (Staffordshire), Balsall Heath (Worcestershire), Saltley, and the rural hamlet of Little Bromwich (Warwickshire). These districts were by the Act declared

to be in the county of Warwick, though still remaining in their respective counties for the exercise of freehold votes. By this Act the boundaries of the city were made coterminous for parliamentary, municipal, and school board purposes. No change was made in poor-law areas or in existing ecclesiastical rights. Since 1875 considerable changes have been made in the laying out of principal streets. In the year named a great Improvement Scheme was initiated, with the twofold object of clearing away a mass of insanitary property from the centre of the town (in some parts of which an alarmingly high death-rate prevailed) and of constructing a main thoroughfare from the centre to the N.E. outlet, commencing from New Street, near the principal railway station, to Bull Street, and thence continuing to the Aston Road. The scheme received parliamentary sanction in 1876, and was finished in 1882, the total cost being £1,520,657. This led to an almost total extinction of the residential quarter in the centre of the town. The great thoroughfare thus created is called Corporation Street. It was rapidly lined with buildings of considerable beauty, these being erected on leases of seventy-five years' duration, at the expiration of which they become the property of the Corporation.

The most marked extension of building has been eastwards and southwards in Saltley, Balsall Heath, and Small Heath, and to the N.W. in the direction of the Handsworth boundary, but building sites are being rapidly filled up in all quarters. Edgbaston, the fashionable suburb, owing to the strict rules enforced by the ground landlord, still remains remarkably open, and is an almost unique example of a semi-rural district, where almost every house has a garden, extending to within less than a mile of the centre of a city of more than half a million inhabitants. This feature has had a most important effect in preserving the local life of Birmingham intact, inasmuch as the richer and more influential inhabitants, instead of residing at a distance from the centre, as in so many large towns, remain in close contact with the general community and take a full share in municipal government and the administration of charities. Edgbaston is however becoming partly surrounded by manufacturing districts, specially to the S.W. where the growing districts of Selly Oak and Bourneville, with their ever-increasing factories, interpose between it and the country proper. On the E. side of the city the transition from town to country is well defined, but to the N.W. the exit from Birmingham conducts from one populous district to another. On that side Birmingham has joined hands with the Black Country, nearly the whole of the road to Dudley, 10 miles distant, having the character of a street.

Drainage.—The sewage of the city is dealt with by a body known as "The Birmingham, Tame, and Rea District Drainage Board," constituted in 1877. It consists of nineteen members, of whom twelve are elected from the City Council, the others representing districts outside the municipal area. The total area drained is over 45,000 acres, and is likely to be increased, the whole of the sewers falling to a common outlet at Saltley, adjacent to a sewage farm of 2000 acres in the valley of the Tame. After being purified in tanks by precipitation with lime the fluid matter is passed through the land and issues as clear water into the Tame. The solid residuum is dug into the land. The board has power to serve precepts on the various local bodies included within the area. In 1899 the precept on the Birmingham corporation amounted to £32,725, representing three-fourths the total expenditure of the board.

Lighting and Water.—Both the gas and the water supplies are in the hands of the corporation. The two local gas companies were bought out in 1875. In that year 290,000 tons of coal were carbonized; in 1899 the quantity was 515,000, in addition to which 1,400,000 gallons of oil were also used for gas manufacture. Since 1875 the annual sale of gas has increased from 2327 to 5201 million cubic feet. The capital expenditure has increased from £2,000,000 to £2,283,000, i.e., a reduction of capital per 1000 cubic feet of gas sold from 17s. 8d. to 9s. 2d. £680,000 has been appropriated from the profits of the undertaking, and from the interest on the invested reserve fund, in aid of the rates. The rates in the lighting area have been indirectly relieved by £200,000 by means of reduced charges for public lighting: the Art Gallery building has been provided, and a reserve of £658,000 accumulated. The corporation has taken over the electric supply from 1st January 1900, the purchase money being £420,000. The water was acquired in 1876. In contrast to the gas undertaking, the water has never been looked upon as a profit-making concern, this being expressly disavowed, and the motive of public

policy declared by the promoters of municipalization. The present sources of supply are the rivers Bourne and Blythe, the Plant Brook, and the Perry Stream, and eight deep wells. The works can provide 20 million gallons daily in dry weather. The area supplied covers 129½ square miles, with an estimated population of 800,000. Owing to the rapid increase of demand, a new reservoir has been constructed at Shustoke on the Bourne, with a capacity of 400 million gallons. This brought the total capital authorized up to date to £2,097,860, the whole of which has been raised and expended. In 1891 the demand having risen to nearly 17 millions a day, new sources of supply had to be considered, and it was determined to seek an entirely new supply in Wales. By an Act of 1892 power was given to acquire the watershed of the rivers Elan and Claerwen, tributaries of the Wye in Radnor and Brecon shires, and to construct the necessary works, the capital authorized being £6,000,000. The works for the first instalment of the Welsh scheme are now in hand. These comprise a large storage and compensation reservoir, and two storage reservoirs on the river Elan. The estimate formed in 1891 for the present works was £3,621,950, but the actual cost will be greater. It may be mentioned that the capitalized value of the gas and water undertakings, as regards works now in operation (excluding the Welsh scheme), is about £4,500,000, against which is to be set an accumulated sinking fund amounting to nearly £800,000.

Administration.—In 1883 the various Acts of past years were combined into the Birmingham Corporation Consolidation Act, which gave further powers to erect assize courts, increase the area of gas supply, impose Free Library rate, and conduct a municipal School of Art. The poor-law administration has, since 1875, been put on a more popular basis. In 1882 a superintendent relieving officer was appointed, and a system of cross visitation started for the purpose of checking abuses of outdoor relief. In the same year the Guardians built an infirmary with 1300 beds. In 1878 they decided to build cottage homes in a rural district for the purpose of bringing up permanent pauper children. Each home has 30 inmates under the care of a "foster parent." There are 400 inmates altogether. Workhouses have been thoroughly modernized, the principle of separating children adopted, and infirmaries built. Women first sat on the Board of Guardians in 1880. In 1889 Birmingham was created a city, and a grant made of an official coat-of-arms carrying supporters. The title of lord mayor was conferred on the chief magistrate in 1897. The police force has increased from 500 in 1875 to 700 in 1899. In 1875 the amount of assessment to the borough rate was £1,254,911, the rate being 3s. 10½d. in the £ (of which 3d. was for the School Board), and the income about £300,000. In 1898-99 the income from rates was £535,659 at 5s. 1½d. in the £ on a gross assessment of £2,297,542, and the total debt to be provided for £9,380,000, of which about seven millions is represented by gas and water liabilities and by the dwelling-house improvement fund. The School Board rate for the same year was 1s. 0½d. in the £ (included in the aforementioned 5s. 1½d.). The City Council consists of eighteen aldermen and fifty-four councillors, selected from eighteen wards; it is divided into seventeen committees, most of which consist of eight members. The corporation is the largest employer of labour in the borough; it employs over 5000 persons, and is also a large landowner. The administration of justice was performed from 1838 to 1884 by a Court of Quarter Sessions, with a recorder, and a Court of Petty Sessions. In 1884 Birmingham

was made an assize district of Warwickshire. In connexion with this event new law courts had to be created.

Religion.—The total sittings provided by the various churches of all denominations in Birmingham amount to about one quarter of the total population. In 1892 the Establishment had 108 churches and mission rooms, and other denominations 159 places of worship. This number has not materially changed. Three new churches belonging to the Establishment were consecrated in the period 1875-1897. Since 1897 two more have been consecrated and one commenced; three have been closed, and arrangements made for rebuilding in other districts.

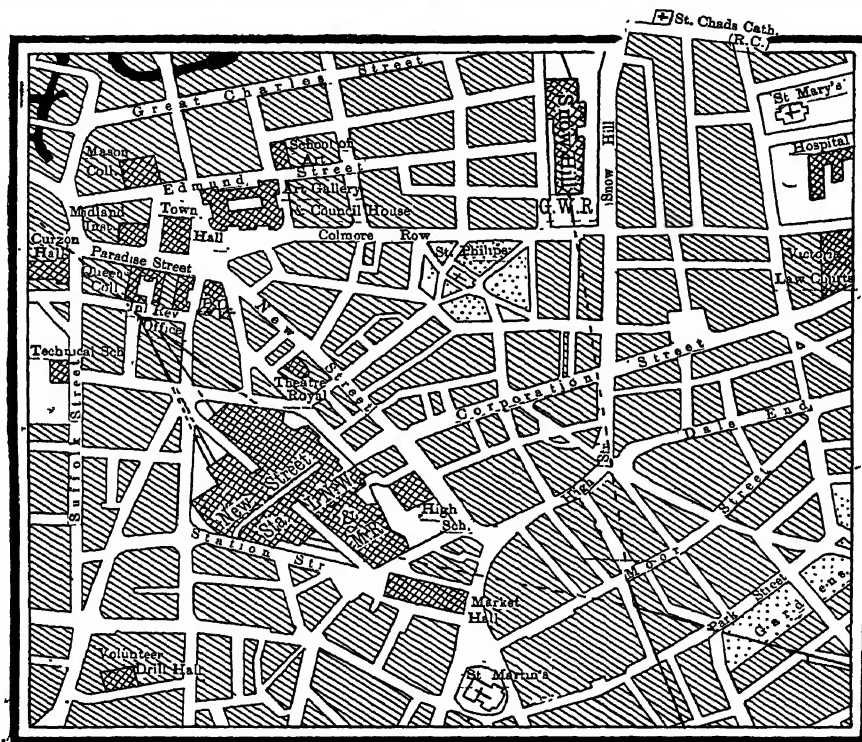

Charities.—The old General Hospital had in 1875, 2000 in- and 25,000 out-patients. This has now been replaced by a splendid new erection on St Mary's Square, which both for external and internal merit ranks amongst the foremost hospitals of the kingdom. The building was commenced in 1894 and finished in 1897 at a total cost of £206,000. In that year the number of in-patients was 4119; out-patients, 54,217. The work of the Queen's Hospital has risen from 1300 and 17,000 in- and out-patients in 1875 to 2020 and 28,559 in 1898. The various medical and other charities mentioned as existing

in 1875 are, with few exceptions, still in operation, and on an increased scale. Most of the hospitals and dispensaries, of which there are now fourteen, have been made free since that date.

Tramways.—The tramways belong to private companies, which hold leases from the corporation. Steam, electric, horse, and cable traction are employed. The total length is over 33 miles. The rent paid to the corporation during the period 1893-1900 was £8762.

Education.—The foundation of the schools of King Edward VI. derive an income, from endowments, of £37,000, as against £15,000 in 1875, and there is prospect of further increase. The principal school—the Boys' High School—is held in the building erected in New Street in 1840. It has a classical and a modern side, and educates about 500 boys. Adjoining it, in a new building

opened in 1896, is a large high school for girls, with 300 pupils. There are also on the foundation seven middle schools, called grammar schools, four for girls and three for boys, situate in different parts of the city, and containing about 1900 pupils altogether. The schools have numerous scholarships tenable at the schools as well as exhibitions to the universities and other places of higher education. *Queen's College*, with its medical and theological departments, was in 1875 flourishing on the former, languishing on the latter side. In 1882 a large part of the scientific teaching, hitherto done by special professors in Queen's College, was taken over by Mason College, and in 1892 the whole medical department was removed to the same institution under an order from the Court of Chancery. This change helped to advance the *Birmingham Medical School* to a position of high repute. The theological students of Queen's College are extremely few. The idea of developing Queen's College into a university had long existed. The idea was destined to be realized in connexion with *Mason College*. The foundation deed (dated 1870) of this college, the first stone of which was laid in 1875, declares the founder's intention to be that of promoting "thorough systematic education and instruction specially adapted to the practical, mechanical, and artistic requirements of the manufactures and industrial pursuits of the Midland district... to the exclusion of mere literary education and instruction." Subsequent deeds (1874 and 1881) added Greek and Latin, and provided that instruction may be given in all such other subjects as the trustees may from time to

PLAN OF CENTRAL BIRMINGHAM.

time judge necessary, while once in every fifteen years the provisions of the deed may be varied to meet changing needs—theology only being definitely excluded. In 1897 a new Act was passed at the instance of the trustees, creating a court of 180 members, and removing the theological restriction. A measure of popular control is given through the appointment by the City Council of five out of the eleven trustees. The college opened in 1880 with 53 students; in 1884-85 the number was 525; in 1898-99 there were 666. In 1898 a public meeting carried a resolution in favour of creating a university. It was estimated that a quarter of a million was needed to endow and equip a university on the scale proposed. Including £50,000 offered by Mr Carnegie, the Pennsylvania iron-master, and an equal amount from an anonymous donor, the rest from local subscribers, in the autumn of 1899, £325,000 had been subscribed, and the Privy Council was at once petitioned for a charter, which was granted. The draft provides for the incorporation of "the University of Birmingham" with faculties of science, arts, medicine, and commerce, with power to grant degrees, and for its government by a court of governors (of which women may be members), a council, and a senate. Mason College is merged in the university. It will be seen that one of the faculties is that of commerce, constituting a distinctive feature in the scheme of the university, the object being to bring its teaching into close touch with the industrial life of the city, the district, and the kingdom. *Elementary education* has passed chiefly into the hands of the School Board. In 1870 the existing voluntary schools provided accommodation for 30,000 children, about half of what was necessary. The School Board was elected for the first time in 1870. In 1898, 88,944 places had been provided, of which 56,868 were in board, and 31,751 in denominational, and 325 in private schools. The percentage of average attendance to the number on the books is about 82 in the denominational and 84 in the board schools. There were fifty-seven schools under the board, exclusive of two special schools for deaf and three for feeble-minded children. There are also under the board sixteen evening continuation schools, nine for boys and men, seven for girls and women; six commercial evening schools, three for each sex. There are two higher-grade schools, with a combined attendance of 585. The cost of the School Board to the rates has now amounted to about £120,000 per annum, and the total expenditure of the board, exclusive of capital, to £200,000 per annum. The *Municipal School of Art* was formed by the transference to the Corporation in 1885 of the then existing School of Art and the Society of Arts, and by the erection of a noble building in Margaret Street, the site having already been given and a portion of the cost provided by private donors. There are one central school and two branch schools. Evening classes are also held in six of the board schools. In 1899 there were 1300 students in the central school and 3828 in the branches and classes. The *Midland Institute* still continues an important work of higher education. A marked development took place in 1885, when, fresh room having been provided by the removal of the School of Art hitherto held in the building, the industrial department was greatly enlarged, resulting in the creation of one of the best metallurgical schools in the kingdom. The present number of students in the industrial department is 2499. On the erection of the Municipal Technical School the whole of the scientific teaching of the Midland Institute was transferred to the former. The *Municipal Technical School* was established in 1893 in the building of the Midland Institute, and in 1895 was housed in a noble building of its own, in Suffolk Street, at a cost of £93,000. It contains metallurgical and engineering workshops and laboratories, lecture theatres for the teaching of chemistry and physics, a women's department, and rooms for the teaching of machine drawing and building construction. There are 2595 students in the evening classes and 195 boys in the day school. The books in the *Birmingham Library* increased from 40,000 in 1875 to about 65,000 in 1899. The old building, its home for 100 years, has been demolished and a new one erected. The free libraries of the city are supported by a rate of about 1½d. in the £. There is one central library, having 140,000 volumes in the reference and 30,000 in the lending departments respectively, and nine free libraries in other parts of the city, each with a lending department and a reading room. The net borough expenditure on this item amounted in 1898-99 to about £14,000.

Miscellaneous.—There are ten principal banks, five theatres, and six clubs; two morning and two evening papers, and four weekly papers. The great musical festival is still held triennially for the benefit of the General Hospital. Seven new parks or recreation grounds have been added since 1875, making the total twelve.

Public Buildings.—The noble block of buildings comprising the Council House and Art Gallery was commenced in 1874, the front portion completed in 1879, the rear in 1881. It completes the fine group of buildings, of which the Town Hall and Mason College are the other conspicuous members. The style is Renaissance, and the material is Darley Dale, Spinkwell,

and Wrexham stone. The entrance is surmounted with a pediment filled with groups of excellent sculpture. The erection of that part which forms the Art Gallery was the work of the Gas Committee, to whom the council granted the site on condition that they would build such a gallery over their own office, the council having no powers at the time to raise the required funds. The cost of the Council House, exclusive of the art gallery, was £163,805. The *Art Gallery* contains a fine collection of modern paintings, including masterpieces of David Cox, Millais, Hunt, Henry Moore, Albert Moore, Briton-Riviere, Burne-Jones. In the industrial hall are rich stores of Oriental metal work, Limoges enamel, English and foreign glass, Japanese ceramics. In the side galleries are various textiles, and Persian, Rhodian, Grès de Flandres, and other pottery. There is a remarkable collection of Wedgwood wares. Notable also is the collection of arms, which is probably the most complete in existence. The purchase of pictures has been made from time to time by means of an Art Gallery purchase fund of £12,000, privately contributed and placed under the control of the corporation. Many valuable works of art have been presented by individuals. Few additions have been made of late years to ecclesiastical architecture (a feature in which the city is not rich). Christ Church, noted for its ugliness and standing in front of the Council House, was pulled down in 1899. A remarkably rich set of stained-glass windows by Burne-Jones has been inserted in St Philip's Church. Among the Nonconformists the best specimen of architecture is the Church of the Old Meeting (Unitarian) in Bristol Road, opened in 1885. The Assize Courts in Corporation Street, known as the *Victoria Courts*, are among the most beautiful public buildings of the city. Begun in 1887, after Birmingham had been created an Assize district, they were completed in 1891 at a cost of £110,000. The beautiful entrance and the great hall (80 × 40), lighted by noble windows of stained glass, are notable. The style is Renaissance; the colour red on the exterior, buff on the interior. The central block of the façade is flanked by turrets and richly treated. Among other public buildings erected since 1875 are the splendid lecture theatre of the Midland Institute, the new Post Office, the inland revenue office, the County Court, the School Board offices, the Volunteer Drill Hall—additional tokens of the amazing public activity of Birmingham during the last quarter of the 19th century.

Manufactures.—Birmingham manufactures retain their character of multitudinous variety. Among changes since 1875 may be noted the rapid growth in the jewellery and the gun trades, and in the making of metal tubes of all kinds. The following figures issued by the Assay Office, showing the amount of gold and silver marked in successive years, will give some idea of the growth of the jewellery trade:—

		Gold.	Silver.
		ozs.	ozs.
1870	48,123	84,323
1880	81,606	239,835
1890	193,426	1,098,250
1895	239,472	1,796,056
1899	362,481	2,823,525

The year 1897 was famous for a sudden development of cycle manufacturing, followed in 1899 by an almost equally sudden collapse. But the variety of manufactures is such that a misfortune occurring to one is not likely to destroy the general prosperity of the city.

Social Life.—One of the most marked features of social life in Birmingham is the fact that contrasts in the distribution of wealth are less strongly marked than in most other great cities. The distance between the poorest and the richest is bridged over by a larger number of intermediate gradations. Colossal fortunes are few; on the other hand there is a numerous class of rich men. These, however, for the greater part are actually engaged in trade or manufactures, and hold their place in local life rather on account of industry pursued than of wealth possessed. The number of the leisured class, enjoying large incomes without participating in any local industry, is relatively small, but is said to be on the increase. There are many manufacturing companies, but great private firms are also numerous. In regard to labour conditions, the system of small masters, so rarely found at the present day, still holds its own in the manufactures of Birmingham, and shows no present signs of extinction. These facts give to the social relationships of the community a remarkable closeness, integrity, and permanence. (L. P. J.)

Birmingham, capital of Jefferson county, Alabama, U.S.A., situated in the central part of the state, in 33° 30' N. lat. and 86° 47' W. long., at an altitude of 600 feet. It is an important railway centre, being entered by five lines: the Central of Georgia, the Kansas City, Memphis and Birmingham, the Louisville

and Nashville, the Queen and Crescent, and the Southern. It is the most important point south of Pennsylvania for iron smelting and manufacturing. For this it has unequalled facilities, since in its immediate neighbourhood, at Red Mountain, are great deposits of iron ore, with limestone and coal for smelting. The city contains many blast furnaces, foundries, and other ironworks. Birmingham has had a very rapid growth owing to this development of the iron industry. In 1880 the population was only 3086, but in 1890 it had jumped to 26,178, and in 1900 to 38,415, of whom 1776 were foreign-born and 16,575 were negroes. The assessed valuation of real and personal property in 1900, on a basis of about 60 per cent. of the full value, was \$16,387,226, the tax rate \$22 per \$1000, and the net debt \$2,127,262.

Birsk, a district town of S.E. Russia, government of and 69 miles N.W. of Ufa, on Byelaya river. It is an important centre for trade with the Bashkirs. Population, 8603.

Biscay, a maritime province—one of the Basque Provinces—in the north of Spain, with 52 miles of coast, and an area of 849 square miles, divided into 5 administrative districts and 120 parishes. Its population was 235,659 in 1887, and 290,222 in 1897. The increase of population has been chiefly in Bilbao, Abando, Baracaldo, Portugalete, Santurce, and Sestao, owing to the growth of the mining and metallurgic industries. The birth-rate per 1000 was 38.5, the death-rate 30.9, and the marriage-rate 7.3. Only a few hundred emigrate annually. The climate is rather inclement and variable. The thermometer seldom drops below freezing-point, however, nor does snow fall frequently in winter except on the highest heights. The rainfall is on an average greater than in any province except those of the extreme north-west. The mountainous slopes of the province are studded with the traditional Basque "Caserio," or farmhouse, in which the hardy peasantry live on the *métayer* system, dividing the profits of the soil with absentee landlords. The soil is not very fertile except in some valleys and sheltered hillsides. Only 10,567 acres are devoted to the culture of wheat, 13,437 to maize, 6005 to pod fruit, 1742 to vines. There are, in all, 143,214 head of live stock, including 5259 horses, 825 mules, 2003 asses, 49,587 cattle, 61,642 sheep, 6848 goats, and 17,050 pigs. Except iron and zinc mining and calcination of ores, the industries of Biscay are declining, through peninsular and foreign competition, especially those connected with wool, petroleum, tanneries, and the export of fish, in particular "sardinas." The fishing fleet, however, still consists of several hundred boats, manned by nearly 5000 men and boys. Another very important industry is the manufacture of dynamite and other explosives at Galdacano, closely connected with the mining interests. There are also potteries, paper, soap, and shoe factories, flour mills and breweries, and the many springs and spas are frequented by people from all parts of Spain. The chief source of the province's prosperity lies in its mines; there were, in 1898, 2 sulphur, 12 zinc, 2 lead, and 204 iron ore productive mines, and 1037 unproductive. In some concessions the veins produce less and less every year. 11,105 persons were engaged in the iron ore mines, all but 76 in outside employment, and the total production of iron ore in 1898—5,073,338 tons—was 181,111 tons less than in 1897. The principal classes of ore are the limonite, or rubio, of all kinds of which from 4,000,000 to 4,250,000 tons, on an average, were extracted in 1896, 1897, and 1898; the red hæmatite or campanil, the output of which dwindled from 440,000 tons in 1896 to 275,800 tons in 1898, and will soon become nil; and the spathic or siderite, calcined

carbonate, of which 300,000 tons were extracted in 1896, 454,300 in 1897, and 477,700 in 1898. It is estimated that there are only from 40,000,000 to 50,000,000 tons of iron ore still to be mined, so that at the present rate of extraction the output would cease in about ten years. Nearly all the iron ores are sent abroad. Bilbao is the only port of any importance. The mining and industrial interests of Biscay have been very materially assisted by the quick and important development of means of communication of every kind. The provincial and parish roads, kept up by the local government, are excellent. No province in Spain had at the close of the 19th century such a complete network of railways, and they have all been built since 1870. (A. E. H.)

Bisceglie, a fortified seaport town and episcopal see of the province of Bari, Apulia, Italy, 21 miles by rail N.W. from Bari. In 1897 the port was cleared by 499 vessels of 151,568 tons. The population (1901) was 30,885.

Bischofswerda, a town of Germany, on the Wesenitz, which empties into the Elbe 12 miles W.S.W. of the town, and in the circle of Bautzen, kingdom of Saxony. It has a branch railway line to Zittau. There are a commercial and a technical school, cloth and artificial flower factories, glass-works, potteries, and in the neighbourhood large granite quarries. It is famous as the scene of a battle in 1813 between the French and the Allies on Napoleon's retreat from Moscow. It was the residence of Bishop Benno in the 11th century, and the "Bishop's Road" still runs from here to Meissen. Population (1890), 5612; (1900), 6610.

Bischweiler, a town of Germany, in the imperial territory of Alsace-Lorraine, district of Lower Alsace, 23 miles by rail N. by E. from Strasburg. It has manufactures of jute and machinery, brewing, and iron-founding. Hops are extensively grown. Population (1885), 6815; (1900), 7875.

Bishop Auckland, a market town and railway station in the Bishop Auckland parliamentary division of Durham, England, on the Wear and Gaunless, 11 miles S.S.W. of Durham city. Recent buildings are a temperance hall, church institute, memorial hall, fever hospital, accident hospital, and theatre (rebuilt). Area of urban district, 950 acres; population (1881), 10,097; (1901), 11,966.

Bishop Stortford, a market town and railway station in the Hertford parliamentary division of Hertfordshire, England, on the Stort, 14 miles E.N.E. of Hertford. The old church of St Michael's has been restored and a hospital opened. There are also grammar schools and other first-class educational establishments, including the Roman Catholic convent of St Mary. The church of St Joseph has also been established. There are important cattle and horse markets. Area of civil parish (an urban district), 3285 acres; population (1881), 6704; (1891), 6595; (1901), 7143.

Bishop Wearmouth. See SUNDERLAND.

Biskra, a town in Algeria, capital of a canton in the department of Constantine, 150 miles by rail S. by W. of Constantine. It is in communication with Philippeville by a railway which is to be extended as far as Tuggurt and Wargla. Since 1894-95 Biskra has grown into great repute as a winter residence, laying itself out rapidly in hotels, villas, and casinos. The climate is uncommonly healthy, the sky serene, and there is very seldom any rain. In spite of its proximity to the Sahara desert, the French enjoy excellent sanitary conditions. Only 700 in 1890, the French population in 1900 numbered 1500, and the

number of visitors every winter reaches an average of 20,000. The local population in 1880 was 6955; in 1891, 7165; in 1900, 8417.

Bismarck, capital of Burleigh county, North Dakota, U.S.A., and capital of the state. It is situated a little south of the centre of the state, on the east bank of the Missouri river, at an altitude of 1670 feet, and is on the main line of the Northern Pacific railway. The river is navigable at high water for 1200 miles above this point, and much freight is shipped from here by this route. The state Capitol, which cost \$500,000, is a fine building. Population (1880), 1758; (1900), 3319.

Bismarck, Otto Eduard Leopold von, PRINCE, DUKE OF LAUNBURG (1815-1898), the great German statesman, was born on 1st April 1815, at the Manor House of Schönhausen, his father's seat in the Mark of Brandenburg. The family has, since the 14th century, belonged to the landed gentry, and many members had held high office in the kingdom of Prussia. His father (d. 1845), of whom he always spoke with much affection, was a quiet, unassuming man, who retired from the army in early life with the rank of Rittmeister. His mother, a daughter of Mencken, cabinet secretary to the king, was a woman of strong character and ability, who had been brought up at Berlin under the "Aufklärung." Her ambition was centred in her sons, but Bismarck in his recollections of his childhood missed the influences of maternal tenderness. There were several children of the marriage, which took place in 1806, but all died in childhood except Bernhard (b. 1810, d. 1893), Otto, and one sister, Malvina (b. 1827), who married in 1845 Oscar von Arnim. Young Bismarck was educated in Berlin, first at a private school, then at the gymnasium of the Graue Kloster (Grey Friars). At the age of seventeen he went to the University of Göttingen, where he spent a little over a year; he joined the corps of the Hannoverana and took a leading part in the social life of the students. He completed his studies at Berlin, and in 1835 passed the examinations which admitted him to the public service. He was intended for the diplomatic service, but spent some months at Aix-la-Chapelle in administrative work, and then was transferred to Potsdam and the judicial side. He soon retired from the public service; he conceived a great distaste for it, and had shown himself defective in discipline and regularity. In 1839, after his mother's death, he undertook, with his brother, the management of the family estates in Pomerania; at this time most of the estate attached to Schönhausen had to be sold. In 1844, after the marriage of his sister, he went to live with his father at Schönhausen. He and his brother took an active part in local affairs, and in 1846 he was appointed *Deichhauptmann*, an office in which he was responsible for the care of the dykes by which the country, in the neighbourhood of the Elbe, was preserved from inundation. During these years he travelled in England, France, and Switzerland. The influence of his mother, and his own wide reading and critical character, made him at one time inclined to hold liberal opinions on government and religion, but he was strongly affected by the religious revival of the early years of the reign of Frederick William IV.; his opinions underwent a great change, and under the influence of the neighbouring country gentlemen he acquired those strong principles in favour of monarchical government as the expression of the Christian state of which he was to become the most celebrated exponent. His religious convictions were strengthened by his marriage to Johanna von Puttkamer, which took place in 1847.

In the same year he entered public life, being chosen as

substitute for the representative of the lower nobility of his district in the Estates-General, which were in that year summoned to Berlin. He took his seat with the Extreme Right, and distinguished himself by the vigour and originality with which he defended the rights of the king and the Christian monarchy against the Liberals. When the revolution broke out in the following year he offered to bring the peasants of Schönhausen to Berlin in order to defend the king against the revolutionary party, and in the last meeting of the Estates voted in a minority of two against the address thanking the king for granting a constitution. He did not sit in any of the assemblies summoned during the revolutionary year, but took a very active part in the formation of a union of the Conservative party, and was one of the founders of the *New Prussian Gazette*, better known as the *Kreuzzeitung*, which has since then been the organ of the Monarchical party in Prussia. In the new parliament which was elected at the beginning of 1849, he sat for Brandenburg, and was one of the most frequent and most incisive speakers of what was called the Junker party. He took a prominent part in the discussions on the new Prussian constitution, always defending the power of the king. His speeches of this period show great debating skill, combined with strong originality and imagination. His constant theme was, that the party disputes were a struggle for power between the forces of revolution, which derived their strength from the fighters on the barricades, and the Christian monarchy, and that between these opposed principles no compromise was possible. He took also a considerable part in the debates on the foreign policy of the Prussian Government; he defended the Government for not accepting the Frankfurt constitution, and opposed the policy of Radowitz, on the ground that the Prussian king would be subjected to the control of a non-Prussian parliament. The only thing, he said, that had come out of the revolutionary year unharmed, and had saved Prussia from dissolution and Germany from anarchy, was the Prussian army and the Prussian civil service; and in the debates on foreign policy he opposed the numerous plans for bringing about the union of Germany, by subjecting the Crown and Prussia to a common German parliament. He had a seat in the parliament of Erfurt, but only went there in order to oppose the constitution which the Parliament had framed. He foresaw that the policy of the Government would lead it into a position when it would have to fight against Austria on behalf of a constitution by which Prussia itself would be dissolved, and he was, therefore, one of the few prominent politicians who defended the complete change of front which followed the surrender of Olmütz.

It was probably his speeches on German policy which induced the king to appoint him Prussian representative at the restored Diet of Frankfurt in 1851. The appointment was a bold one, as he was entirely without diplomatic experience, but he justified the confidence placed in him. During the eight years he spent at Frankfurt he acquired an unrivalled knowledge of German politics. He was often used for important missions, as in 1852, when he was sent to Vienna. He was entrusted with the negotiations by which the duke of Augustenburg was persuaded to assent to the arrangements by which he resigned his claims to Schleswig and Holstein. The period he spent at Frankfurt, however, was of most importance because of the change it brought about in his own political opinions. When he went to Frankfurt he was still under the influence of the extreme Prussian Conservatives, men like the Gerlachs, who regarded the maintenance of the principle of the Christian monarchy against the revolution as the chief duty of the Prussian Government. He was

Parliamentary career.

Diplomatic career.

prepared on this ground for a close alliance with Austria. He found, however, a deliberate intention on the part of Austria to humble Prussia, and to degrade her from the position of an equal Power, and also great jealousy of Prussia among the smaller German princes, many of whom owed their thrones to the Prussian soldiers, who, as in Saxony and Baden, had crushed the insurgents. He therefore came to the conclusion that if Prussia was to regain the position she had lost she must be prepared for the opposition of Austria, and must strengthen herself by alliances with other Powers. The solidarity of Conservative interests appeared to him now a dangerous fiction. At the time of the Crimean war he advocated alliance with Russia, and it was to a great extent owing to his advice that Prussia did not join the western Powers. Afterwards he urged a good understanding with Napoleon, but his advice was met by the insuperable objection of the king to any alliance with a ruler of revolutionary origin.

The change of ministry which followed the establishment of a regency in 1857 made it desirable to appoint a new envoy at Frankfort, and in 1858 Bismarck was appointed ambassador at St Petersburg, where he remained for four years. During this period he acquired some knowledge of Russian and gained the warm regard of the Tsar, as well as of the Dowager-Empress, herself a Prussian princess. During the first two years he had little influence on the Prussian Government; the Liberal ministers distrusted his known opinions on parliamentary government, and the monarchical feeling of the prince regent was offended by Bismarck's avowed readiness for alliance with the Italians and his disregard of the rights of other princes. The failure of the ministry, and the estrangement between the king and the Liberal party, opened to him the way to power. Roon, who was appointed Minister of War in 1861, was an old friend of his, and through him Bismarck was thenceforward kept closely informed of the condition of affairs in Berlin. On several occasions the prospect of entering the ministry was open to him, but nothing came of it, apparently because he required a free hand in foreign affairs, and this the king was not prepared to give him. When an acute crisis arose out of the refusal of parliament, in 1862, to vote the money required for the reorganization of the army, which the king and Roon had carried through, he was summoned to Berlin; but the king was still unable to make up his mind to appoint him, although he felt that Bismarck was the only man who had the courage and capacity for conducting the struggle with parliament. He was, therefore, in June, made ambassador at Paris as a temporary expedient. There he had the opportunity for renewing the good understanding with Napoleon which had been begun in 1857. He also paid a short visit to England, but it does not appear that this had any political results. In September the parliament, by a large majority, threw out the budget, and the king, having nowhere else to turn for help, at Roon's advice summoned Bismarck to Berlin and appointed him minister-president and foreign minister.

Bismarck's duty as minister was to carry on the government against the wishes of the Lower House, so as to enable the king to complete and maintain the

Ministry.

reorganized army. The opposition of the House was supported by the country and by a large party at court, including the queen and crown prince. The indignation which his appointment caused was intense; he was known only by the reputation which in his early years he had won as a violent ultra-Conservative, and the apprehensions were increased by his first speech, in which he said that the problems of the time could only be settled by blood and iron. His early fall was predicted, and it was

feared that he might bring down the monarchy with him. Standing almost alone he succeeded in the task he had undertaken. For four years he ruled without a budget, taking advantage of an omission in the constitution which did not specify what was to happen in case the Crown and the two Houses could not agree on a budget. The conflict of the ministers and the House assumed at times the form of bitter personal hostility; in 1863 the ministers refused any longer to attend the sittings, and Bismarck challenged Virchow, one of his strongest opponents, to a duel, which, however, did not take place. In 1852 he had fought a duel with pistols against George von Vindre, a political opponent. In June 1863, as soon as parliament had risen, Bismarck published ordinances controlling the liberty of the press, which, though in accordance with the letter, seemed opposed to the intentions of the constitution, and it was on this occasion that the crown prince, hitherto a silent opponent, publicly dissociated himself from the policy of his father's ministers. Bismarck depended for his position solely on the confidence of the king, and the necessity for defending himself against the attempts to destroy this confidence added greatly to the suspiciousness of his nature. He was, however, really indispensable, for his resignation must be followed by a Liberal ministry, parliamentary control over the army, and probably the abdication of the king. Not only, therefore, was he secure in the continuance of the king's support, but he had also the complete control of foreign affairs. Thus he could afford to ignore the criticism of the House, and the king was obliged to acquiesce in the policy of a minister to whom he owed so much.

He soon gave to the policy of the monarchy a resolution which had long been wanting. When the emperor of Austria summoned a meeting of the German princes at Frankfort to discuss a reform of the confederation Bismarck insisted that the king of Prussia must not attend. He remained away, and his absence in itself made the congress unavailing. There can be no doubt that from the time he entered on office Bismarck was determined to bring to an issue the long struggle for supremacy in Germany between the house of Hapsburg and the house of Hohenzollern. Before he was able to complete his preparations for this, two unforeseen occurrences completely altered the European situation, and caused the conflict to be postponed for three years. The first was the outbreak of rebellion in Poland. Bismarck, an inheritor of the older Prussian traditions, and recollecting how much of the greatness of Prussia had been gained at the expense of the Poles, offered his help to the Tsar. By this he placed himself in opposition to the universal feeling of Western Europe; no act of his life added so much to the repulsion with which at this time he was regarded as an enemy of liberty and right. He won, however, the gratitude of the Tsar and the support of Russia, which in the next years was to be of vital service to him. Even more serious were the difficulties arising in Denmark. On the death of the king in 1863 Prince Frederic of Augustenburg came forward as claimant to the duchies of Schleswig-Holstein which had hitherto been joined to the crown of Denmark. He was strongly supported by the whole German nation and by many of its princes. Bismarck, however, once more was obliged to oppose the current of national feeling, which imperiously demanded that the German duchies should be rescued from a foreign yoke. Prussia was bound by the treaty of London, which guaranteed the integrity of the Danish monarchy; to have disregarded this would have been to bring about a coalition against Germany similar to that of 1851. Moreover, he held that it would be of no advantage to Prussia to create a new German state; if Denmark

Foreign policy.

OTTO VON BISMARCK.
(From the Painting by Franz von Lenbach.)

were to lose the duchies, he desired that Prussia should acquire them, and to recognize the Augustenburg claims would make this impossible. His resistance to the national desire made him appear a traitor to his country. To check the agitation he turned for help to Austria; and an alliance of the two joint Powers, so lately at variance, was formed. He then falsified all the predictions of the opposition by going to war with Denmark, not, as they had required, in support of Augustenburg, but on the ground that the king of Denmark had violated his promise not to oppress his German subjects. Austria continued to act with Prussia, and, after the defeat of the Danes, at the Peace of Vienna the sovereignty of the duchies was surrendered to the two allies—the first step towards annexation by Prussia. There is no part of Bismarck's diplomatic work which deserves such careful study as these events. Watched as he was by countless enemies at home and abroad, a single false step would have brought ruin and disgrace on himself; the growing national excitement would have burst through all restraint, and again, as fifteen years before, Germany divided and unorganized would have had to capitulate to the orders of foreign Powers.

The Peace of Vienna left him once more free to return to his older policy. For the next eighteen months he was occupied in preparing for war with Austria. **War with Austria.** For this war he was alone responsible; he undertook it deliberately as the only means of securing Prussian ascendancy in Germany. The actual cause of dispute was the disposition of the conquered duchies, for Austria now wished to put Augustenburg in as duke, a plan to which Bismarck would not assent. In 1865 a provisional arrangement was made by the treaty of Gastein, for Bismarck was not yet ready. He would not risk a war unless he was certain of success, and for this he required the alliance of Italy and French support; both he secured during the next year. In October 1865 he visited Napoleon at Biarritz and Paris. No formal treaty was made, but Napoleon promised to regard favourably an extension of Prussian power in Germany; while Bismarck led the emperor to believe that Prussia would help him in extending the frontier of France. A treaty of alliance with Italy was arranged in the spring of 1866; and Bismarck then with much difficulty overcame the reluctance of the king to embark in a war with his old ally. The results of the war entirely justified his calculations. Prussia, though opposed by all the German states except a few principalities in the north, completely defeated all her enemies, and at the end of a few weeks the whole of Germany lay at her feet.

The war of 1866 is more than that of 1870 the crisis of modern German history. It finally settled the controversy which had begun more than a hundred years before, and left Prussia the dominant power in Germany. **Settlement of 1866.** It determined that the unity of Germany should be brought about not by revolutionary means as in 1848, not as in 1849 had been attempted by voluntary agreement of the princes, not by Austria, but by the sword of Prussia. This was the great work of Bismarck's life; he had completed the programme foreshadowed in his early speeches, and finished the work of Frederick the Great. It is also the turning-point in Bismarck's own life. Having secured the dominance of the crown in Prussia and of Prussia in Germany, he could afford to make a reconciliation with the parties which had been his chief opponents, and turn to them for help in building up a new Germany. The settlement of 1866 was peculiarly his work. We must notice, first, how in arranging the terms of peace he opposed the king and the military party who wished to advance on Vienna and annex part of Austrian Silesia; with greater foresight he looked

to renewing the old friendship with Austria, and insisted (even with the threat of resignation) that no territory should be demanded. The southern states he treated with equal moderation, and thereby was able to arrange an offensive and defensive alliance with them. On the other hand, in order to secure the complete control of North Germany, which was his immediate object, he required that the whole of Hanover, Hesse Cassel, Hesse Nassau, and the city of Frankfort, as well as the Elbe duchies, should be absorbed in Prussia. He then formed a separate confederation of the North German states, but did not attempt to unite the whole of Germany, partly because of the internal difficulties which this would have produced, partly because it would have brought about a war with France. In the new confederation he became sole responsible minister, with the title *Bundes-Kanzler*; this position he held till 1890, in addition to his former post of premier minister. In 1871 the title was altered to *Reichs-Kanzler*.

The reconciliation with the Prussian parliament he effected by bringing in a bill of indemnity for the money which had been spent without leave of parliament. The Radicals still continued their opposition, but he thereby made possible the formation of a large party of moderate Liberals, who thenceforward supported him in his new Nationalist policy. He also, in the constitution for the new confederation, introduced a general Diet elected by universal suffrage. This was the chief demand of the revolutionists in 1848; it was one to which in his early life he had been strongly opposed. His experience at Frankfort had diminished his dislike of popular representation, and it was probably to the advice of Lassalle that his adoption of universal suffrage was due. He first publicly proposed it just before the war; by carrying it out, notwithstanding the apprehensions of many Liberal politicians, he placed the new constitution on a firmer base than would otherwise have been possible.

Up to 1866 he had always appeared to be an opponent of the National party in Germany, now he became their leader. His next task was to complete the work which was half-finished, and it was this which brought about the second of the great wars which he undertook.

The relations with Napoleon form one of the most interesting but obscurest episodes in Bismarck's career. We have seen that he did not share the common prejudice against co-operation with France. He found Napoleon willing to aid Prussia as he had aided Piedmont, and was ready to accept his assistance. There was this difference, that he asked only for neutrality, not armed assistance, and it is improbable that he ever intended to alienate any German territory; he showed himself, however, on more than one occasion ready to discuss plans for extending French territory on the side of Belgium and Switzerland. Napoleon, who had not anticipated the rapid success of Prussia, after the battle of Königgrätz at the request of Austria came forward as mediator, and there were a few days during which it was probable that Prussia would have to meet a French attempt to dictate terms of peace. Bismarck in this crisis by deferring to the emperor in appearance avoided the danger, but he knew that he had been deceived, and the cordial understanding was never renewed. Immediately after an armistice had been arranged, Benedetti, at the orders of the French Government, demanded as recompense a large tract of German territory on the left bank of the Rhine. This Bismarck peremptorily refused, declaring that he would rather have war. Benedetti then made another proposal, submitting a draft treaty by which France was to support Prussia in adding the South German states to the new confederation, and Germany was to support France in the annexation of Luxemburg and Belgium.

Bismarck discussed, but did not conclude the treaty; he kept, however, a copy of the draft in Benedetti's handwriting, and published it in the *Times* in the summer of 1870 so as to injure the credit of Napoleon in England. The failure of the scheme made a contest with France inevitable, at least unless the Germans were willing to forgo the purpose of completing the work of German unity, and during the next four years the two nations were each preparing for the struggle, and each watching to take the other at a disadvantage.

It is necessary, then, to keep in mind the general situation in considering Bismarck's conduct in the months immediately preceding the war of 1870. In 1867 there was a dispute regarding the right to garrison Luxemburg. Bismarck then produced the secret treaties with the southern states, an act which was, as it were, a challenge to France by the whole of Germany. During the next three years the Ultramontane party hoped to bring about an anti-Prussian revolution, and Napoleon was working for an alliance with Austria, where Beust, an old opponent of Bismarck's, was chancellor. Bismarck was doubtless well informed as to the progress of the negotiations, for he had established intimate relations with the Hungarians. The pressure at home for completing the work of German unity was so strong that he could with difficulty resist it, and in 1870 he was much embarrassed by a request from Baden to be admitted to the confederation, which he had to refuse. It is therefore not surprising that he eagerly welcomed the opportunity of gaining the goodwill of Spain, and supported by all the means in his power the offer made by Marshal Prim that Prince Leopold of Hohenzollern should be chosen king of that country. It was only by his urgent and repeated representations that the prince was persuaded against his will to accept. The negotiations were carried out with the greatest secrecy, but as soon as the acceptance was made known the French Government intervened and declared that the project was inadmissible. Bismarck was away at Varzin, but on his instructions the Prussian Foreign Office in answer to inquiries denied all knowledge or responsibility. This was necessary, because it would have caused a bad impression in Germany had he gone to war with France in support of the prince's candidature. The king, by receiving Benedetti at Ems, departed from the policy of reserve Bismarck himself adopted, and Bismarck (who had now gone to Berlin) found himself in a position of such difficulty that he contemplated resignation. The French, however, by changing and extending their demands enabled him to find a cause of war of such a nature that the whole of Germany would be united against French aggression. France asked for a letter of apology, and Benedetti personally requested from the king a promise that he would never allow the candidature to be resumed. Bismarck published the telegram in which this information and the refusal of the king were conveyed, but by omitting part of the telegram made it appear that the request and refusal had both been conveyed in a more abrupt form than had really been the case. But even apart from this, the publication of the French demand, which could not be complied with, must have brought about a war.

It was not till many years later that our knowledge of these events (which is still incomplete) was established; in 1894 the publication of the memoirs of the king of Rumania showed, what had hitherto been denied, that Bismarck had taken a leading part in urging the election of the prince of Hohenzollern. It was in 1892 that the language used by Bismarck himself made it necessary for the German Government to publish the original form of the Ems telegram.

In the campaign of 1870-71 Bismarck accompanied the headquarters of the army, as he had done in 1866. He was present at the battle of Gravelotte and at the surrender of

Sedan, and it was on the morning of 2nd September that he had his famous meeting with Napoleon after the surrender of the emperor. He accompanied the king to Paris, and spent many months at Versailles. Here he was occupied chiefly with the arrangements for admitting the southern states to the confederation, and the establishment of the empire. He also underwent much anxiety lest the efforts of Thiers to bring about an interference by the neutral powers might be successful. He had to carry on the negotiations with the French preliminary to the surrender of Paris, and to enforce upon them the German terms of peace.

For Bismarck's political career after 1870 we must refer to the article on GERMANY, for he was thenceforward entirely absorbed in the affairs of his country. *After 1870.* The foreign policy he controlled absolutely. As chancellor he was responsible for the whole internal policy of the empire, and his influence is to be seen in every department of state, especially, however, in the great change of policy after 1878. During the earlier period the estrangement from the Conservatives, which had begun in 1866, became very marked, and brought about a violent quarrel with many of his old friends, which culminated in the celebrated Arnim trial. He incurred much criticism during the struggle with the Roman Catholic Church, and in 1873 he was shot at and slightly wounded by a youth called Rullmann, who professed to be an adherent of the Clerical party. Once before, in 1866, just before the outbreak of war, his life had been attempted by a young man called Cohen, a native of Wurtemberg, who wished to save Germany from a fratricidal war. In 1872 he retired from the presidency of the Prussian ministry, but returned after a few months. On several occasions he offered to retire, but the emperor always refused his consent, on the last time with the word "Never." In 1877 he took a long leave of absence for ten months. His health at this time was very bad. In 1878 he presided over the Congress of Berlin. The following years were chiefly occupied, besides foreign affairs, which were always his first care, with important commercial reforms, and he held at this time also the office of Prussian Minister of Trade in addition to his other posts. During this period his relations with the Reichstag were often very unsatisfactory, and at no time did he resort so freely to prosecutions in the law-courts in order to injure his opponents, so that the expression *Bismarck-Beleidigung* was invented. He was engaged at this time in a great struggle with the Social-Democrats, whom he tried to crush by exceptional penal laws. The death of the Emperor William in 1889 made a serious difference in his position. He had been bound to him by a long term of loyal service, which had been rewarded with equal loyalty. For his relations to the Emperor Frederick and William II., and for the events connected with his dismissal from office in March 1890, we must refer to the articles under those names.

After his retirement he resided at Friedrichsruh, near Hamburg, a house on his Lauenburg estates. His criticisms of the Government, given sometimes in conversation, sometimes in the columns of the *Hamburger Nachrichten*, caused an open breach between him and the emperor; and Caprivi, in a circular despatch which was afterwards published, warned all German envoys that no real importance must be attached to what he said. When he visited Vienna for his son's wedding the German ambassador, Prince Reuss, was forbidden to take any notice of him. A reconciliation was effected in 1893. In 1895 his eightieth birthday was celebrated with great enthusiasm: the Reichstag alone, owing to the opposition of the Clericals and the Socialists, refused to vote an address. In 1891 he had been elected a member of the Reichstag,

but he never took his seat. He died at Friedrichsruh, 31st July 1898.

Bismarck was made a count in 1865; in 1871 he received the rank of Fürst (prince). On his retirement the emperor created him duke of Lauenburg, but he never used the title, which is not inherited by his son. In 1866 he received £60,000 as his share of the donation voted by the Reichstag for the victorious generals. With this he purchased the estate of Varzin in Pomerania, which henceforth he used as a country residence in preference to Schönhausen. In 1871 the emperor presented him with a large part of the domains of the duchy of Lauenburg. On his seventieth birthday a large sum of money (£270,000) was raised by public subscription, of which half was devoted to repurchasing the estate of Schönhausen for him, and the rest was used by him to establish a fund for the assistance of schoolmasters. As a young man he was an officer in the landwehr and militia, and in addition to his civil honours he was eventually raised to the rank of general. Among the numerous orders he received we may mention that he was the first Protestant on whom the Pope bestowed the order of Christ; this was done after the cessation of the Kulturkampf and the reference of the dispute with Spain concerning the Caroline Islands to the arbitration of the Pope.

Bismarck's wife died in 1894. He left one daughter and two sons. Herbert, the elder, was wounded at Mars-le-Tour, afterwards entered the Foreign office, acted as private secretary to his father, and then became secretary of state for Foreign affairs and Prussian minister. He conducted many of the negotiations with Great Britain on colonial affairs. He retired at the same time as his father. The second son, William, who was president of the province of Prussia, died in 1901.

AUTHORITIES.—The literature on Bismarck's life is very extensive, and it is only possible to enumerate a few of the most important books. The first place belongs to his own works. These include his own memoirs, published after his death, under the title *Gedanken und Erinnerungen*; there is an English translation, *Bismarck: his Reflections and Reminiscences*, Smith, Elder, and Co., 1898. They are incomplete, but contain very valuable discussions on particular points. The speeches are of the greatest importance both for his character and for political history; of the numerous editions that by HORST KOHL, in twelve volumes (Stuttgart, 1893-94), is the best; there is a cheap edition in Reclam's *Universal Bibliothek*. Bismarck was an admirable letter-writer, and numbers of his private letters have been published; a collected edition has been brought out by Horst Kohl. His letters to his wife were published by Prince Herbert Bismarck in 1900. A translation of a small selection of the private letters was published in 1876 by F. Maxse. Of great value for the years 1851-1858 is the correspondence with General L. v. Gerlach, which has been edited by Horst Kohl. A selection of the political letters, in four volumes, has been published under the title *Politische Briefe* (Berlin, 1889-93), but it is badly arranged. Of far greater importance are the collections of despatches and state papers edited by Herr v. Poschinger. These include four volumes entitled *Preussen im Bundestag*, 1851-59 (1882-84), which contain his despatches during the time he was at Frankfurt. Next in importance are two works, *Bismarck als Volkswirth* and *Aktenstücke zur Wirtschaftspolitik des Fürsten Bismarck*, which are part of the collection of state papers, *Aktenstücke zur Geschichte der Wirtschaftspolitik in Preussen*. They contain full information on Bismarck's commercial policy, including a number of important state papers. A useful general collection is that by LUDWIG HAHN, in five volumes, which includes a selection from letters, speeches, and newspaper articles. These collections have only been possible owing to the extreme generosity which Bismarck showed in permitting the publication of documents; he always professed to have no secrets. A full account of the diplomatic history from 1863 to 1866 is given by SYBEL in *Die Begründung des deutschen Reichs* (Munich, 1889-94), written with the help of the Prussian archives. The two last volumes, covering 1866-70, are of less value, as he was not able to use the archives for this period. Poschinger has also edited a series of works in which anecdotes, records of interviews and conversations are recorded; they are, however, of very unequal value. They are *Bismarck und die Parlamentarier*, *Fürst Bismarck und der Bundesrath*, *Die Ansprache des Fürsten Bismarck*, *Neue Tischgespräche*, and *Bismarck und die Diplomaten*. Selections from these have been published in English by CHARLES LOWE, *The Tabletalk of Prince Bismarck*, and by SIDNEY WHITMAN, *Conversations with Bismarck*. There is no satisfactory biography in German; the most ambitious is that by HANS BLUM, *Bismarck und seine Zeit* (Munich, 1894). By far the fullest guide to his life is by HORST KOHL, *Bismarck-Regesten* (Leipzig, 1891-92), which contains a record of Bismarck's actions on each day, with references to and extracts from his letters and speeches. HESKIEL'S *Das Buch des Grafen Bismarck* is pleasantly written, but is now quite out of date. There is a good translation by K. B. H. Mackenzie (London, 1870). For the

works of MORITZ BUSCH, which contain graphic pictures of his daily life, see the article BUSCH. There are several periodical publications devoted to the collection of documents bearing on Bismarck's life; of these much the most valuable is the *Bismarck-Jahrbuch*, edited by HORST KOHL. HERR v. POSCHINGER also brought out a *Bismarck Portfeuille*. There are English biographies by CHARLES LOWE, *Bismarck, a Political Biography* (2 vols. Lond.); revised edition in 1 vol. 1895; and by JAMES HEADLAM, (Putnam's, 1899).

(J. W. HE.)

Bismarck Archipelago. See NEW GUINEA and MELANESIA.

Bistritz (Hungarian, *Besztércze*), an ancient town (now corporate) of Eastern Hungary, 48 miles N.E. by E. of Kolosvár; capital of the county of Besztércze-Naszód, with 12,081 inhabitants. It is surrounded with the ruins of ancient bastions and towers; but in 1857 a great portion of the old town was burnt down. There are a Lutheran church, a gymnasium, religious houses of the Minorite and Piarist orders, an agricultural school, and hospitals. Its markets are much frequented, and an active trade is carried on with Rumania.

Bitlis, or BETLIS. (1) A vilâyet of Asiatic Turkey, on the Armenian plateau, situated to the W. and S.W. of Lake Van. It is a high-lying pastoral and agricultural country, with fertile, well-watered plains, rich pastures, and high rugged mountains, completely deforested. The climate is healthy, but the winter, which lasts six to seven months, is severe. There are many mineral springs, and much unworked mineral wealth. Carpets and cotton cloths are made, and gum, yellow-berries, furs, &c., are exported. Population, 400,000 (Moslems, 254,000; Christians, 142,000; Yezidis, 4000). (2) The capital of the vilâyet, Armenian *Paghesh*, altitude 4700 feet, picturesquely situated in the deep valley of the Bitlis Chai, on the principal road from the plateau to Mesopotamia. It has chalybeate and sulphur springs, which are much used, and is the seat of an American mission with schools for boys and girls. Bitlis has always been a turbulent city, peopled chiefly by Kurds and Armenians, and until 1836 it was ruled by a semi-independent Kurd Bey. On the 25th October 1895 there was a massacre of Armenians which commenced and ended by bugle-call. Population, 38,000 (Moslems, 20,500; Christians, 17,500).

Bitterfeld, a town of Prussia, province of Saxony, 26 miles N. from Leipzig by rail, on the river Mulde. It manufactures drain-pipes, paper-roofing, and machinery, and has saw-mills. Several coal-mines are in the vicinity. The town, which dates from at least the 12th century, was built by Dutch immigrants. Population (1885), 7596; (1895), 10,636; (1900), 11,839.

Biwa, a lake in the province of Omi, Japan. It measures 36 miles in length by 12 in breadth, has an area of 180 square miles, is about 330 feet above sea-level, and has an extreme depth of some 300 feet. There are only a few small islands in the lake, the principal of them being Chikubu-shima at the northern end.

Tradition alleges that Lake Biwa and the mountain of Fuji were produced simultaneously by an earthquake, in 286 B.C. On the west of the lake the mountains Hiei-zan and Hira-yama slope down almost to its margin, and on the east a wide plain extends towards the boundaries of the province of Mino. It is drained by a river flowing out of its southern end, and taking its course into the sea at Osaka. This river bears in succession the names of Seta-gawa, Uji-gawa, and Yodo-gawa. The lake abounds with fish, and the beauty of its scenery is remarkable. Small steam-boats ply constantly to the points of chief interest, and around its shores are to be viewed the *Omi-no-hakkei*, or "eight landscapes of Omi"; namely, the lake silvering under an autumn moon as one looks down from Ishi-yama; the snow at eye on Hira-yama; the glow of sunset at Seta; the groves and classic temple of Mii-dera as the evening bell sounds; boats sailing

home from Yabase; cloudless peaks at Awazu; rain at nightfall over Karasaki; and wild geese sweeping down to Katata. The lake is connected with Kyoto by a canal constructed in 1890, and is thus brought into water communication with Osaka.

Bixio, Nino (1821-1873), Italian soldier, was born on 2nd October 1821. While still a boy he was compelled by his parents to embrace a maritime career. After numerous adventures he returned to Italy in 1846, joined the Giovine Italia, and, on 4th November 1847, made himself conspicuous at Genoa by seizing the bridle of Charles Albert's horse and crying, "Pass the Ticino, Sire, and we are all with you." He fought through the campaign of 1848, became captain under Garibaldi at Rome in 1849, taking prisoners an entire French battalion, and gaining the gold medal for military valour. In 1859 he commanded a Garibaldian battalion, and gained the military cross of Savoy. Joining the Marsala expedition in 1860, he turned the day in favour of Garibaldi at Calatafimi, was wounded at Palermo, but recovered in time to besiege Reggio in Calabria (21st August 1860), and, though again wounded, took part in the battle of Voltorno, where his leg was broken. Elected deputy in 1861, he endeavoured to reconcile Cavour and Garibaldi. In 1866, at the head of the seventh division, he covered the Italian retreat from Custoza, refusing the Austrian invitation to surrender. Created senator in February 1870, he was in the following September given command of a division during the movement against Rome, took Cività Vecchia, and participated in the general attack upon Rome (20th September 1870). He died of cholera at Achin Bay in Sumatra *en route* for Batavia, whither he had gone in command of a commercial expedition (16th December 1873). (H. W. S.)

Bizet, Georges (properly ALEXANDRE CHARLES LÉOPOLD) (1838-1875), French musical composer, was born at Bougival, near Paris, on the 25th October 1838. He displayed musical ability at an early age, and was sent to the Paris Conservatoire, where he studied under Halévy and speedily distinguished himself, carrying off prizes for organ and fugue, and finally in 1857, after an ineffectual attempt in the previous year, the Grand Prix de Rome. A success of a different kind also befell him at this time. Offenbach, then manager of the Théâtre des Bouffes-Parisiens, had organized a competition for an operetta, in which young Bizet was awarded the first prize in conjunction with Charles Lecocq, the future composer of *La Fille de Mme. Angot*. After the three years spent in Rome, an obligation imposed by the French Government on the winners of the first prize at the Conservatoire, Bizet returned to Paris, where he achieved a reputation as a pianist and accompanist. On the 23rd of September 1863, his first opera, *Les Pêcheurs de Perles*, was brought out at the Théâtre Lyrique, but owing possibly to the somewhat uninteresting nature of the story, the opera did not enjoy a very long run. The qualities displayed by the composer, however, were amply recognized, although the music was stated, by some critics, to exhibit traces of Wagnerian influence. Wagnerism at that period was a sort of spectre that haunted the imagination of many leading members of the musical press. It sufficed for a work to be at all out of the common for the epithet "Wagnerian" to be applied to it. The term, it may be said, was intended to be condemnatory, and it was applied with little understanding as to its real meaning. The score of the *Pêcheurs de Perles* contains several charming numbers; its dreamy melodies are well adapted to fit a story laid in Eastern climes, and the music reveals a decided dramatic temperament. Bizet's second opera, *La Jolie Fille de Perth*, produced at the Théâtre Lyrique on 26th December 1867, was scarcely a step in

advance. Founded on Sir Walter Scott's novel, this opera lacks unity of style, and its pages are marred by concessions to the vocalist. One number has survived, the characteristic Bohemian dance which has been interpolated into the fourth act of *Carmen*. In his third opera Bizet returned to an Oriental subject. *Djamileh*, a one-act opera given at the Opéra Comique on 22nd May 1872, is certainly one of his most individual efforts. The music is impregnated with a fascinating Eastern flavour, and the entire work is a veritable artistic gem. Again were accusations of Wagnerism hurled at the composer's head, and *Djamileh* did not achieve the success it undoubtedly deserved. The composer was more fortunate with the incidental music he wrote to Alphonse Daudet's drama *L'Arlésienne*, produced in October 1872. Different numbers from this arranged in the form of suites have often been heard in the concert-room. Rarely have poetry and imagination been so well allied as in these exquisite pages, which seem to reflect the sunny skies of Provence. Bizet's masterpiece, *Carmen*, was brought out at the Opéra Comique on 3rd March 1875. Three months later the genial composer expired after a few hours' illness from a heart affection (3rd June). Before dying he had the satisfaction of knowing that *Carmen* had been accepted for production at Vienna. After the Austrian capital came Brussels, Berlin, and in 1878 London, when *Carmen* was brought out at Her Majesty's Theatre with immense success, Mme. Minnie Hauk impersonating the heroine. The influence exercised by Bizet on dramatic music has been very great, and may be discerned in the realistic works of the young Italian school, as well as in those of his own countrymen. *Carmen* may be said, in a measure, to constitute a fresh point of departure in French operatic music. Although conceived according to the ideas then in vogue at the Opéra Comique theatre, and in its original form containing spoken dialogue, it is essentially modern in spirit, new and bold in its harmonic and instrumental treatment. It clearly foreshadows the present evolution of the French "lyrical drama." (A. HE.)

Björneborg (Finnish, *Pori*), a district town of Finland, government of Åbo-Björneborg, on the E. coast of the Gulf of Bothnia, at the mouth of the Kumo. Lat. 51° 8' N., long. 46° 0' E. Population, 11,669 in 1897, mostly Swedes. Large vessels cannot enter its roadstead, and stop at Räfsö. The town has shipbuilding wharfs, one large saw-mill, mechanical works, and several tanneries and brickworks, the aggregate returns of which are about 2,000,000 marks. Its foreign trade is considerable, the chief exports being timber, and the main imports flour and metals.

Björnson, Bjørnstjerne (1832—), Norwegian poet, novelist, and dramatist, was born on the 8th December 1832, at the farmstead of Björge, in Kvikne, in Österdalen, a very remote district of Norway. In 1837 his father, who had been priest of Kvikne, was transferred to the parish of Nøssset, in Romsdalen; in this romantic place the childhood of Björnson was spent. In 1841 he was sent to school at the neighbouring town of Molde. At the age of 17 he was sent to Christiania to study for the University; his instinct for poetry was already awakened, and indeed he had written verses from his eleventh year. He took his degree at the University of Christiania in 1852, and began to work as a journalist, especially as a dramatic critic. His progress was, however, slow. It was not until 1856 that in *Thrand*, the earliest of his short stories, he began to develop his real talent. In 1857 appeared *Synnöve Solbakken*, the first of Björnson's peasant-novels; in 1858 this was followed by *Arne*, in 1860 by *A Happy Boy*, and in 1868 by *The Fisher Maiden*. These

are the most important specimens of his "bonde-fortællinger" or peasant-tales—a section of his literary work which has made a profound impression in his own country, and has made him popular throughout the world. These novels were full of freshness and beauty combined with remarkable realism. Two of these tales, *Arne* and *Synnöve Solbakken*, are nearly perfect, and offer perhaps finer examples of the pure peasant-story than are to be found elsewhere in literature. Björnson was anxious "to create a new saga in the light of the peasant," as he put it,

BJØRNSTJERNE BJØRNSEN.
(From a photograph by Otto, Paris.)

and he thought this should be done, not merely in prose fiction, but in national dramas or "folke-stykker." The earliest of these was *Between the Battles*, written in 1855, but not produced until 1857. It was followed by *Lame Hulda* in 1859, and *King Sverre* in 1861. All these efforts, however, were far excelled by the splendid trilogy of *Sigurd the Bastard*, which Björnson issued in 1862. This raised

him to the front rank among the younger poets of Europe. His *Sigurd the Crusader* should be added to the category of these heroic plays, although it was not printed until 1872. At the close of 1857 Björnson had been appointed director of the theatre at Bergen, a post which he held, with much journalistic work, for two years, when he returned to the capital. From 1860 to 1863 he travelled widely throughout Europe. Early in 1865 he undertook the management of the Christiania theatre, and brought out his popular comedy of *The Newly Married* and his romantic tragedy of *Mary Stuart in Scotland*. Although Björnson has introduced, into his novels and plays, songs of extraordinary beauty, he has never been a very copious writer of verse; both his principal contributions to this art were collected in the year 1870, when he published his *Poems and Songs* and the spirited romance called *Arnliot Gelline*; the latter volume contains the magnificent ode called "Bergliot," Björnson's finest contribution to lyrical poetry. It has been remarked that between 1864 and 1874, in the very prime of life, Björnson displayed a slackening of the intellectual forces very remarkable in a man of his energy; he was indeed during these years mainly occupied with politics and with his business as a theatrical manager. This was the period of Björnson's most fiery propaganda as a Radical agitator. In 1871 he began to supplement his journalistic work in this direction by delivering lectures over the length and breadth of the northern countries. He possesses to a surprising degree the arts of the orator, combined with a magnificent physical prestige. From 1873 to 1876 Björnson was absent from Norway, and in the peace of voluntary exile he recovered his imaginative powers. His new departure as a dramatic author began with *The Editor* in 1874 and *A Bankruptcy* in 1875, social dramas of an extremely modern and realistic cast, the second of which has continued to be, in many countries, the piece of Björnson's which has longest kept the stage. The poet was now settled at the estate of

Aulestad, in Gausdal; this house, a fine example of old Norwegian domestic architecture, has been his home since 1874 to the present day. In 1877 he published another novel, *Magnhild*,—an imperfect production, in which Björnson's ideas on social questions were seen to be in a state of fermentation,—and the polemical play called *The King*. Another story, *Captain Mansana*, an episode of the war of Italian independence, belongs to 1878. Extremely anxious to obtain a full success on the stage, Björnson concentrated his powers on the drama called *Leonarda*, which appeared in 1879. This was an appeal for religious toleration, and it raised a violent controversy. This was not allayed by a satirical play, *The New System*, which was brought out a few weeks later. Although these plays of Björnson's second period were greatly discussed, none of them (except *A Bankruptcy*) pleased on the boards. He was greatly disappointed and for some years again preserved silence as a dramatist. When once more he produced a social drama, *A Gauntlet*, in 1883, he was unable to persuade any manager to stage it at all. This was, nevertheless, one of the most skilfully composed "problem-plays" of modern times. In the autumn of the same year, Björnson published a mystical or symbolic drama (*Over Ævne, Beyond our Powers*), which was a new departure in his work and deals with the abnormal features of religious excitement with extraordinary power; this was not acted until 1899, when it achieved a great success. Björnson, convinced that the theatre was practically closed to him, turned back to the novel, and published in 1884 *Flags are Flying in Town and Port*, the first really long book he had written. In 1889 he printed another novel as lengthy, and still more remarkable, *In God's Way*, which is one of the works by which he is most widely known outside his native country. The same year saw the publication of a comedy, *Geography and Love*, which was acted, and continues to be played, with success. A number of short stories, of a more or less didactic character, dealing with startling points of emotional experience, were collected in 1894; among them those which produced the greatest sensation were *Dust*, *Mother's Hands*, and *Absalom's Hair*. Björnson's latest writings have been a political tragedy called *Paul Lange and Tora Parsberg*, a second part of *Beyond our Powers*, and a drama, *Laboremus*. In 1899, at the opening of the National Theatre, Björnson, whose popularity in Norway is unbounded, received an ovation, and his saga-drama of *Sigurd the Crusader* was put on the boards with great magnificence. A subject which interested him greatly, and on which he has occupied his indefatigable pen, is the question of the "bonde-maal," the adopting of a national language for Norway distinct from the "dansk-norsk" (Dano-Norwegian), in which her literature has hitherto been written. Björnson's strong and sometimes rather narrow patriotism has not blinded him to the fatal folly of such a proposal, and his lectures and pamphlets against the "maalstræv" in its extreme form have done more than anything else to save the language in this dangerous moment.

Black, William (1841-1898), British novelist, was born at Glasgow in 1841. His early ambition was to be a painter, but he made no way, and soon had recourse to journalism for a living. He was at first employed in newspaper offices in Glasgow, but obtained a post on the *Morning Star* in London, and at once proved himself a descriptive writer of exceptional vivacity. During the war between Prussia and Austria in 1866 he represented the *Morning Star* at the front, and was taken prisoner. This paper shortly afterwards failed, and Black joined the editorial staff of the *Daily News*. He also

edited the *Examiner*, at a time when that periodical was already moribund. After his first success in fiction, he gave up journalism, and devoted himself entirely to the production of novels. For nearly thirty years he was industriously successful in retaining the popular favour. He died at Brighton, 10th December 1898, without having experienced any of that reaction of the public taste which so often follows upon conspicuous successes in fiction. Black's first novel, *James Merle*, published in 1864, was a complete failure; his second, *Love and Marriage* (1868), attracted but very slight attention. But in 1871 *A Daughter of Heth* suddenly raised him to the height of popularity, and he followed up this success by a string of favourites. Among the best of his books are *The Strange Adventures of a Phaeton*, 1872; *A Princess of Thule*, 1873; *Madcap Violet*, 1876; *Macleod of Dare*, 1878; *White Wings*, 1880; *Sunrise*, 1880; *Shandon Bells*, 1883; *White Heather*, 1885; *Donald Ross of Heimra*, 1891; *Highland Cousins*, 1894; and *Wild Eelin*, 1898. Black was a thoroughgoing sportsman, particularly fond of fishing and yachting, and his best stories are those which are laid amid the breezy mountains of his native land, or upon the deck of a yacht at sea off its wild coast. His descriptions of such scenery are simple and picturesque. He was a word-painter rather than a student of human nature. His women are stronger than his men, and among them are many wayward and lovable creatures; but subtlety of intuition plays no part in his characterization. Black also contributed a life of Oliver Goldsmith to the *English Men of Letters* series. (A. W.A.)

Blackburn, a municipal (extended 1879), county (1888), and parliamentary borough of Lancashire, England, on the Brook, 24 miles N.N.W. of Manchester, 210 miles by rail N.N.W. of London. In 1877 the municipal and parliamentary boroughs became co-extensive, and in 1892 their area was constituted the township of Blackburn, and distributed into 14 wards, under a mayor, 14 aldermen, and 42 councillors. Besides the parish church, there are 70 churches and chapels. Of recent institution are a fish market (1874); municipal offices (1880); a chamber of commerce (1887); a free library (1873, extended 1893); additions to the infirmary in 1884, 1896, and 1897; a municipal technical school, opened in 1891 and extended in 1894, attended (1901) by 18,000 students; new and enlarged buildings for the grammar school (1884); a theatre rebuilt in 1886; and the Queen's Park (1887). The cotton industry employs thousands of operatives, the iron trade is also very considerable, and many are engaged in the making of machines; but the woollen manufacture has become practically extinct. There are two daily newspapers. Its area covers 6974 acres. Population (1881), 104,014; (1891), 120,064; (1901), 127,527.

Blackburn, Colin, BARON (1813-1896), British judge, was born in Selkirkshire in 1813, and educated at Eton and at Trinity College, Cambridge, where he took very high mathematical honours in 1835. He was called to the bar in 1838, and went the northern circuit. His progress was at first slow, and he employed himself in reporting and editing along with Mr Ellis eight volumes of the highly-esteemed *Ellis and Blackburn* reports. His deficiency in all the more brilliant qualities of the advocate almost confined his practice to commercial cases, in which he obtained considerable employment in his circuit; but he continued to belong to the outside bar, and was so little known to the legal world that his promotion to a puisne judgeship in the Court of Queen's Bench in 1859 was at first ascribed to Lord Campbell's partiality for his countrymen, but Lord Lyndhurst, Lord Wensley-

dale, and Lord Cranworth came forward to defend the appointment. Blackburn himself is said to have thought that a county court judgeship was about to be offered him, which he had resolved to decline. He soon proved himself one of the soundest lawyers on the bench, and when he was promoted to the Court of Appeal was considered the highest authority on common law. In 1876 he was made a Lord of Appeal and a life peer. Both in this capacity and as judge of the Queen's Bench he delivered many judgments of the highest importance, and no decisions have been received with greater respect. In 1886 he was appointed a member of the commission charged to prepare a digest of the criminal law, but retired on account of indisposition in the following year. He died on 8th January 1896. He was the author of a valuable work on the *Law of Sales*.

Black Hills, an isolated group of mountains in the western part of South Dakota and Eastern Wyoming, U.S.A., rising three to four thousand feet above their base, the highest peak, Harney, having an altitude above the sea of 7216 feet. The mass has an elliptical shape, its longer axis trending nearly north-west and south-east. The hills are structural in their origin, being formed by a short, broad, anticlinal fold, which is flat or nearly so on its summit. From this fold the stratified beds have in large part been removed, the more recent having been entirely eroded from the elevated mass. The edges of these are now found encircling the mountains, and forming a series of fairly continuous rims of hogbacks. The Carboniferous and older stratified beds still cover the west half of the hills, while from the eastern half they have been removed, exposing the granite. The hills were formerly within the range of the Sioux Indians, but rich gold placers were discovered, and in 1875 the Indians were removed. Subsequently low-grade quartz mines were found and developed, and at present furnish a notable part of the gold supply of the country.

Blackie, John Stuart (1809-1895), Scottish scholar and man of letters, was born in Glasgow, 28th July 1809. He was educated at the New Academy, and afterwards at the Marischal College, in Aberdeen, where his father had established himself as banking agent. After attending classes at Edinburgh University, Blackie spent two years at Aberdeen University as a student of theology; but the two succeeding years, which he spent abroad, extinguished his wish to enter the Church, and he somewhat unwillingly gave himself up, at his father's desire, to the study of law. By the time he was admitted a member of the Faculty of Advocates he had acquired a strong love of the classics and a taste for letters in general. A translation of *Faust*, which he published in 1834, met with considerable success. After a year or two of desultory literary work he was (in May 1839) appointed to the newly-instituted Latin chair in the Marischal College, Aberdeen. Difficulties arose in the way of his installation, owing to the action of the Presbytery on his refusing to sign unreservedly the Confession of Faith; but these were eventually overcome, and he took up his duties as professor in November 1841. In the following year he married. From the first his professorial lectures were conspicuous for the unconventional enthusiasm with which he endeavoured to revivify the study of the classics; and his growing reputation, added to the attention excited by a translation of *Æschylus* which he published in 1850, led to his appointment in 1852 to the professorship of Greek at Edinburgh University, a post which he continued to hold for thirty years. He was somewhat too erratic in his methods to be a great teacher, but his lectures were a triumph of personality. "Greek as a living language"

was a favourite theme of his, especially in his later years; and before his death he endowed a travelling scholarship to enable students to learn Greek at Athens. Scottish nationality was another source of enthusiasm with him; and in this connexion he displayed real sympathy with Highland home life and the grievances of the crofters. The foundation of the Celtic chair at Edinburgh University was mainly due to his efforts. In spite of the many calls upon his time he produced a considerable amount of literary work, usually on classical or Scottish subjects, including some poems and songs of no mean order. His life to its close was full of activity, and invariably gave the impression of being resolutely happy. He died in Edinburgh on 2nd March 1895. His published works include (besides several volumes of verse) *Horæ Hellenicæ* (1874), *The Language and Literature of the Scottish Highlands* (1876), *Lay Sermons* (1881), *Altavona* (1882), *Life of Burns* (1888), *Scottish Song* (1889), *Essays on Subjects of Moral and Social Interest* (1890), *Christianity and the Ideal of Humanity* (1893). (R. F. S.)

Blackmore, Richard Doddridge (1825-1900), English novelist, was born 9th June 1825 at Longworth, Berks, of which village his father was rector. He was educated at Blundell's School, Tiverton, and Exeter College, Oxford, where he obtained a scholarship. In 1847 he was placed in the second class in *Literæ Humaniores*, and took his degree. Two years later he entered as a student at the Middle Temple, and was called to the Bar in 1852. His first publication was a volume of *Poems by Melanther*, 1854, which showed no particular promise, nor did the succeeding volume *Epullia*, 1855, suggest that Blackmore had the makings of a poet. He was nevertheless enthusiastically sincere in his desire to follow literature as a profession; and when, a few years later, the complete breakdown of his health rendered it clear that he must remove from London, he determined to combine a literary life in the country with a business career as a market-gardener. He acquired land at Teddington, and set earnestly to work, the literary fruits of his new surroundings being a translation of the *Georgics* published in 1862. Verse, however, was clearly not his strong point, and when in 1864 he published his first novel, *Clara Vaughan*, several critics were prompt in recognizing its merit. *Cradock Nowell*, which followed it in 1865, was also praised; but neither story made much way with the general public. In 1869, however, he suddenly sprang into fame. *Lorna Doone*, which was published in that year, was a pioneer in the romantic revival; and appearing at a jaded hour, it was presently recognized as a work of singular charm, vigour, and imagination. Its success could scarcely be repeated, and though Blackmore wrote many other capital stories, of which the best known are, *The Maid of Sker* (1872), *Christowell* (1880), and *Perlycross* (1894), he will always be remembered almost exclusively as the author of *Lorna Doone*. He continued his quiet country life to the last, and died at Teddington, 20th January 1900, in his seventy-fifth year. *Lorna Doone* has faults of construction and exaggeration, but it is from every point of view a fine and picturesque romance. It has the true out-of-door atmosphere, is shot through and through with adventurous spirit, and in its dramatic moments shows both vigour and intensity. The heroine, though she is invested with qualities of faëry which are scarcely human, is an idyllic and haunting figure; and the bluff hero is, both in purpose and achievement, a veritable giant of romance. The story is almost a classic of the West country, and the many pilgrimages that are made annually to the Doone Valley (the actual characteristics of which differ materially from the descriptions given in the

novel) are entirely inspired by the buoyant imagination of Richard Blackmore. (A. W.A.)

Blackpool, a municipal borough (1876) and seaside resort in the Blackpool parliamentary division of Lancashire, England, 46 miles N. of Liverpool by rail. The town, which is quite modern, contains many churches and chapels of all denominations, a new town hall, public libraries, the Victoria hospital, three piers, theatres, ball-rooms, and other places of public amusement, including a tower 250 feet high and a "big wheel." New promenades, consisting of higher and lower walks, have recently been completed at a cost of upwards of £100,000, and the old promenade is in course of being widened and extended at an authorized cost of £350,000. When completed it will be 3 miles long. Area of borough, exclusive of foreshore, 3496 acres; including foreshore, 4244 acres. Population (1881), 14,229; (1891), 23,846; (1901), 47,346, or practically double. The return of inhabited houses shows a similar result, the number for 1891 being 4921, and for 1901, 9945.

Black Sea, The.—The conditions that prevail in the Black Sea are very different from those of the Mediterranean or any other sea. The existence of sulphuretted hydrogen in great quantities below 100 fathoms, the extensive chemical precipitation of calcium carbonate, the stagnant nature of its deep waters, and the absence of deep-sea life are conditions which make it impossible to discuss it along with the physical and biological conditions of the Mediterranean proper. In outline the Black Sea is kidney-shaped and lies almost entirely between the latitudes 41° and 45° N., extending to about 47° N. near Odessa. It is bounded on the N. by the southern coast of Russia; on the W. by Rumania, Turkey, and Bulgaria; on the S. and E. by Asia Minor. The northern boundary is broken at Kertch by a strait entering into the Sea of Azof, and at the junction of the western and southern boundary is the Bosphorus, which unites the Black Sea with the Mediterranean through the Sea of Marmora and the Dardanelles. The 100-fathom line is about 10 to 20 miles from the shore except in the north-west corner between Varna and Sebastopol, where it extends 140 miles seawards. The greatest depth is 1030 fathoms¹ near the centre, there being only one basin. The steepest incline outside 100 fathoms is to the south-east of the Crimea and at Amastra; the incline to the greater depths is also steep off the Caucasus and between Trebizond and Batum.

The depths of the Black Sea are lifeless, higher organic life not being known to exist below 100 fathoms. Fossiliferous remains of *Dreissena*, *Cardium*, and other molluscs have, however, been dredged up, which help to show that conditions formerly existed in the Black Sea similar to those that exist at the present day in the Caspian Sea. According to Andrusof, when the union of the Black Sea with the Mediterranean through the Bosphorus took place, salt water rushed into it along the bottom of the Bosphorus and killed the fauna of the less saline waters. This gave rise to a production of sulphuretted hydrogen which is found in the deposits, as well as in the deeper waters.

Observations in temperature and salinity have only been taken during summer. During summer the surface salinity of the Black Sea is from 1·70 to 2·00 per cent. down to 50 fathoms, whereas in the greater depths it attains a salinity of 2·25 per cent. The temperature is rather remarkable, there being an intermediate cold layer between 25 and 50 fathoms. This is due to the sinking of the cold surface water (which in winter reaches freezing-point) on to the top of the denser more saline water of the greater depths. There is thus a minimum circulation in the greater depths causing there uniformity of temperature, an absence of the circulation of oxygen by other means than diffusion, and a protection of the sulphuretted hydrogen from the oxidation which takes place in homologous situations in the open ocean. The temperature down to 25 fathoms is from 78·3° to 46·2° F., and in the cold layer,

¹ 1227 Russian fathoms.

between 25 and 50 fathoms, is from 46°2' to 43°5' F., rising again in greater depths to 48°2' F.

The *Sea of Marmora* may be looked upon as an arm of the *Ægean* Sea and thus part of the Mediterranean proper. Its salinity is comparable to that of the eastern basin of the Mediterranean, which is greater than that of the Black Sea, viz. 4 per cent. Similar currents exist in the Bosphorus to those of the Strait of Gibraltar. Water of less salinity flows outwards from the Black Sea as an upper current, and water of greater salinity from the Sea of Marmora flows into the Black Sea as an under-current. This under-current flows towards Cape Tarhangut, where it divides into a left and right branch. The left branch is appreciably noticed near Odessa and the north-west corner; the right branch sweeps past the Crimea, strikes the Caucasian shore (where it comes to the surface running across, but not into, the south-east corner of the Black Sea), and finally disperses flowing westwards along the northern coast of Asia Minor between Cape Jason and Sinope. This current causes a warmer climate where it strikes. So marked is this current that it has to be taken into account in the navigation of the Black Sea.

The *Sea of Azof* is exceedingly shallow, being only about 6 fathoms in its deepest part, and it is largely influenced by the river Don. Its water is considerably fresher than the Black Sea, varying from 1.55 to 0.68 per cent. It freezes more readily and is not affected by the Mediterranean current.

Little is known of the fauna and flora of the Black Sea, although plankton, nekton, and benthos exist down to 100 fathoms. It appears to be related to that of the Mediterranean. The debris of these animals and plants, falling to the greater depths, helps to keep up the supply of sulphuretted hydrogen, probably with the aid of anaerobic bacteria. The deposits contain remains of pelagic and shore diatoms, foraminifera, and other protozoa, sponge spicules, fish bones, &c. The formation of sulphuretted hydrogen in the depths is accompanied by two processes; a continual sinking of fine deposit of calcium carbonate and the formation of ferrous sulphide, which depends on the accumulation of deposits capable of changing it to pyrites. Probably also free sulphur will be found to exist in the deposits. Laminated ooze has been taken; when dried it appears in white and yellow layers, the white being mostly calcium carbonate. The lamination of the ooze may be due to the seasonal fluctuations of deposits brought down by great rivers, such as the Danube, which brings down 228 times as much sediment in full as in low water. Part of the sulphuretted hydrogen forms ferrous sulphide at the bottom, which occurs in all deposits, especially in gray ooze, and fills the cells of coecinodiscus and the pipe-like shells of rhizosolenia, and the inside of diatoms. The conditions both in the Dardanelles and the Bosphorus were examined very carefully in the year 1872 by Captain (afterwards Admiral Sir) William Wharton of H.M.S. *Shearwater*, and his results were published in an interesting report to the Admiralty of that date.

It is remarkable that the comparatively fresh water of the Black Sea persists without sensible mixture through the Sea of Marmora and into the Dardanelles. The depth in the two channels is only from 30 to 50 fathoms, and the dimensions of the strait are too small to make the phenomenon of any importance for the supply of the Mediterranean. Were the exit of the Black Sea a channel with sufficient fall to bring the surface of the Sea of Marmora below the level of the highest part of its bottom, so that no return current could take place, the waters of the Black Sea would be fresh.

(J. Y. B.)

Blackstone, a town of Worcester county, Massachusetts, U.S.A., situated in the southern part of the state, has an area of 17 square miles, bordering on the Connecticut line. The principal village bears the same name, and is on the Blackstone river, and the New York, New Haven, and Hartford railway. It is at an altitude of 200 feet, and is regularly laid out. Population of the town (1880), 4907; (1900), 5721.

Blaenavon, a town, urban district, railway station, and parish in the northern parliamentary division of Monmouthshire, England, on the river Avon Lwyd or Torvaen. There are very extensive iron, steel, and coal works, with blast furnaces and rolling mills in the district. Population of urban district (area, 4105 acres) (1901), 10,869.

Blagodatsk, a mountain of Russia, government of Perm, on the eastern slope of the Ural Mountains, 13 miles from the main range, and near to Kushvinsk ironworks. Altitude about 1270 feet. It contains the largest deposits of magnetic iron hitherto known in the world, and, with the Vysokaya, Magnitnaya and Kachkanar mountains of

the Urals, belongs to the same type as the "Iron Mountain" in Missouri and Taberg in Sweden. Its western slope consists of various augitic rocks, while on its top and southern slope large deposits of magnetic iron (occasionally crystalline) are found. The ore is extracted to the amount of from 400,000 to 540,000 metric quintals, and is worked at the Goro-Blagodatsk ironworks.

Blagovyeschensk, a town of East Siberia, chief town of the Amur province, on the left bank of the Amur, near its confluence with the Zeya, 50° 15' N., 127° 38' E.; altitude about 500 feet. The Chinese village Sakhalin is opposite it, and the town of Aihun is 20 miles below on the left bank of the Amur. Founded in 1858, the town has progressed since, and had in 1897, 32,606 inhabitants. There are several steam flour-mills and one ironworks. It is now a centre for tea exported to Russia, and cattle brought from Transbaikalia and Mongolia, *via* Merghen, for the Amur, as well as for all sorts of provisions, &c., shipped to the lower Amur. It has gymnasia for boys and girls, a seminary, and 7 other schools, and is the seat of the bishop of Amur and Kamchatka.

Blaine, James Gillespie (1830-1893), American statesman, was born in West Brownsville, Pa., 31st January 1830, of sturdy Scottish-Irish stock on his father's side. With many early evidences of literary capacity and political aptitude, he graduated at Washington College, Pennsylvania, in 1847, and spent a few years in teaching. Settling in Augusta, Maine, in 1854, he became editor of the *Kennebec Journal*, and subsequently of the *Portland Advertiser*. But his editorial work was speedily abandoned for a more active public career. He was elected to the Legislature in 1858, serving four years, the last two as Speaker. At the same time he became chairman of the Republican State Committee, and for twenty years personally directed every campaign of his party. In 1862 he was elected to Congress, continuing in the House fourteen years, followed by four years in the Senate. He was chosen Speaker in 1869 and served three terms. The House was the fit arena for his political and parliamentary ability. He was a ready and powerful debater, full of resource, and dexterous in controversy. The tempestuous politics of the war and reconstruction period suited his aggressive nature and constructive talent. The measures for the rehabilitation of the States that had engaged in rebellion occupied the chief attention of Congress for several years, and Mr Blaine bore a leading part in framing and discussing them. The primary question related to the basis of representation upon which they should be restored to their full rank in the political system. A powerful section contended that the basis should be the body of legal voters, on the ground that the South could not then secure an increment of political power on account of the emancipated blacks unless they were admitted to political rights. Mr Blaine, on the other hand, contended that representation should be based on population instead of voters, as being fairer to the North, where the ratio of voters varied widely, and he insisted that it should be safeguarded by security for impartial suffrage. This view prevailed, and the fourteenth amendment to the constitution was substantially Mr Blaine's proposition. In the same spirit he opposed a scheme of military governments for the Southern States, unless associated with a plan by which, upon the acceptance of prescribed conditions, they could release themselves from military rule and resume civil government. He was the first in Congress to oppose the claim, which gained momentary and widespread favour in 1867, that the public debt, pledged in coin, should be paid in greenbacks. The protection of naturalized citizens who, on return to

their native land, were subject to prosecution on charges of disloyalty, enlisted his active interest and support, and the agitation in which he was conspicuous led to the treaty of 1870 between the United States and Great Britain, which placed adopted and native citizens on the same footing.

As the presidential election of 1876 approached, Mr Blaine was clearly the popular favourite of his party. In the Republican National Convention he missed by only twenty-eight votes nomination for President, being finally beaten by a combination of all the other candidates. Thereupon, through a vacancy, he entered the Senate, where his activity was unabated. Currency legislation was specially prominent. Blaine, who had previously opposed greenback inflation, now resisted depreciated silver coinage. He was the earnest champion of the advancement of American shipping, and advocating liberal subsidies, insisted that the policy of protection should be applied on the sea as well as on land. The National Convention of 1880, divided between the two nearly equal forces of Blaine and Grant, struggled through thirty-six ballots, when the friends of Blaine succeeded in nominating General Garfield. In the new Administration Blaine became Secretary of State, but, through the assassination of the President, held the office only a few months. His brief service was distinguished by several notable steps. In order to promote the friendly understanding and co-operation of the nations on the American continent he projected a Pan-American Congress, which, after being arranged for, was frustrated by his retirement. He also sought to secure a modification of the Clayton-Bulwer treaty, and in an extended correspondence with the British Government strongly asserted the policy of an exclusive American control of any isthmian canal.

With undiminished hold on the imagination and devotion of his followers he was nominated for President in 1884. After a heated canvass, in which he made a series of brilliant speeches, he was beaten by a narrow margin in New York. Refusing to be a candidate in 1888, he became Secretary of State under President Harrison, and resumed his work which had been interrupted nearly eight years before. The Pan-American Congress, then projected, now met in Washington, and Blaine, as its master spirit, presided over and guided its deliberations through its session of five months. Its most important conclusions were for reciprocity in trade, a continental railway, and compulsory arbitration in international complications. Shaping the tariff legislation for this policy, Blaine negotiated a large number of reciprocity treaties which augmented the commerce of his country. He upheld American rights in Samoa, pursued vigorous diplomacy with Italy over the New Orleans lynchings, held a firm attitude through the Chilean complications and the Barrundia affair, and carried on with Great Britain a resolute controversy over the seal fisheries of Bering Sea,—a difference afterwards settled by arbitration. He resigned on the eve of the National Convention of 1892, wherein his name was ineffectually used, and died at Washington, D.C., on 27th January 1893. During his later years of leisure he wrote *Twenty Years in Congress*, a brilliant historical work in two volumes. Of singularly alert faculties, with remarkable knowledge of the men and history of his country, and an extraordinary memory, his masterful talent for politics and statecraft, together with his captivating manner and engaging personality, gave him, for nearly two decades, an unrivalled hold upon the fealty and affection of his party.

(C. E. S.)

Blair, Francis Preston (1821-1875), American soldier and politician, was born in Lexington, Kentucky,

and died in St Louis, Missouri, 8th July 1875. He was educated at Princeton College, and, in 1843, began the practice of law in St Louis. In succession he served in the Mexican war, was a Democratic editor, and a member of the Missouri legislature. He was elected as a Republican to the national House of Representatives in 1856, 1860, 1862. Vigorous measures on his part were instrumental in preventing Missouri from joining the Confederacy. He became colonel of volunteers in 1861, rose to the rank of major-general, and performed important military services. He strenuously opposed the congressional plan of reconstruction, and in 1868 was the Democratic candidate for the vice-presidency. To fill an unexpired term, he was United States Senator from Missouri, 1871-73.

Blairgowrie, a police burgh of Perthshire, Scotland, finely situated on the Erich, at the terminus of a branch of the Caledonian railway, 20 miles N.E. of Perth. The town is entirely modern, and owes its progress to the water-power supplied by the Erich for linen and jute factories. There are also sawmills and a large factory for bee appliances. Strawberries, raspberries, and other fruit are largely grown in the neighbourhood. Among the public buildings are the town hall and the mechanics' institute. A public park was presented to the town in 1892. Population (1881), 4537; (1891), 3714; (1901), 3377.

Blanc, Jean Joseph Charles Louis, generally known as LOUIS BLANC (1811-1882), French politician and historian, was born on 29th October 1811 at Madrid, where his father held the post of inspector-general of finance under Joseph Bonaparte. Failing to receive aid from Pozzo di Borgo, his mother's uncle, Louis Blanc studied law in Paris and became a contributor to various journals. In 1839 appeared his *L'Organisation du travail*. The principles laid down in this famous essay form the key to Louis Blanc's whole political career. He attributes all the evils that afflict society to the pressure of competition, whereby the weaker are driven to the wall. He demanded the equalization of wages, and the merging of personal interests in the common good—"à chacun selon ses besoins, de chacun selon ses facultés." This was to be effected by the establishment of "social workshops," a sort of combined co-operative society and trade-union, where the workmen in each trade were to unite their efforts for their common benefit. On the outbreak of the Revolution of 1848 Louis Blanc became Minister of Labour, and presided over the "Commission du gouvernement pour les travailleurs," which served only to air a great variety of theories. He was generally held responsible for the establishment of national workshops, which were really due to the Minister of Public Works, Marie, and were, on the confession both of Lamartine and of the director of the workshops, Émile Thomas, intended to counteract Blanc's influence. Nevertheless, the failure of this attempt to provide for thousands of idle or incompetent workmen, for whom no real work could be found, undermined Blanc's position; and after the abortive Socialist movement of 15th May, the triumph of the Moderates obliged him, after suffering personal violence, to flee, first to Belgium, and thence to London. Ten years later he published (in English) a defence of his share in the Revolution under the title of *1848: Historical Revelations*. As far back as 1839 Louis Blanc had vehemently opposed the idea of a Napoleonic restoration, predicting that it would be "despotism without glory," "the Empire without the Emperor." He therefore remained in exile till the fall of the Second Empire in 1870. In the following February he was elected a

member of the National Assembly, and protested passionately against the peace-proposals. Though a member of the extreme Left, he was too clear-minded to sympathize with the Commune, but exerted his influence in vain on the side of moderation. In 1878 he advocated the abolition of the Presidency and the Senate, with unlimited right of association and freedom of the press. His last important act was to obtain an amnesty for the Communists. He died at Cannes on 6th December 1882, and on 12th December received a public funeral in Père-Lachaise. As a historian Louis Blanc obtained most success with his *Histoire de dix ans, 1830-1840* (1841-44). During his stay in England he utilized the collection of French revolutionary tracts at the British Museum, as the basis of the greater part of his *Histoire de la Révolution Française* (1847-62). He possessed a picturesque and vivid style, and considerable power of research; but the fervour with which he expressed his convictions, while placing him in the first rank of orators, too often degraded his historical writings into political pamphlets. His most important works, besides those already mentioned, are *Lettres sur l'Angleterre* (1866-67), *Dix années de l'histoire de l'Angleterre* (1879-81), and *Questions d'aujourd'hui et de demain* (1873-84). (H. S.)

Blanc, Le, chief town of arrondissement, department of Indre, France, 27 miles W.S.W. of Chateauroux, on the railway from Paris to Agen, and on the Creuse, which divides it into two parts, an upper and a lower town. It has manufactures of cloth, agricultural implements, and tools, wool- and hemp-spinning and tanning, and trade in horses. The town (anciently *Fines*, later *Oblincum*, and in the 15th century *Naillac*, from the baronial family who then held possession of it) was a frontier fortress of the province of Berry. It is well built, and has the remains of three ancient castles and the church of St. Genitour, parts of which date from the 12th century. Population (1881), 4614; (1896), 4971, comm., 6253.

Blandford, or BLANDFORD FORUM, a municipal borough, market town, and railway station, in the Northern parliamentary division of Dorsetshire, England, on the Stour, 16 miles N.E. of Dorchester. The town is an ancient one, and has a town hall, cottage hospital, a grammar school (founded 1521 at Milton Abbas, transferred to Blandford 1775), and Blue Coat school (1729). There are other educational charities. Antiquarian remains are found in the district, and the Chalk abounds in fossils. Lord Portman has recently built a fine new mansion on the high ground in place of the old "Bryanston" near the river. Area, 145 acres; population (1881), 3753; (1901), 3649.

Blankenberghe, a seaport town of Belgium, in the province of West Flanders, on the North Sea, 9½ miles N.N.W. of Bruges, with which it is connected by rail. A canal from this town unites, a little to the west of Bruges, with the Bruges-Ostend canal. The popularity of the place as a bathing resort is growing, and it now receives about 30,000 visitors annually. A dyke, forming a handsome promenade, a mile long, has been constructed along the dunes, and there are a casino, large hotels, and villas. Population (comm.) (1890), 4116.

Blankenburg, a town and health resort of Germany, duchy of Brunswick, at the N. foot of the Harz Mountains, 12 miles by rail S.W. from Halberstadt. It has been in large part rebuilt since a fire in 1836, and possesses a castle, with various collections, a museum of antiquities, an old town hall, and churches. There are pine-needle baths and a hospital for nervous diseases. Gardening is a speciality. Population (1885), 6010; (1895), 9289; (1901), 10,173.

Blanqui, Louis Auguste (1805-1881), French publicist, was born on 8th February 1805 at Puget-Théniers, where his father, Jean Dominique Blanqui, was at that time sub-prefect. He studied both law and medicine, but found his real vocation in politics, and at once constituted himself a champion of the most advanced opinions. He took an active part in the Revolution of July 1830, and continuing to maintain the doctrine of republicanism during the reign of Louis Philippe, was condemned to repeated terms of imprisonment. Implicated in the armed outbreak of the *Société des Saisons*, of which he was a leading spirit, he was in the following year, 1840, condemned to death, a sentence that was afterwards commuted to imprisonment for life. He was released by the Revolution of 1848, only to resume his attacks on existing institutions. The Revolution, he declared, was a mere change of name. The violence of the *Société républicaine centrale*, which was founded by Blanqui to demand a modification of the government, brought him into conflict with the more moderate Republicans, and in 1849 he was condemned to ten years' imprisonment. In 1865, while serving a further term of imprisonment under the Empire, he contrived to escape, and henceforth continued his propaganda against the Government from abroad, until the general amnesty of 1869 enabled him to return to France. Blanqui's leaning towards violent measures was illustrated in 1870 by two unsuccessful armed demonstrations: one at the funeral of Victor Noir on 12th January; the other on 14th August, when he led an attempt to seize some guns at a barrack. Upon the fall of the Empire, through the Revolution of 4th September, Blanqui established the club and journal *La patrie en danger*. He was one of the band that for a moment seized the reins of power on 31st October, and for his share in that outbreak he was again condemned to death on 10th March of the following year. A few days afterwards the insurrection which established the Commune broke out, and Blanqui was elected a member of the insurgent government, but his detention in prison prevented him from taking an active part. Nevertheless he was in 1872 condemned along with the other members of the Commune to transportation; but on account of his broken health this sentence was commuted to one of imprisonment. In 1879 he was elected a deputy for Bordeaux; although the election was pronounced invalid, Blanqui was set at liberty, and at once resumed his work of agitation. At the end of 1880, after a speech at a revolutionary meeting in Paris, he was struck down by apoplexy, and expired on 1st January 1881. Blanqui's uncompromising communism, and his determination to enforce it by violence, necessarily brought him into conflict with every French Government, and half his life was spent in prison. Besides his innumerable contributions to journalism, he published an astronomical work entitled *L'Éternité par les astres* (1872), and after his death his writings on economic and social questions were collected under the title of *Critique sociale* (1885). (H. S.)

Blantyre, a parish in Lanarkshire, Scotland, S.E. of Glasgow, containing High Blantyre, Low Blantyre, Stonefield, and several villages, besides stations. High Blantyre had a population of 7836 in 1891. Low Blantyre (1505) has a weaving factory, successor to one in which David Livingstone, born in Blantyre Works village, worked as a boy. Stonefield (5581) has a purely mining population. Coal and limestone are worked in the parish. The population of Blantyre parish in 1901 was 14,151.

Blantyre (Africa). See BRITISH CENTRAL AFRICA.

Blasting. See MINING.

Blavatsky, Helena Paulovna (1831-1891), Russian theosophist, was born at Ekaterinoslav, Russia, 31st July (O.S.) 1831. She is stated to have been the daughter of Peter Hahn, a Russian officer. An unruly girl, she sought emancipation from family ties by marrying in her 17th year (7th July 1848) Nicephore Blavatsky, a Russian official in Caucasia, from whom she was separated after a few months of stormy conjugal life. In later days, when seeking to invest herself with a halo of virginity, she described the marriage as a nominal one, and her bridegroom as "a plumeless raven nearer seventy than sixty." If this statement were true, M. Blavatsky, who was reported as still living in 1895, would then have been considerably over 110 years of age. During the twenty years that followed the separation from her husband, Mme. Blavatsky travelled and probably gained experience as a spiritualistic medium in large cities, among which it is believed that she visited Paris, Cairo, New Orleans, Tokio, and Calcutta. The period 1848-58 was alluded to subsequently as the veiled period of her life, and she spoke vaguely of a seven years' sojourn in "Little and Great Tibet" or preferably of a "Himalayan retreat." In 1858 she revisited Russia, where she created a considerable sensation as a spiritualistic medium. Early in the 'seventies she acquired prominence among the spiritualists of the United States, and was mixed up in the Eddy Brothers and Katie King frauds. Her leisure was occupied with the study of occult and cabalistic literature, to which was soon to be added that of the sacred writings of India, though these had to be approached through the medium of translations. In 1875 she conceived the plan of combining the spiritualistic "control" with the Buddhistic legends about Tibetan sages or wonder-working adepts. Henceforth she determined to exclude all control save that of two Tibetan adepts or "mahatmas," called respectively Koot Hoomi and Morya. The mahatmas exhibited their "astral bodies" to her, "precipitated" messages which reached her from the confines of Tibet in an instant of time, supplied her with sound doctrine, and incited her to perform tricks for the conversion of sceptics. At New York, in October 1875, with the aid of Colonel Olcott, she definitely launched the "Theosophical Society," which was formed out of a group of disillusioned spiritualists, and had for its avowed objects to put down spiritualism, to convert the materialists, and to prove the existence of the Tibetan brothers. The Brahmanic and Buddhistic literatures supplied the society with a technical vocabulary, and its doctrines were a curious amalgam of Egyptian, cabalistic, occultist, Indian, and modern spiritualistic ideas and formulas. The two leading text-books, *Isis Unveiled* (1877), and *The Secret Doctrine* (1888), both compiled by Madame Blavatsky, are a mosaic of unacknowledged quotations from well-known works, as Mackenzie's *Masonic Cyclopædia*, King's *Gnostics*, Zeller's *Plato*, the works on magic by Dunlop, Salverte, Ennemoser, and Des Mousseaux, but above all from the mystical writings of Eliphas Levi. She took great pains with *A Glossary of Theosophical Terms* (1890-92), compiled for the benefit of the "flap-doodles," as in moments of candour she called her disciples. But the appearance of Home's *Lights and Shadows of Spiritualism* (1877) had a prejudicial effect upon the propaganda, and Heliona P. Blavatsky (as she began to style herself) sought temporary obscurity in India. Thence she contributed some clever papers, "From the Caves and Jungles of Hindostan," to the *Russky Vvestnik*. Defeated in her object of obtaining employment in the Russian secret service, she resumed her efforts to gain converts to theosophy. For this purpose the exhibition of "physical phenomena" was found necessary. The jugglery which she practised was cleverly

conceived, but carelessly executed, and on three distinct occasions the elaborate system of trickery to which she resorted was exposed in the most conclusive manner. Nevertheless, Madame Blavatsky's extraordinary cleverness, volubility, energy, and will power enabled her to maintain her ground, and when she died on 8th May 1891 (White Lotus Day), at the Theosophical headquarters in Avenue Road, Regent's Park, London, she was the acknowledged head of a community numbering not far short of 100,000, with journals in London, Paris, New York, and Madras. Much information respecting her will be found in Solovyoff's *Modern Priestess of Isis*, translated by Walter Leaf (1895), in Arthur Lillie's *Madame Blavatsky and her Theosophy* (1895), and in the report made to the Society for Psychical Research by the Cambridge graduate despatched to investigate her doings in India. In personal appearance the "old one," as Madame was familiarly called by her following, has been described as globular in shape, with a dull gray complexion, a far from attractive physiognomy, and eyes like discoloured turquoises. Yet she certainly fascinated those who came in contact with her, even those of her colleagues whom her "fibs" and indiscretions kept in a continual state of uneasiness. (T. SÆ.)

Blavet, a river of France in the departments of Côtes du Nord and Morbihan. It rises in the W. of the former department, at an altitude of 1000 feet, some 3 miles S.W. of Bourbriac. Flowing generally S. by E. to Goarec, it forms, about midway in its course to that place, the "perte of the Blavet," the "Toul-Goulic" of the Bretons. This is a deep defile, whose bed is a chaotic mass of gigantic rocks, amongst which the stream first dashes wildly and then disappears underneath for a distance of 300 to 400 yards. Its first important affluent, the Sulon, joins it a little above Goarec on the left, and at this town the Nantes and Brest Canal, carried along the valley of its affluent the Doré, in whose basin are several reservoirs, joins it on the right. From Goarec to Pontivy the Blavet is incorporated with the canal, but at the latter town the canal leaves it, and the Blavet, itself canalized, flows S. by W. and then S.W. for 37 miles to Hennebont, where maritime navigation begins. Here it widens into an estuary, and at its outfall, 9 miles lower, opposite Port Louis, has a width of over a mile. At Lorient, 2 miles above Port Louis, it is joined on the right bank by its chief tributary the Scorff, forming the port of Lorient. The Scorff rises in the Côtes du Nord, on the borders of Morbihan, flows generally S., and at Pont Scorff, 6 miles N.N.W. of Lorient, becomes navigable. Its total length is about 47 miles. The Blavet has a length of about 87 miles, and a drainage basin of 646,000 acres. The traffic on the Blavet between Pontivy and Hennebont employed in 1899, 3233 boats, carrying 148,706 tons of merchandise, chiefly combustible minerals, metallurgical products, building materials, wood, and manure.

Blaydon, a town in the Chester-le-Street parliamentary division of Durham, England, on the Tyne, 5 miles W. of Gateshead by rail. There are parish churches and Methodist chapels. The chief industries are coal-mining, iron-founding, pipe, fire-brick, chemical manure, and bottle manufactures. Area of urban district, 9339 acres; population (1881), 10,687; (1901), 19,617.

Bleiberg ("Lead Mountain"), a commune composed of five villages at the foot of the Dobratsch, 9 miles W. of Villach, in Carinthia, Austria, one of the richest lead-mining centres in Europe. The ores comprise silver-free galena, sulphate of zinc, and calamine. In 1891 the total yield was 33,922 metric centals of lead ore, and 25,536 m.c. of zinc ore. In addition to the mining and smelting works

there are factories for the production of wire cable. Population (1900), 3435.

Blida, a town of Algeria, 32 miles by rail S.W. of the city of Algiers, capital of a canton in the department of Algiers, situated at the foot of the first slopes of the Atlas mountains. It carries on an important flour trade, but its principal commerce is in oranges, surrounded as it is with orangeries numbering from 50,000 to 60,000 trees. Its population, 15,255 in 1872, increased to 23,685 in 1890, and in 1900 numbered 27,772, of whom 6991 were French.

Blind, Mathilde (1841-1896), author, was born at Mannheim on 21st March 1841. Her father was a banker named Cohen, but she took the name of Blind in consequence of her mother's marriage to Karl Blind, one of the leaders of the Baden insurrection in 1848-49. The family was compelled to take refuge in England, and in course of time Mathilde Blind devoted herself to literature and to endeavours for the elevation of her sex. As a writer of verse she produced some remarkable work, such as "The Prophecy of St Oran," "The Heather on Fire," "The Ascent of Man," and other minor poems. She wrote biographies of George Eliot and Madame Roland, and translated Strauss's *The Old Faith and the New*, and the *Memoirs of Marie Bashkirtseff*. She died in 1896, bequeathing her property to Newnham College, Cambridge. Her collected poetical works have been republished.

Bloemfontein, a town of British South Africa, capital of the Orange River Colony, and formerly of the Orange Free State. It was founded by the early Boer trekkers about 1836 on a southern affluent of the Vaal, on the open veldt amid a few low detached kopjes at an altitude of 4518 feet above the sea, about 120 miles from the Cape frontier, 750 from Cape Town, and 450 from Port Elizabeth. Of its normal population of 10,000 (1901), fully 7000 are whites (Dutch and English), and 3000 blacks (Basutos and Bechuanas, commonly called "Kaffirs"). The town is regularly laid out with streets running at right angles and flanked by several fine buildings, mostly of stone quarried in the vicinity. Amongst them are the government offices and the former Raadzaal (Parliament House), now used for general municipal purposes. It is well supplied with electric light and good water, and is a great railway centre with lines converging from Cape Town, Port Elizabeth, and Pretoria. Owing to its dry, salubrious climate it has become a sort of South African sanatorium, recommended especially for pulmonary affections. During the Boer war Bloemfontein was occupied without resistance by Lord Roberts, soon after the surrender of Kronje at Paardeberg (27th-28th February 1900).

Bloomfield, a township of Essex county, New Jersey, U.S.A., situated in the north-eastern part of the state, on the Erie and the Delaware, Lackawanna and Western railways, at an altitude of 130 feet; founded toward the close of the 17th century, under the name of Watesson. Population (1880), 5748; (1900), 9668.

Bloomington, capital of McLean county, Illinois, U.S.A., situated in 40° 30' N. lat. and 89° 00' W. long., in the central part of the state, at an altitude of 785 feet. It is a railway centre, being on the Chicago and Alton, the Cleveland, Chicago, Cincinnati and St. Louis, the Illinois Central, and the Lake Erie and Western railways. It is the seat of Illinois Wesleyan University, with a faculty numbering 34, and with 300 students, one-third of whom are women. Population (1880), 17,180; (1900), 23,286.

Bloomington, a city of Indiana, U.S.A., capital of Munroe county, S.W. of the centre of the state, on the Chicago, Indiana, and Louisville railway. It is

the seat of the state university, which in 1900 had a faculty numbering 77, and students numbering 1137. Population (1890), 4018; (1900), 6460.

Bloomsburg, a chartered town of Pennsylvania, U.S.A., capital of Columbia county, on the north branch of the Susquehanna river, and on the Delaware, Lackawanna, and Western, and the Philadelphia and Reading railways. Its industries are connected chiefly with iron manufacture. Population (1890), 4635; (1900), 6170.

Blue Island, a village of Cook county, Illinois, U.S.A., in the north-eastern part of the state, adjoining Chicago, of which it is a suburb. Population (1890), 3329; (1900), 6114.

Bluff Harbour. See INVERCARGILL.

Blumenthal, Leonhard von (1810-1900), Prussian field-marshal, son of Captain Louis von Blumenthal (d. 1813), was born at Schwedt, on the Oder, on 30th July 1810. Educated at the military schools of Culm and Berlin, he entered the Guards landwehr regiment as 2nd lieutenant in 1827. After serving in the Rhine provinces he joined the topographical division of the general staff in 1846. As lieutenant of the 31st foot he took part, in 1848, in the suppression of the Berlin riots, and in 1849 was promoted captain on the General Staff. The same year he served on the staff of General von Bonin in the Schleswig-Holstein campaign, and so distinguished himself, particularly at Fredericia, that he was appointed chief of the staff of the Schleswig-Holstein army. In 1850 he was general staff officer of the mobile division under von Tietzen in Hesse Cassel. He was sent on a mission to England in that year (4th class of Red Eagle) and on several subsequent occasions. He became a major in 1853, was appointed personal adjutant to Prince Frederick Charles in 1859, and promoted in 1860 to be colonel of the 31st regiment, and later of the 71st regiment. He was chief of the staff of the 3rd army corps when, on the outbreak of the Danish war of 1864, he was nominated chief of the general staff of the army against Denmark, and displayed so much ability, particularly at Missunde, Düppel, and the passage to Alsen island, that he was promoted to be major-general and given the Order of Merit. In the Austrian war of 1866 Blumenthal was chief of the General Staff of the second army under the Prussian crown prince, and led it with a swiftness of decision and directness of aim which enabled it to strike home on the heights of Culm, and to decide the fortunes of the day at Königgrätz (lieut.-general, the oak-leaf of the Order of Merit, and knight commander of Hohenzollern). In the years of peace which followed he commanded the 14th army division at Düsseldorf, and his conduct of the manoeuvres arranged with the 13th division under General von Groeben earned the highest praise from military critics. In the Franco-German war of 1870-71, as chief of the staff of the third army, Blumenthal's knowledge and skill were invaluable. His co-operation with Moltke was masterly. Before orders had been given for the decisive flank march which ended at Sedan, he had grasped the position of Bazaine at Metz and had made all his preparations. No general order was ever given for the battle of Sedan, but Moltke knew that the third and fourth armies would close the iron ring in the nick of time. In 1871 Blumenthal represented Germany at the Chobham manoeuvres, and was given the command of the 4th army corps at Magdeburg. He was made a field-marshal in 1888, and died at Quillendorf, 21st December 1900. He married in 1852 Delicia Anna von Vyner (*née* Calthorpe), and left two sons and three daughters. Field-Marshal Blumenthal had the

reputation of being one of the first strategists of the time. If in 1866 it was Moltke's mind that calculated the issue of the campaign, it was Blumenthal's vigour which defeated all obstacles before the goal. Like Moltke he was a man of sterling simplicity of character. Short and thick-set in figure, with large head and kindly features, his appearance was rather that of a professor than of a soldier; but his eyes were full of fire and energy. He was affectionately known for many years as "der alte Blumenthal."

Bluntschli, Johann Kaspar (1808-1881), Swiss jurist, was born at Zurich, 7th March 1808. Having studied law at Berlin and Rome, he was appointed professor of jurisprudence in the newly-founded University of Zürich in 1833. In the troubles which agitated the state he mainly sided with the Conservative party, which he led in the Great Council from 1837, and after the revolution of September 1839 he became a member of the Government. An important modification in his ideas was effected by his becoming acquainted with the philosophy of that remarkable, but little-known man, Frederick Rohmer, of whom he said, shortly before his death, "I have gained renown as a jurist, but my greatest desert is to have comprehended Rohmer." This more liberal direction of mind made Bluntschli's participation in the Government uneasy to him, and he resigned; but so high was the estimation of his eminence as a jurist that the task of compiling a civil code was unanimously entrusted to him. After the counter-revolution and overthrow of the Sonderbund (1847), Bluntschli removed to Munich, where he was professor both of private and of state law from 1848 to 1861. He produced there the *Allgemeines Staatsrecht*, and the *Lehre vom modernen Staat*, which gave him a European reputation, as well as numerous minor works, and conducted a legal review from 1855 to 1858. His removal to Heidelberg in 1861 was mainly occasioned by the unpopularity of his advocacy of German unity in opposition to the "particularism" then prevailing at Munich. "I felt," he says, "that I was merely tolerated." In his new state, Baden, he soon had to encounter active antagonism from his endeavours to keep it neutral during the Austro-Prussian war of 1866; the course of events, however, speedily decided the question in Bluntschli's favour, and, though frequently annoyed by intestine troubles in the University, upon which his memoirs throw a curious light, he held his position unchallenged until his sudden death, at Carlsruhe, on 21st October 1881. While at Heidelberg he produced several books which have taken rank as classics of jurisprudence, especially *Geschichte des allgemeinen Staatsrechts* (1864); *Das moderne Kriegerrecht* (1866); *Das moderne Völkerrecht* (1868); *Das Beuterecht im Krieg* (1878). The *Staatsrecht* has been translated into Japanese. The most remarkable external incidents of his life during this period were his active participation in the *Protestantenverein*, a society formed to combat reactionary and Ultramontane ideas in theology; and his important contribution towards the settlement of the *Alabama* difficulty by a seasonable pamphlet. His highly interesting autobiography was published in 1884. His library was acquired by the Johns Hopkins University at Baltimore. (R. G.)

Bobbili, a town of British India, in the Vizagapatam district of Madras, situated in 18° 34' N. lat. and 83° 25' E. long., 70 miles N. of Vizagapatam town. Population (1891), 14,468. It is the residence of a raja of old family, whose estate covers an area of 227 square miles; estimated income, £40,000; permanent land revenue, £9000. The present raja is a highly-educated man who has visited England. He is a K.C.I.E. and member of the Madras

legislative council. He maintains a high school (270 pupils in 1896-97), and also a printing-press.

Bober, a river of Germany, rising at an altitude of 2438 feet in the Riesengebirge, S.W. of Landeshut. It threads the valley of Hirschberg, reaches the lowlands at Löwenberg, flows past Bunzlau and Sagan, and enters the Oder from the left at Krossen (118 feet altitude), after a N.N.W. course of 158 miles. In summer it is often a mere shallow stream, but after the melting of the snows becomes a devastating torrent.

Bobrinets, a town of South Russia, in the government and 120 miles N.N.W. of Kherson, near the railway from Nikolaiev to Kieff. It has tobacco factories and several steam flour-mills. Population, 14,352.

Bobruisk, a first-class fortress and district town of Russia, government and 108 miles by rail S.E. of Minsk, on the right bank of the Berezina river, and on the railway from Libau and Wilno to Ekaterinoslav. It has important ironworks and steam flour-mills, and carries on an important trade in corn and timber shipped to Libau. Population (1897), 35,177 (58,256 with military).

Bochnia, the chief town of a district of the same name in the Austrian crown-land of Galicia. Population of district (1890), 100,653, mostly Polish and Catholic; (1900), 105,375. Population of town (1890), 8849, of whom 2133 were Jews; (1900), 10,049. In addition to the salt-mines (with an annual yield of about 15,000 tons) and deposits of gypsum, there are a number of steam-mills and factories for the manufacture of tin wares; while a considerable trade is done in corn, salt, and eggs.

Bocholt, a town of Prussia, province of Westphalia, 12 miles by rail N. from Wesel, and near the frontier of Holland. It is a seat of the cotton industry. Population (1885), 10,567; (1895), 16,273; (1900), 21,241.

Bochum, a town of Prussia, province of Westphalia, 11 miles by rail W. from Dortmund. It is a centre of the iron and steel industries, producing principally cast steel, cast iron, iron pipes, wire and wire ropes, and lamps, with tin and zinc works, coal-mining, factories for carpets, calcium carbide, and paper-roofing, brickworks, and breweries. There are a mining and a metallurgical school. Population (1885), 40,767; (1895), 53,842; (1900), 65,554.

Bockenheim. See FRANKFORT-ON-MAIN.

Böcklin, Arnold (1827-1901), Swiss painter, was born at Bâle, 16th October 1827. His father, Christian Frederick Böcklin, born at Bâle, 16th July 1802, was descended from an old family of Schaffhausen, and engaged in the silk trade. His mother, Ursula Lippe, was a native of the same city. In 1846 he began his studies at the Düsseldorf Academy under Schirmer, who recognized in him a student of exceptional promise, and sent him to Antwerp and Brussels, where he copied the works of Flemish and Dutch masters. Böcklin then went to Paris, worked at the Louvre, and painted several landscapes; his "Landscape and Ruin" reveals at the same time a strong feeling for nature and a dramatic conception of scenery. After serving his time in the army he set out for Rome in March 1850, and the sight of the Eternal City was a fresh stimulus to his mind. So, too, was the influence of Italian nature and that of the dead pagan world. At Rome he married. (20th June 1853) Angela Rosa Lorenza Pascucci. In 1856 he returned to Munich, and remained there four years. He then exhibited the "Great Park," one of his earliest works, in which he treated ancient mythology with the stamp of individuality, which was the basis of his reputation. Of this period, too, are his "Nymph and Satyr," "Heroic-

Landscape" (Diana Hunting), both of 1858, and "Sappho," 1859. These works, which were much discussed, together with Lenbach's recommendation, gained him his appointment as professor at the Weimar Academy. He held the office for two years, painting the "Venus and Love," a "Portrait of Lenbach," and a "Saint Catherine." He was again at Rome from 1862 to 1866, and there gave his fancy and his taste for violent colour free play in his "Portrait of Mme. Böcklin," now in the Bâle Gallery, in "An Anchorite in the Wilderness," 1863; a "Roman Tavern," and "Villa on the Sea-shore," 1864; this last, one of his best pictures. He returned to Bâle in 1866 to finish his frescoes in the gallery, and to paint, besides several portraits, "The Magdalene with Christ," 1868; "Anacreon's Muse," 1869; and "A Castle and Warriors," 1871. His "Portrait of Himself," with Death playing a violin, 1873, was painted after his return again to Munich, where he exhibited his famous "Battle of the Centaurs" (in the Bâle gallery); "Landscape with Moorish Horsemen" (in the Lucerne gallery); and "A Farm," 1875. From 1876 to 1885 Böcklin was working at Florence, and painted a "Pieta," "Ulysses and Calypso," "Prometheus," and the "Sacred Grove." From 1886 to 1892 he settled at Zürich. Of this period are the "Naiads at Play," "A Sea Idyll," and "War." After 1892 Böcklin resided at San Domenico, near Florence. An exhibition of his collected works was opened at Bâle from 20th September to 24th October 1897. He died on the 16th of January 1901. His life has been written by Henri Mendelssohn.

Bodenbach (Czech, *Podmokly*), a town in the government-district of Tetschen in Bohemia, Austria, near the Saxon frontier, situated on the left bank of the Elbe, opposite Tetschen, with which town it is connected by a chain bridge and two railway bridges. There is an Austrian and a Saxon custom-house; and the town has an important transit trade in addition to considerable manufactures (cotton and woollen goods, earthenware and crockery, chemicals, chicory, chocolate, sweetmeats and preserves, and beer). Population (1890), 7574, almost exclusively German; (1900), 10,782.

Bodenstedt, Friedrich Martin von (1819-1892), German author, was born at Peine, in the kingdom of Hanover, 22nd April 1819. Although a prolific and meritorious writer, Bodenstedt is more than most authors, as regards his European celebrity, "the man of one book." His career, as it proved, was determined by his engagement in 1841 as tutor in the family of Prince Galitzin at Moscow, where he gained a thorough acquaintance with Russian. This led to his appointment in 1844 as the head of a public educational establishment at Tiflis, Transcaucasia. Thus residing in close proximity to Persia, he became acquainted with a modern Persian poet, Mirza Schaffy, and this intercourse inspired him with the volume of little poems in the Oriental taste published after his return to Europe (1851) as a translation from the *Divan* of his friend, but really original. The success of this work can only be compared with that of FitzGerald's *Omar Khayyám*, produced in somewhat similar circumstances, but differed from it in being immediate. The *Divan* has gone through innumerable editions in Germany, and has been translated into almost all literary languages. Nor is this celebrity undeserved, for although Bodenstedt does not attain the poetical elevation of FitzGerald, his view of life is wider, more cheerful, and more sane, while the

execution is a model of grace and elegance. The rich stores of knowledge which Bodenstedt brought back from the East were turned to account in two important books, *The Peoples of the Caucasus and their Struggles against the Russians* (1848) and *A Thousand and One Days in the East* (1850). For some time after his return Bodenstedt continued to work up Slavonic subjects, producing translations of Pushkin, Lermontoff, Turgenieff, and of the poets of the Ukraines, and writing a tragedy on the false Demetrius, and an epic, *Ada, the Lesghian Maid*, on a Circassian theme. Finding, probably, this vein exhausted, he exchanged, in 1858, the Slavonic professorship he had obtained at Munich for one of Early English literature, and published (1858-60) a valuable work on the English dramatists contemporary with Shakespeare, with copious translations. In 1862 he produced a standard translation of Shakespeare's sonnets, and between 1866 and 1872 published a complete version of the plays, with the help of many coadjutors. In 1867 he undertook the direction of the Meiningen Dramatic Company of Actors, and was ennobled by the duke. After 1873 he lived successively at Altona, Berlin, and Wiesbaden, where he died on the 19th of April 1892. His later works consist of an autobiography (1888), successful translations from Hafiz and Omar Khayyám, and lyrics and dramas which added little to his reputation. (R. G.)

Bodmin, a market town, municipal borough, and county town in the Bodmin parliamentary division (since 1885) of Cornwall, England, 30 miles by rail W. by N. of Plymouth. The ancient church of St Petrock has been restored and the county lunatic asylum extended, public rooms and a public library have been erected. Bodmin also contains H.M. civil and naval prisons, the headquarters of the county constabulary, the depot of the Duke of Cornwall's Light Infantry, and the District Probate Registry. Area, 2797 acres; population (1881), 5061; (1901), 5353.

Boehm, Sir Joseph Edgar, BART. (1834-1890), British sculptor, was born of Hungarian parentage on 4th July 1834 at Vienna, where his father was director of the Imperial Mint. After studying the plastic art in Italy and at Paris, he worked for a few years as a medallist in his native city. After a further period of study in England, he was so successful as an exhibitor at the Exhibition of 1862, that he determined to abandon the execution of coins and medals, and to give his mind to portrait busts and statuettes, chiefly equestrian. The colossal statue of Queen Victoria, executed in marble (1869) for Windsor Castle, and the monument of the duke of Kent in St George's Chapel, were his earliest great works, and so entirely to the taste of his royal patrons, that he rose rapidly in favour with the court. He was made A.R.A. in 1878, and produced soon afterwards the fine statue of Carlyle on the Thames Embankment at Chelsea. In 1881 he was appointed sculptor in ordinary to the Queen, and in the ensuing year became full Academician. On the death of Dean Stanley, Boehm was commissioned to execute his sarcophagus in Westminster Abbey, and his achievement, a recumbent statue, has been pronounced to be one of the finest pieces of portrait sculpture of modern times. He executed the equestrian statue of the duke of Wellington at Hyde Park Corner, and designed the jubilee (1887) coinage. He died suddenly in his studio at South Kensington on 12th December 1890.

Boghaz Keui, a small village in Asia Minor, N.W. of Yuzgat in the Angora vilâyet, remarkable for the ruins and rock-sculptures in its vicinity. The ruins are those of "a ruling city of the Oriental type,

unaffected by, and earlier than, Greek influence"; and they have generally been identified with *Pteria*, a place taken by Croesus after he had crossed the Halys (Herodotus, i. 76).

The city walls, the acropolis, and the palace are of great archaeological interest. Excavations made on the site by M. Chantre led to the discovery of a number of tablets with cuneiform inscriptions, some in a primitive Cappadocian dialect which has not yet been read, and of small objects of interest. The rock-sculptures, Yasili Kaya, 1½ miles east of the city, belong to a distinct style of art which has been called "Hittite," but many traces of Assyrian influence survive. It seems probable "that the cult of the great earth-mother (Cybele) and her son (Attis) supplies the motive of these reliefs, and that it was dominant in the city below them." Another view is that the sculptures commemorate an historical event. At Euyuk, about 12 miles north of Boghaz Keni, is a gateway flanked by sphinxes and a series of remarkable sculptures which, like those at Yasili Kaya, represent, according to Professor Ramsay, "scenes and figures in the ritual of a religion which can be traced over the greater part of Asia Minor, modified by local circumstances." Here also M. Chantre made interesting discoveries.

Bognor, a seaside resort in the Chichester parliamentary division of Sussex, England, 7 miles S.E. of Chichester, and 28 W. of Brighton by rail. Besides the parish church, there are a Roman Catholic priory and church, and Congregational, Wesleyan, and Methodist chapels; also a theatre, assembly rooms, and numerous convalescent homes, including establishments belonging to the Merchant Taylors' Company, the Ragged School Union, East London Hospital for Children, and the Surrey Women's Jubilee Memorial Committee. A pier pavilion and a promenade are other features. Area of urban district, 885 acres; population (1881), 3290; (1901), 6180.

Bogorodsk, a district town of Central Russia, in the government and 27 miles by rail E.N.E. of Moscow, near the railway to Nijni, with which it is connected by a branch line. It is built on the bank of the Klyazma river, and has several woollen and silk mills. Population, 11,210.

Bogotá, or SANTA FÉ DE BOGOTÁ, the chief town of the department of Cundinamarca, Colombia, South America, and the capital of the republic, situated on a high tableland 8985 feet above sea-level, on the San Francisco river at its junction with the Rio de Bogotá. From Barranquilla it is distant, by the nearest traffic route, 683½ miles, communication being by rail to Facatativa 24 miles, from Facatativa to La Dorada by mules 45 miles, from La Dorada to Honda by rail 22 miles, and from Honda to Barranquilla, by steamers on the Magdalena river, 592½ miles. There is also communication with the Magdalena by an American express service of waggons drawn by horses. A railway is projected to Zupaquirá. Within recent years the city has greatly extended, and occupies an area of about 2½ miles in length by 1½ in breadth. The streets, though narrow, are well laid out and well kept, and lighted by electricity. There is an excellent water-supply, besides a telephone service and other modern conveniences. A special feature are the fine squares in the French fashion adorned with fountains. In the Plaza Bolívar is a statue of Liberty by Tenerain, a pupil of Canova, and in the Plaza Santander a statue of General Santander by Costa of Florence. Among the public buildings are the palace of San Carlos occupied by the president of the republic, and the palaces of Santo Domingo and San Francisco occupied by Government offices. The university has a high reputation, and the city, on account of its appreciation of art and letters,

has acquired the surname of the "Athens of South America." The population is about 125,000.

Bogra, or BAGURA, a town and district of British India, in the Rajshahi division of Bengal. The town is situated on the right bank of the river Karatoya. Population (1881), 6179; (1891), 6584. It possesses a high school, two printing-presses, and a public library.

The district of BOGRA lies west of the main channel of the Brahmaputra. It contains an area of 1452 square miles. Population (1881), 734,751; (1891), 817,494, showing an increase of 11 per cent.; average density, 563 persons per square mile. Classified according to religion, Hindus numbered 154,296; Mahomedans, 661,100; Christians, 15, of whom 7 were Europeans; "others," 2083. In 1901 the population (on a reduced area) was 849,955, showing a further increase of 11 per cent. Land revenue and rates (1897-98) were Rs.5,35,327; the number of police was 230; the number of boys at school (1896-97) was 15,484, being 26·6 per cent. of the male population of school-going age; the registered death-rate (1897) was 30 per thousand. The former production of indigo is extinct, and the industry of silk-spinning is decaying. There is no town with as many as 10,000 inhabitants, trade being conducted at riverside marts. Nor are there any metalled roads. The Northern Bengal railway runs through a corner of the district for 39 miles, on its way north to Darjiling.

Boguslav, a town of Western Russia, government and 69 miles S.E. of Kieff. It dates from the 12th century, and has a population of 13,000. Machinery works, woollen cloth mills, and distilleries are its leading industries.

Bohain, a town in the arrondissement of Saint Quentin, department of Aisne, France, 30 miles in direct line N. by W. of Laon, on the railway from St. Quentin to Lille. The Torrents Canal affords communication with the Scheldt. Local industry is mainly associated with the production of woollen fabrics, including French cashmeres, gauzes, and various fancy stuffs. Population (1881), 6380; (1901), 6899.

Bohemia (German, *Böhmen*; Bohemian or Czech, *Čechy*), a kingdom and crown-land of the Austro-Hungarian monarchy, of which it constitutes the most northern part. Population (1869), 5,106,069 (of which it was estimated that there were 20 Germans to every 32 Slavs); (1880), 5,560,819; (1890), 5,843,094, which is equivalent to 293 inhabitants per square mile; (1900), 6,318,280. The density of population is greatest in the northern or industrial districts. The proportion of females to males in 1891 was 1071 to 1000: 62·38 per cent. were Czech and 36·94 German, 96 per cent. Roman Catholic, 2·17 per cent. Protestant, and 1·6 per cent. Jews. Next to Galicia, Bohemia has the largest population of any Austrian crown-land, and about 24·45 per cent. of the entire population of Austria. In 1896 the marriage-rate was 8·31; the birth-rate 37·29, or, excluding still-births, 36·04; and the death-rate 24·31 per 1000. Of the births 14·41 per cent. were illegitimate, an increasing ratio. Bohemia sends 110 members to the Reichsrath, or central parliament in Vienna, 18 of whom are returned by the new universal suffrage curia; 65 are Czech and 45 German, including the large landed proprietors of both nationalities. Education is provided for by two universities, one German and the other Czech (4178 students in 1897), two polytechnics (1227 students), an academy of fine art, a mining academy, 4 theological seminaries, 56 gymnasias, 22 real-gymnasias, 311 intermediate and 5149 elementary schools (the proportion of Czech and German being as 3 to 2), with an average attendance of 98·5 per cent. of all children,

together with about 860 other state, municipal, and private educational establishments, mostly technical. The proportion of illiterates, the lowest in Austria, sank from 8·15 per cent. in 1880 to 5·8 per cent. in 1890. In 1898 there was a total of 618 periodicals (384 Czech, 220 German, 2 English, and 12 polyglot).

Despite its great industrial development, about 45·25 per cent. of the population is still engaged in agriculture and forestry, 39·65 being occupied in mining and other industries and in trade. Bohemia produces 64·20 per cent. of the whole Austrian beetroot crop (Moravia coming next with 30 per cent.), in addition to the largest crops of wheat, rye, barley, oats, and potatoes, and considerable quantities of other agricultural produce. Nearly 49 per cent. in value of the entire yield of the Austrian mines falls to Bohemia, whose principal products are lignite, coal, iron ore, together with smaller quantities of gold, silver, and other metals, several of which are only mined in this crown-land. Its wealth of coal (40 million metric centals coal and 169 million m.c. lignite in 1897), together with the improvements in the refining process, have made it the chief centre of the iron industry, in which it has now begun to compete with Germany. Sugar-refining is of growing importance, as is also the manufacture of railway rolling-stock, while the old staple industries show a marked advance. In 1890 it possessed 35 per cent. of all the factories in Austria, 38 per cent. of the entire motive power, and 41 per cent. of the factory hands—figures which show that it holds the first place for industrial enterprise on the largest scale. Between 1870 and 1890 there has been an increase in the number of horned cattle, 2,022,305 (+420,290); pigs, 514,367 (+286,187); horses, 215,729 (+25,392); and goats, 334,417 (+140,144); and a reduction in the number of sheep, 423,602 (−682,688). Bohemia is the most favoured portion of the monarchy in the matter of communications, possessing (in 1897) 5228 kilometres of railway, 30 per cent. of the total length in Austria; 28,156 kilometres of roads, and 1160 kilometres of navigable rivers and canals, which (*via* the Elbe) afford it cheap access to the sea. In 1895 2,535,000 tons of goods were forwarded in both directions on the Elbe by 21,200 vessels, of which nearly 3000 were steamers. There are 1347 post and 718 telegraph offices, with 7351 kilometres of line and 20,227 kilometres of wire.

Political Importance.—As the situation in Bohemia is the pivot upon which Austrian domestic politics turns, and has turned for a generation past, it may be well to recall some of the principal factors in the problem. The national movement among the Czech people, revived in 1848, has made immense progress since the Czech representatives abandoned their policy of parliamentary abstention in 1879. During the term of office of Count Taaffe (1879-93) they secured in detail a series of important concessions—the language ordinances of 1880 and 1886, which ultimately established Czech predominance in the public service, the founding of a Czech university (1882) and of numerous Czech gymnasia, together with the State support for the Czech Academy of Science at Prague, &c. They at the same time so consolidated their position in the Czech provinces and the Reichsrath that the Government found itself constantly obliged to purchase their support by fresh concessions. After the failure of Count Taaffe's effort to overcome the nationality deadlock by a heroic electoral reform nearly equivalent to universal suffrage, and the breakdown of the German-Polish-Clerical coalition that followed his fall, the Czechs won their greatest triumph in the issue by the Badeni ministry of the notorious *language ordinances* of April 1896. These ordinances, which rendered a thorough knowledge of the Czech and German

languages obligatory upon all officials in Bohemia and Moravia, did not merely gratify Czech national sentiment, but were of considerable material advantage to that nationality, inasmuch as they almost created a monopoly for the bilingual Czech claimants. The grant of the German demand for administrative separation of the German and Czech districts of Bohemia and Moravia, with the official use of German in the former and of Czech in the latter, would not only have constituted a hindrance to ultimate autonomy, but would have increased the competition and diminished the number of appointments open to Czech official aspirants. This last concession to their opponents was regarded by the Germans as evidence that the centralistic constitution was in serious danger, and that the Czechs and their allies were within measurable distance of realizing their aims. These were, first, the restoration to the provincial diets of the right of electing the Reichsrath or central parliament (a privilege abolished in 1873), and, ultimately, a purely federal constitution. A compromise between the nationalities has hitherto proved impossible. The struggle, accompanied at times by violence involving destruction of life and property and repeated suspensions of constitutional rights, had at one time nearly destroyed the Austrian parliamentary system and even threatened the integrity of the dual monarchy. The withdrawal of the last of the series of language ordinances (September 1899) only replaced German obstruction by that of the Czechs, which upset the ministry and again rendered parliamentary government impossible. The truce brought about by the Körber ministry in 1901 permitted the passage through the Reichsrath of an important economic scheme, comprising a large extension of railways and canals, and seemed to furnish the basis of an eventual political compromise.

The remarkable growth of Czech influence has been promoted by the rapid increase of the Czech population in the towns, whither they are attracted by higher wages. This increase is coincident with and one of the consequences of the development of industry on a large scale in Austria, which is the work of the past quarter of a century. The establishment of factories created a demand for hands, which the German population alone was unable to supply. Indeed, where a German proletariat existed, it was at a disadvantage in the competition with the Czechs and Poles owing to its higher standard of living. Moreover, the cheaper and more docile Slav labourers are less attached to their native place than are the Germans, and they marry at an earlier age—two circumstances that still continue to promote their relative increase in the industrial centres. This tendency has been welcomed by the State and the Church for different reasons. Apparently in view of the rooted discontent of the German population with the position of a minority in a country where they had been accustomed to rule, the State has consistently and successfully strengthened the Slav element as a precaution against a possible *Germania irredenta* agitation, so that now the Czechs are all-powerful in the administration of Bohemia and Moravia, including the German districts on the frontier. The Germans occupy a broad belt of the western and northern border adjoining Bavaria and Saxony, while the Czechs are settled in the centre and the southern districts of Bohemia. There are several grounds for the action of the Roman Catholic Church in the same direction. The clergy, as well as the reactionary nobles, regard the nationality struggle as a useful means of diverting attention from their own privileges. Like the large manufacturers, the priests find the Slavs more docile to their teachings and more tolerant of their pretensions. Moreover, the bulk of the priests are themselves of the Slav

race. While the Austrian episcopacy is in an exceptionally favourable pecuniary position, the minor clergy are badly paid. The profession has therefore little attraction for the well-to-do middle classes. The consequence is that it is largely recruited among the Slav peasantry, so that the priests even of the German districts of Bohemia and Moravia are predominantly Czech. Such a priest, filled with a sense of his own dignity and authority, enters his sacred office not merely with an unenlightened racial *Chauvinism*, but with an almost personal grudge against the better educated leaders of the German element, and indeed against the less deferential German part of his flock altogether. The irritation produced by this attitude of the Catholic clergy accounts for a good deal in the movement in favour of wholesale conversion to Protestantism, which has made most progress in Bohemia. The motive of the promoters of the "Emancipation from Rome" movement, however, is to make German Austria more palatable to Protestant Germany in view of future eventualities. The Pan-Germanic movement finds encouragement and support among an important section of the German manufacturers of Bohemia on other than national grounds. These argue that Austrian industry has now reached a stage at which it can compete successfully with that of Germany. The latter, it is true, has had the start, but Austrian industry has the advantage in the matter of good taste, a point in which Germany is deficient. Moreover, Austria has numerous undeveloped resources, which, if properly utilized, would place it on a level with its rival. The most pressing requirement of the Austrian manufacturers is fresh markets and liberty for their expanding energies, and this, it is urged, would be at once provided by some form of amalgamation with the German empire. Other sections of the industrial community hold, however, that Austrian industry is not yet strong enough to dispense with the high protectionist tariff that now excludes German products. The recent aggravation of the nationality conflict has done less damage to trade in the Czech provinces than might have been expected, the prevailing system of credit having opposed practically insurmountable difficulties in the way of the threatened boycott of political opponents.

Böhmisch-Leipa (Czech, *Česká Lipa*), the chief town of a district in North Bohemia, on the Polzen, a tributary of the Elbe. It has a considerable industry, including the works of the Bohemian Northern railway, textile and calico-printing factories, and the manufacture of pianos, glass, dextrine and starch, sweetmeats and preserves, sugar, stores, the preparation of furs and skins, brewing and corn-milling. Population (1890), 10,406; (1900), 10,674; chiefly German and Catholic.

Böhmisch-Trübau (Czech, *Třebová Česká*), an old town in the government-district of Landskron, in North-East Bohemia, Austria, near the Moravian frontier. It has considerable textile industry (linen spinning and weaving), brewing and the preparation of malt, and trade in flax, which is extensively cultivated in the district. The inhabitants (4982 in 1890, 6040 in 1900) are Czech.

Boilers.—In the article STEAM-ENGINE (*Encyclo-*

pædia Britannica, vol. xxii.) the general principles underlying the design and use of all steam boilers are stated, and several kinds of boilers are illustrated. The examples given still fairly agree with the present practice of the types described, but during the last few years some changes have taken place in matters of detail, and several new designs have come into use. It is with these that this article is intended to deal.

Land Boilers.—The boilers most generally used in large mills and manufactories at the present time are the "Lancashire" and its modification the "Galloway." Cross-sections of these are illustrated in the *Encyclopædia Britannica*, vol. xxii. p. 497. They are usually from 26 to 30 feet long, with diameters from 6 feet 6 inches to 8 feet. The working pressure is in some cases as high as 200 lb per square inch, but is usually about 60 lb per square inch in the older boilers, 100 to 120 lb in those supplying steam to compound engines, 150 lb to 170 lb where the engines are triple expansion, and 200 lb where they are quadruple. The furnace flues are now generally made in sections from 3 feet to 3 feet 6 inches long, each from one plate, the seam being sometimes riveted but more usually welded. The rings are flanged outwards at the ends, and are connected together by "Adamson" joints (Fig. 1). It will be seen that these joints do not expose any rivets or double thickness of plate to the action of the fire, and they serve also as strengthening rings to prevent collapse of the furnace. In such boilers the long flues beyond the fire-bridge form combustion-chambers in which the furnace gases may be completely burned. The amount of heat-absorbing surface provided in proportion to the grate surface is not so large as in some types of tubular boilers; and, although they are regarded as fairly economical, they do not give such good results as are obtained with some more complicated forms. The space occupied by them, and their weight in proportion to the power developed, are both large; but their design is one which affords great facilities for easy inspection and cleaning of all the vital parts. The great amount of water they contain, and the large area of the water-level, provide a considerable reservoir of energy for fluctuations of power or of firing, and a reserve of water for variations of the feed supply. These reasons lead to their employment in situations where the feed-water is impure or very skilled attention is not available, and where in addition space and weight are not very important considerations.

In some large works water-tube boilers are used. Two types of these boilers will be described.

The "Babcock and Wilcox" boiler, illustrated in Fig. 2, consists of a horizontal cylinder forming a steam-chest, having dished ends and two specially constructed cross-boxes riveted to the bottom. Under the cylinder is placed a sloping nest of tubes, under the upper end of which is the fire. The sides and back of the boiler are enclosed in brickwork up to the height of the centre of the horizontal cylinder. Suitable brickwork baffles are arranged between the tubes themselves, and between the nest of tubes and the cylinder, to ensure a proper circulation of the products of combustion. The nest of tubes consists of several separate elements, each of which is formed by a front and back header made of wrought steel of sinuous form connected by a number of tubes. The upper ends of the front headers are connected by short tubes to the front cross-box of the horizontal cylinder, the lower ends being closed. The upper ends of the back headers are connected by longer pipes to the back cross-box, and their lower ends by short pipes to a horizontal mud drum to which a blow-off cock and pipe are attached. The headers are furnished with holes on two opposite sides; those on one side form the means of connexion between the headers and tubes, and the others allow access for fixing the tubes in position and cleaning. The outer holes are oval, and closed by special fittings shown

FIG. 1.—"Adamson" Joint.

"Babcock and Wilcox."

in Fig. 3, the watertightness of the joints being secured by the outer cover-plates. The holes being oval, the inside fitting can be placed in position from outside, and it is so made as to cover the opening and prevent any great outrush of steam or water should the bolt break. Any desired working pressure can be provided for in these boilers; in some special cases it rises as high as

the bottom of this drum, where the heating is not great, and where therefore their presence will not be injurious.

Locomotive Boilers.—At the present time locomotive boilers do not differ very much from the type illustrated in the *Encyclopædia Britannica*, vol. xxii. p. 498, except that they are considerably larger and arranged for a higher working pressure than formerly. A pressure of 200 lb per square inch is common on the North-Eastern and London and North-Western Railways, while 230 lb per square inch is being used in some instances on the Continent and in America. One of the largest of recent engines, made for the Lancashire and Yorkshire Railway Company (illustrated in the *Engineer* for 17th March 1899), has a working pressure of 175 lb per square inch, a grate surface of 26 square feet, and a total heating surface of 2052 square feet. There are 239 tubes, 2 inches in outside diameter and 15 feet long. The shell of the boiler is 4 feet 9 inches in diameter. The fire-box is of copper, and the stays of bronze set at the usual pitch of 4" x 4". The rest of the boiler, including the tubes, is of steel. In some of the large boilers, especially on the London and South-Western Railway, water-tubes have been fitted. These are usually about 2½ inches in diameter, and are inclined across the fire-box to facilitate the circulation of the water. They are expanded into and beaded over the side plates of the fire-box, and the outer plates of the shell are provided with stays passing through the tubes. They considerably increase the heating surface, and are regarded as very efficient. Experience shows that they stand well.

FIG. 2.—Babcock and Wilcox Water-tube Boiler fitted with Superheaters.

500 lb per square inch. Like all water-tube boilers, they require to be frequently cleaned if impure feed-water is used; but the straightness of their tubes enables their condition to be ascertained at any time when the boiler is out of use, and any accumulation of scale to be removed. The superheaters which are sometimes fitted consist of two cross-boxes or headers placed transversely under the cylindrical drum and connected by numerous C-shaped tubes. The steam is taken by an internal pipe passing through the bottom of the drum into the upper cross-box, then through the C tubes into the lower box, and thence to the steam-pipe. When steam is being raised the superheater is flooded with water, which is drained out through a blow-off pipe before communication is opened with the steam-pipe.

Another type of water-tube boiler in use for stationary purposes is the "Stirling," illustrated in Fig. 4. This boiler usually consists of five horizontal drums, of which the three upper ones form the steam space and the two lower contain the water. In some cases only one lower chamber is used. The lower drums are connected to each other at about the middle of their height by horizontal tubes, and to the upper drums

by numerous nearly vertical tubes which form the major portion of the heating surfaces. The central upper drum is at a slightly higher level than the others, and communicates with that nearest the back of the boiler by a set of curved tubes entirely above the water-level, and with the front drum by two sets—the upper one being above, and the lower entirely below, the water-level. The whole boiler is enclosed in brickwork, into which the supporting columns and girders are built. Brickwork baffles compel the furnace gases to take specified courses among the tubes. It will be seen that the space between the boiler front and the tubes forms a large combustion-chamber, into which

FIG. 3.—Handhole Fittings.

all the furnace gases must pass before they enter the spaces between the tubes; another chamber is formed between the first and second sets of tubes. The feed-water enters the back upper drum, and must all pass down the third set of tubes into the lower drum before it reaches the other parts of the boiler. Thus the coldest water is always where the temperature of the furnace gases is lowest; and as the current through the lower drum is slight, the solid matters separated from the feed-water while its temperature is being raised have an opportunity of settling to

FIG. 4.—Stirling Boiler.

Marine Boilers.—For marine work the varied conditions to be fulfilled in different classes of vessels have led to the employment of several different types of boilers. In merchant vessels, except in a few passenger steamers making short runs, ordinary cylindrical return-tube boilers are always used, while in war vessels and in a few passenger vessels of high speed engaged in cross-Channel services various forms of water-tube boilers are found. The great difference in the weights of these types forms the principal

reason for the adoption of the water-tube system in war vessels. According to the particulars given by Sir A. J. Durston and Mr H. J. Oram, R.N., in a paper read before the Institution of Civil Engineers in 1899, ordinary cylindrical boilers and boiler-room fittings weigh 130 lb per indicated h.p. The similar weights of the Belleville water-tube boilers fitted in similar vessels only amount

Fig. 9. Brown's Arched & Ribbed Type

Fig. 7. Deighton Type

Fig. 10. Brown's Cambered Section

to 100 lb, while the weights of various types of small tube water-tube boilers and their fittings as supplied to cruisers amount to 55 lb, and as adopted in torpedo-boat destroyers are less than 40 lb per indicated h.p.

The sketches of the ordinary cylindrical marine boiler, both single and double ended, given in the *Ency. Brit.* vol. xxii. p. 499, still *Cylindrical.* fairly represent existing practice; but, mainly owing to the improvements in the manufacture of steel plates, some modifications in detail have become common. Circular steel boiler-plates can now be procured up to 11½ feet in diameter, of thicknesses ranging from ¾ inch to 1½ inches; and rectangular plates of the same thicknesses are made of all widths up to 11 feet and of such length as will keep their weight from exceeding 7 tons. As a result, many single-ended boilers have only one plate in their length, and double-ended boilers only two; in this way some of the circular seams of rivets in the shell are avoided. Boilers are also made of larger size and for higher steam-pressures than formerly. Pressures up to 260 lb per square inch have been used at sea with ordinary cylindrical boilers in some few instances, and several boilers with a diameter of 17 feet are now successfully working at a pressure of 210 lbs. The furnaces used in the smaller sizes are often of the plain cylindrical type, of thicknesses up to ¾ inch; but for large furnaces some of the corrugated or ribbed types are generally adopted. Sketches of the sections of these are given in Figs. 5-10. The first three are made from plates originally rolled of a uniform thickness, the differences being only in regard to the shapes of the corrugations; while in the second three the plates are rolled with ribs or thickened portions at distances of 9 inches. In the more recent boilers steam-chests or domes are not used, sufficient steam space being provided in the cylindrical shell.

This type of boiler contains a considerable quantity of water in proportion to the heating surfaces. The thickness of the plates, and the numerous stays required to support the flat portions, render it

heavy in proportion to the evaporative power; but experience shows it to be durable, and not very expensive in upkeep. The provision of combustion-chambers, which the furnace gases must traverse, and the change of direction which they must take before entering the tubes, give an opportunity for the gases to be burned before they are cooled below the ignition-point; and this form of boiler is therefore fairly economical under ordinary conditions. To these qualities of economy and durability is due its almost universal adoption in merchant steamers, where questions of weight and compactness are not so important as in war vessels. The boilers are generally worked with chimney or "natural" draught; but forced draught is not uncommon, the Howden system being that usually adopted. In this the ashpits are closed, and the air for combustion is supplied to the fire partly through the grate-bars and partly through openings in the furnace front above the fire, having previously passed through a regenerative apparatus where it absorbs heat from the smoke, &c., leaving the ordinary boiler-tubes.

In all recent war vessels, both of the British and foreign navies, the boilers fitted are exclusively of the water-tube type. These may be divided into two distinct classes:—(1) those in which large tubes ranging from 4½ inches to 1½ inch in diameter are used; and (2) the "Express" boilers, in which the tubes are from 1 inch to 1½ inch diameter. The former are adopted in the larger ships, the latter in the smaller vessels which do not keep the sea for long periods, and in which the conditions of durability are not so important as to outweigh the requirement of extremely high power with a minimum of weight.

The large-tube type hitherto generally used is the "Belleville" boiler (which, however, has been adversely criticized, and was reported against by the Admiralty Boiler Committee "Belleville." in 1901). Two views of this boiler are shown in Fig. 11. It is composed of two parts, the boiler proper and the "economizer." Each of these consists of several sets of elements placed side by side; those of the boiler proper are situated immediately over the fire, and those of the economizer in the uptake

FIG. 11.—Belleville Boiler.

above the boiler, the intervening space being designed to act as a combustion-chamber. Each element is constructed of a number of straight tubes connected at their ends by means of screwed joints to junction-boxes which are made of malleable cast iron. These are arranged vertically over one another, and, except in the case of the upper and lower ones at the front of the boiler, each connects the upper end of one tube with the lower

end of the next tube of the element. The boxes at the back of the boiler are all close-ended, but those at the front are provided with a small oval hole, opposite to each tube end, closed by an internal door with bolt and cross-bar; the purpose of these openings is to permit the inside of the tubes to be examined and cleaned. The lower front box of each element of the boiler proper is connected to a horizontal cross-tube of square section, called a "feed-collector," which extends the whole width of the boiler. When the boiler is not in use, any element can be readily disconnected and a spare one inserted. The lower part of the steam-chest is connected to the feed-collector by vertical pipes at each end of the boiler, and prolongations of these pipes below the level of the feed-collector form closed pockets for the collection of sediment. The tubes are usually made of seamless steel, although lap-welded tubes have sometimes been used. They are generally about $4\frac{1}{2}$ inches in external diameter; the two lower rows are $\frac{3}{8}$ inch thick, the next two rows are $\frac{1}{2}$ inch, and the remainder about $\frac{3}{4}$ inch. The construction of the economizer is similar to that of the boiler proper, but the tubes are shorter and smaller, being generally about $2\frac{1}{2}$ inches in diameter. The lower boxes of the economizer elements are connected to a horizontal feed-pipe which is kept supplied with water by a feed-pumping engine, and the upper boxes are connected to another horizontal pipe from which the heated feed-water is taken into the steam-chest. Both the boiler proper and the economizer are enclosed in a casing which is formed of two thicknesses of thin iron separated by non-conducting material and lined with fire-brick at the part between the fire-bar level and the lower rows of tubes. Along the front of the boiler, above the level of the firing-doors, there is a small tube having several nozzles directed across the fire-grate, and supplied with compressed air at a pressure of about 10 lb per square inch. In this way not only is additional air supplied, but the gases issuing from the fire are stirred up and mixed, their combustion being thereby facilitated before they pass into the spaces between the tubes. A similar air-tube is provided for the space between the boiler proper and the economizer, and further combustion of the furnace gases is found to take place in this chamber. Any water suspended in the steam is separated in a special separator fitted in the main steam-pipe, and the steam is further dried by passing through a reducing-valve which ensures a steady pressure on the engine side of the valve, notwithstanding fluctuations in the boiler. The boiler pressure is usually maintained at about 50 lb per square inch in excess of that at which the engines are working, the excess forming a reservoir of energy to provide for irregular firing or feeding.

Another type of large-tube boiler which has been used in the British and in other navies is the "Niclausse," shown in Fig. 12.

It is also in use on land in several electric-light installations. It consists of a horizontal steam-chest under which is placed a number of elements arranged side by side over the fire, the whole being enclosed in an iron casing lined with fire-brick where it is exposed to the direct action of the fire. Each element consists of a header of rectangular cross-section, fitted with two rows of inclined close-ended tubes, which slope downwards towards the back of the boiler with an inclination of 6° to the horizontal. The headers are usually of malleable cast iron with diaphragms cast in them, but sometimes steel has been employed, the bottoms being closed by a riveted steel plate, and the diaphragms also made of the same material. The headers are bolted to socket-pieces which are riveted to the bottom of the steam-chest, so that any element may be easily removed. The tube-holes are accurately bored, at an angle to suit the inclination of the tube, through the front and back of the headers and through the diaphragm, those in the header walls being slightly conical. The tubes themselves, which are formed of seamless steel, are of

peculiar construction. The lower or back ends are reduced in diameter and screwed and fitted with cap-nuts which entirely close them. The front ends are thickened by being upset, and the parts where they are to fit into the header walls and in the diaphragm are carefully turned to gauge. The upper and lower parts of the tubes between these fitting portions are then cut away, the side portions only being retained, and the end is termed a "lanterne." A small water-circulating tube of thin sheet steel, fitted inside each generating tube, is open at the lower end, and at the other is secured to a smaller "lanterne," which, however, only extends from the front of the header to the diaphragm. This smaller "lanterne" closes the front end of the generating tube, and the whole arrangement is such that when the tubes are in place only the small inner circulating tubes communicate with the

Fig. 12.—Niclausse Boiler—transverse section.

front space between the front of the header and the diaphragm, while the annular space in the generating tubes around the water-circulating tubes communicates only with the space between the diaphragm and the back of the header. The steam, therefore, formed in the tubes escapes from them into this back space, through which it rises into the steam-chest, whilst the space in the front of the header always contains a down-current of water supplying the inner circulating tubes. The tubes are maintained in position by cross-bars, each secured by one stud-bolt screwed into the header wall, and each serving to fix two tubes. The products of combustion ascend directly from the fire amongst the tubes, and the combustion is rendered more complete by the introduction of jets of high-pressure air immediately over the fire, as in the "Belleville" boiler.

The "Dürr" boiler, in use in several vessels in the German navy, and in 1901 fitted for trial in two vessels of the British navy, in some respects resembles the "Niclausse." The separate headers of the latter, however, are replaced by one large water-chamber, and instead of the tubes being secured

by a "lanterne" to two plates, they are fitted by conical joints to the inner plate only, the holes in the outer plate being closed by small round doors. The tubes are closed at the lower end, and circulation is provided for by a diaphragm in the water-chamber, and inner water-tubes as in the "Niclausse" boiler.

The "Lagrafel-D'Allest" boilers also have large tubes. They are necessarily arranged in pairs having one combustion-chamber common to both. Each of a pair consists of a nearly horizontal cylindrical steam-chest, connected at the ends with large flat water-chambers, between which the numerous water-tubes are fitted above the fire-level. The nests of tubes, except at the upper portion, do not extend the whole width of each of the pairs of boilers, but a space is left on the inner side of each to form a combustion-chamber. The grate-bars are placed below the tubes, and a fire-bridge is formed at the inner side of each fire, separating the grate from the combustion-chamber. On the outer side of the fires the iron casing of the boiler is protected by fire-brick lining. The spaces between the tubes of the lower row, and also of the upper horizontal row, are closed by suitably-shaped tiles, and iron plates are fitted to cover the upper portion of the spaces between the outside vertical rows of tubes. The products of combustion are therefore compelled to pass over the fire, under the lower horizontal row of tubes, over the fire-bridge into the combustion-chamber, thence returning in an opposite direction across all the tubes, and finally leaving the nest of tubes at its lowest part. The course of the gases thus bears a marked resemblance to that obtaining in the ordinary return-tube type of boiler.

FIG. 13.—Babcock and Wilcox Marine Boiler—longitudinal section.

The "Babcock and Wilcox" marine boiler is in use in the American and British navies and also in several yachts and merchant steamers.

A recent example is shown in Fig. 13. It consists of a horizontal cylindrical steam-chest placed transversely over a group of elements beneath which is the fire. Each element consists of a front and back header connected by numerous water-tubes which have a considerable inclination to facilitate the circulation in the boiler. The upper ends of the back headers are situated immediately under the steam-chest, and are connected to it by short nipples; by a similar means they are connected at the bottom to a pipe of square section which extends across the width of the boiler. Additional connexions are made by nearly vertical tubes between this cross-pipe and the bottom of the steam-chest, and also between the pipe and the feed-purifier. The front headers are connected at their upper ends, by means of long horizontal tubes, with the steam-chest, the bottom ends being closed. The headers are made of wrought steel, and except the outer pairs, which are flat on the outer portions, they are sinuous on both sides, the sinuosities fitting into one another. The tubes are $1\frac{1}{2}$ inch outside diameter, and are arranged in groups

of two, three, or four to nearly all of the sinuosities of the header, the purpose of this arrangement being to give opportunities for the furnace gases to become well mixed together, and to ensure their contact with the heating surfaces. Access for securing the tubes in the headers is provided by a hole formed on the other side of the header opposite each of the tubes, where they are grouped in threes or fours, and by one larger hole opposite each group of two tubes. The larger holes are oval, and are closed by fittings similar to those used in the land boiler (Fig. 3). The smaller holes are conical, with the larger diameter on the inside, and are closed by special conical fittings; the conical portion and bolt are one forging, and the nut is close-ended. In case of the breakage of the bolt, the fitting would be retained in place by the steam-pressure. The feed-purifier is a small horizontal cylinder placed above and in front of the steam-chest, and connected to it by a pipe which provides an uninterrupted communication between the upper parts of the two chests, so that when in use the upper part of the purifier is always fully charged with steam. The lower half of the small chest is divided into several compartments by means of diaphragm plates. The feed-water is led into the chest in the upper part at the middle of the length, and falls over a dished plate through the steam in the form of a cascade. Its temperature is thus raised nearly to the boiling-point, and most of the impurities are separated out in a solid form and deposited in the various chambers through which the water flows. The purified feed-water passes from the end divisions down the vertical pipes into the square-sectioned cross-pipe, whence it is carried into the general circulation of the boiler.

The other boilers to be described are the types, sometimes called "Express" boilers, which are largely used in torpedo-boats, torpedo-boat destroyers, and in small cruisers, where the most important requirement is very high power with a very small weight of boiler. They all consist of a horizontal steam-chest in the upper part, connected by numerous small tubes of from 1 inch to $1\frac{1}{4}$ inch outside diameter to two or three smaller horizontal chambers placed near the fire-level. The tubes are always made of seamless steel, and are usually galvanized on the outside by an electrical process.

In the "Normand" boiler (Fig. 14) both the upper and lower chambers are considerably longer than the fire-grate, and are connected by large pipes at each end of the boiler, outside the action of the fire, which serve as downcasts and facilitate the circulation of water. The heating-tubes are all bent to the forms shown in the cross-section; the outer rows usually enter the steam-chest at about the water-line, and the others lower down. The two inner rows on each side, for a part of the length of the fire-grate, touch one another along nearly all their length, and are separated only at their ends where they have to enter the horizontal chambers through separate holes. Arranged thus they form "water-walls." The two outer rows on each side are similarly arranged along the whole length of the boiler, and protect its outer casing from the action of the fire. These water-walls direct the flow of the products of combustion amongst all the heating-tubes. The ends of the casing, between the tubes and the fire-grate, are protected by fire-brick linings.

In the "Yarrow" boiler, which is shown in cross-section in Fig. 15, the tubes are all straight, and there are no water-walls. The products of combustion pass across all the tubes the whole length of the boiler. The outer casings are made of double thickness, with an air-space between them. Outside circulating pipes, similar to those in the "Normand" boiler, are occasionally fitted, but it is often found that there is sufficient circulation without them. In the larger boilers the inner rows of tubes are slightly larger than the others, and are arranged with wider spaces between them, and the lower chambers are made with riveted plates, access to examine the tube ends being obtained through manholes in the ends. In smaller boilers the lower parts of the chambers are portable, being bolted to the tube-plates.

The "Blechynden" boiler bears considerable resemblance to the "Yarrow" boiler, but the heating-tubes, instead of being straight, are all slightly curved. The object is to enable any of them to be drawn out or replaced without disturbing the remainder, the curvature permitting them to be led through several small holes in the upper part of the steam-chest which are closed by ordinary doors. In the earlier type the outer rows of tubes form water-walls at their lower part to protect the outer casings; but their upper portions, not being in contact, permit the furnace gases to pass between them. In the more recent form there are no water-walls, but a baffle is fitted between the tubes to ensure that the products of combustion take a definite course amongst them. Each lower chamber is connected to the upper

chamber by four down-pipes placed outside the casing. These are of comparatively small diameter, and are designed principally as part of the framework. There are also two larger outside circulating pipes at one end of the boiler.

The "Reed" boiler resembles the "Normand" in some respects,

but the tubes are longer and more curved, and there are no water-walls, the products of combustion passing between all the tubes as in the "Yarrow" boiler. The tubes, in "Reed," instead of being expanded into the plates of the chambers, are fitted at each end with specially designed screw and nut connexions,

Fig. 14.—Normand Boiler.

which enable them to be quickly taken out and replaced in case of need. The tubes are somewhat reduced in diameter at their lower ends, enabling the lower connexions to be smaller than the upper, and thus permitting smaller lower chambers to be used. Access to the lower tube connexions is obtained by means of numerous doors arranged along the lower chambers. Outside circulating pipes are provided at each end as in the "Normand" boiler.

Mr J. I. Thornycroft has introduced two types of water-tube boiler, both of which have been largely used.

One, generally known as the "Thornycroft,"

as the "Speedy" boiler, has only one fire-grate; the other, known as the "Daring" boiler, has two. In both types there is one large steam and water upper cylinder; while the "Speedy" boiler has two, and the "Daring" boiler three, lower chambers, which in each

Fig. 15.—Yarrow Boiler.

case are connected to the upper chamber by outside circulating tubes as well as by the numerous small heating-tubes. The rows of tubes nearest the fire form water-walls, except near their lower ends, while the other rows form water-walls except near their upper ends; the intervening spaces act as flues through which the furnace gases must pass on their way from the fire to the chimney. The peculiar feature of these boilers is that all the heating-tubes discharge into the steam-space above the water-line, whereas in all the other boilers they enter below the water-level.

All the small-tube boilers described are worked with strong forced draught when full power is desired, the air-pressure employed sometimes exceeding 4 inches of water-column. Owing to the rapidity with which the products of combustion are hurried amongst the tubes, where no further combustion can take place, if some of the gases are not completely burned, only part of their heat can be given up; for instance, in a "Yarrow" boiler working at full power, the time taken for the products of com-

bustion to pass across all the tubes is less than one quarter of a second. It follows that at very high rates of working these boilers cannot be economical in coal consumption, and it is only their extreme lightness in proportion to the power they yield that determines their suitability for the special purposes for which they are employed. (J. T. Mr.)

Boise, capital of Ada county and of the state, Idaho, U.S.A., in the valley of Boise river, in 43° 37' N. lat. and 116° 12' W. long. Its houses are in great part heated by water brought in pipes from hot springs situated about 2 miles from the town. Here terminates a branch of the Oregon short line railway from Nampa. Boise is a supply-point for miners in the neighbouring mountains. Population (1880), 1899; (1900), 5957.

Bois-le-Duc, 'S HERTOGENBOSCH or 'S BOSCH, the capital of the province of North Brabant, Holland, 28 miles S.S.E. of Utrecht, at the confluence of the Dommel and Aa. It is the market of the fertile Meiry district, and does considerable trade with Dordrecht and Rotterdam, Nimeguen and Arnheim, Maastricht and Liège. The industrial features include cigar factories. A new station was built in 1894. In the same year the seminary for teachers ceased to exist. In the provincial museum are interesting Roman and German antiquities. Population, 30,517.

Boissier, Marie Louis Gaston (1823—), French classical critic, and secretary of the French Academy, was born at Nîmes on the 15th August 1823. The Roman monuments of the place of his birth very early attracted his attention, and drew him insensibly to the study of ancient history. He made epigraphy his particular theme, and, while still a youth, became a teacher of rhetoric in his native town. In 1846 M. Gaston Boissier was appointed professor of that science at Angoulême, where he lived and worked for ten years without further ambition. A travelling inspector of the university, however, passing through Angoulême, happened to hear him lecture, and M. Boissier was called to Paris to be professor at the Lycée Charlemagne. It was only in mature years that he began to be an author. The Académie des Inscriptions offered, in 1859, a prize for an essay on Terentius Varro. M. Gaston Boissier was induced

to compete, and he composed a monograph which was instantly recognized as a masterpiece, not only of learning, but of grace. In 1861 he received the responsible appointment of professor of Latin oratory at the Collège de France, and he became a pillar of the *Revue des Deux Mondes*. In 1866 he published what remains the most popular of his works, *Cicéron et ses Amis*, which has enjoyed a success such as rarely falls to the lot of a work of erudition and research. In studying the manners of ancient Rome M. Gaston Boissier had learned to recreate its society, and to reproduce its characteristics with the most exquisite vivacity. His next work of importance was *L'Opposition sous les Césars*, in which he drew a remarkable picture of the political decadence of Rome under the early successors of Augustus, and showed by an examination of the state of feeling in the successive strata of Roman society how low the sentiment of republican liberty had sunk. In 1875 M. Boissier published *La religion Romaine d'Auguste aux Antonins*, in which he analysed the elements which produced the great religious movement of antiquity that preceded the acceptance of Christianity. Through so many solid contributions to literature, M. Boissier had by this time drawn to himself the universal respect of scholars and men of letters, nor did he lack admirers in the polite world. He was manifestly destined for the French Academy, and on the death of Patin, in 1876, he was appropriately elected to fill the vacant place. He was received on the 21st of December 1876 by M. Ernest Legouvé, and his reply—his *discours de réception*—is a finished essay on the study of ancient society in the literatures of Greece and Rome. In 1880 M. Gaston Boissier published *Promenades archéologiques: Rome et Pompei*, of which a second series appeared in 1886. In 1895, on the death of Camille Doucet, he was elected to succeed him as perpetual secretary to the French Academy. M. Boissier is a representative example of the French talent for lucidity and elegance applied with entire seriousness to weighty matters of literature. He is a scholar of the highest attainments, but his learning seems cast about his shoulders with the elegance and decorum of a toga about those of a Roman senator. M. Boissier has not written very much, and he has never strayed from his single theme, the reconstruction of the elements of Roman society.

Boito, Arrigo (1842—), Italian poet and musical composer, was born at Padua on the 24th February 1842. He studied music at the Milan Conservatoire, but even in those early days he devoted as much of his time to literature as to music, forecasting the divided allegiance which was to be the chief characteristic of his life's history. While at the Conservatoire he wrote and composed, in collaboration with Franco Faccio, a cantata, *Le Sorelle d'Italia*, which was performed with success but has never been published. On completing his studies Boito travelled for some years, and after his return to Italy settled down in Milan, dividing his time between journalism and music. In 1866 he fought under Garibaldi, and in 1868 conducted the first performance of his opera *Mefistofele* at the Scala Theatre, Milan. The work failed completely, and was withdrawn after a second performance. It was revived in 1875 at Bologna in a much altered and abbreviated form, when its success was beyond question. It was performed in London in 1880 with success, but in spite of frequent revivals has never succeeded in firmly establishing itself in popular favour. Boito treats the Faust legend in a wider spirit than Gounod, but, in spite of many isolated beauties, his opera lacks cohesion and dramatic interest. Since writing *Mefistofele* Boito has produced no musical

work of any importance, although he was said to be at work in 1901 upon an opera on the subject of Nero, the libretto of which has already been published. His energies have been chiefly devoted to the composition of libretti, of which the principal are *Otello* and *Falstaff*, set to music by Verdi; *La Gioconda*, set by Ponchielli; *Amleto*, set by Faccio; and *Ero e Leandro*, set by Bottesini and Mancinelli. These works display a rare knowledge of the requirements of dramatic poetry, together with uncommon literary value. Boito has also published a book of poems and a novel, *L'Alfieri Meno*. The degree of Doctor of Music was conferred upon him in 1893 by the University of Cambridge.

Bokhara, or BUKHARA, a khanate of Central Asia, now in a state of vassalage to Russia. It occupies a broad strip of land on the right bank of the middle Amu-daria, between 37° and 41° N., 62° and 72° E., and is limited by the Russian Turkestan provinces of Amu-daria, Samarkand, and Fergana in the N.E., the Russian Pamir in the E., Afghanistan in the S., and the Russian Transcaspian territory and Khiva in the W. Its south-eastern frontier on the Pamirs is quite undetermined except where it touches the Russian dominions, there being a mountainous unpopulated territory which is visited alternatively by nearly quite independent Kirghiz and by Afghan patrols. With the khanates of Karateghin and Darvaz, as also those of Roshan and Shugnan, the area would be about 95,650 square miles; without the two latter, which have fallen under Afghan influence, about 75,600 square miles.

Bokhara may be divided into three parts. The western part, crossed now by the railway, is a plain, watered by the Zerafshan and by countless irrigation canals drawn from it. It has in the east the Karnak-chul prairie, covered with grass in early summer only, and in the north an intrusion of the Kara-kum sand desert. Land suitable for culture is only found in oases, where it is covered with irrigation canals, but these oases are very fertile. The cotton and mulberry trees are cultivated, as also all sorts of corn, including rice, and the vine. The middle portion is occupied by high plains, about 4000 feet in altitude, sloping from the Tian Shan, and intersected by numerous rivers (Surkhan, Kafirnagan, Waksh, and many smaller ones) flowing towards the Amu. This region, very fertile in the valleys and enjoying a cooler and damper climate than the lower plains, is densely populated, and agriculture and cattle-breeding are carried on extensively. Here are the towns of Karshi, Kitab, Shaar, Chirakchi, and Guzar. As to the eastern portion, it is covered with high mountains and plateaus.

The Hissar range, which separates the Zerafshan from the large tributaries of the Amu—the Surkhan, Kafirnagan, and Waksh (Surkhab)—is generally represented as running west to east, and ending in the west by the group Hazret-sultan; but it may perhaps be continued in reality to the south-west, ending in the Haja Mahmud mountains. In the east it is continued by the Alai mountains. Its length is about 200 miles, and its passes, lying from 1000 to 3000 feet below the surrounding peaks, are at altitudes of from 12,000 to 14,000 feet. The highest peaks are at the headwaters of the Yagnob (Great and Small Barzenghi, Rostovtseff's pass), where large glaciers are found. Numerous spurs run from it to the south and south-west, and there seems to exist a parallel range, Zigdi. Granites, gneisses, diabases, various porphyries, as also mica, clay, and silica, slates, limestones, conglomerates, and sandstones, enter into its composition. Numbers of rivers pierce or flow in wild gorges between its spurs. Its southern foot-hills, covered with loess, make the fertile valleys of Hissar and the Vaksh. The climate is so dry, and the rains are so scarce, that an absence of forests and Alpine meadows is characteristic of the ridge; but when great rain comes during the melting of the snow in the mountains, the devastations of the torrents are terrible. The main glaciers (12) are on the north slope, at the sources of the Yagnob and the Namrut; but none of them creeps below the 10,000 to 12,000 feet level. The passes across this ridge are extremely difficult.

The Peter the Great range, or Periokh-tau, in Karateghin, south of the valley of the Vaksh, runs west-south-west to east-north-east for about 130 miles, and is still higher. It is pierced in its south-west part by the Obi-khingou. From the meridian of Garm it rises above the snow-line, attaining at least 18,000 feet in the Sary-kaudal peak, and 20,000 feet farther east where it joins the snow-clad Darvaz range, and where the group Sandal, adorned

with several glaciers, rises to 24,000 or 25,000 feet. Only three passes, very difficult, are known through it.

The bekdom of Darvaz, vassal to Bokhara, is situated on both sides of the Panj, near its sharp bend westwards, and is limited in the south by the Badakshan (Pamir), and on the west by Baljuran and Kulab, both belonging to Bokhara. It is covered with high mountains, and only in the lower parts of the valleys is agriculture possible. The population, about 35,000, consists chiefly of Moslem Tajiks (Galcha), and its chief town is at Kala-i-khum on the Panj, at an altitude of 4370 feet. Finally, the Roshan, another bekdom vassal to Bokhara, is on the Pamir. Its population (also Tajiks) is estimated at 5000 families, and its chief town is Kala-i-Vamar, at the junction of the Murghab with the Panj.

The chief river of the khanate is the Amu, which waters its eastern portion, and flows along its south-west border, attaining at the spot where it is spanned by the railway bridge the width of $1\frac{1}{2}$ mile; it is navigated from the mouth of the Surkhan, and steamboats ply on it up to Kerki. Of its tributaries, the Zerafshan, the water of which is largely utilized for irrigation (43 main canals, having an aggregate length of 660 miles, are drawn from it), is lost in the sands 20 miles before reaching the Amu. Of the other right-bank tributaries of the Amu—the Surkhan, Kafirnagan, Vaksh, Aksu, &c.—only the first-named is navigated to some extent. Finally, the Kashka-daria, which flows westwards out of the glaciers of Hazret-sultan, supplies the Shahri-sabs (properly Shaar-sabiz) oasis with water, but is lost in the desert to the west of Karshi.

The climate of Bokhara is extreme. In the lowlands a very hot summer is followed by a short but cold winter, during which a frost of -20° Fahr. may set in, and the Amu may freeze for a couple of weeks. In the highlands this hot and dry summer is followed by four months of winter; and, finally, in the regions above the 8000-foot level, one sees a great development of snow-fields and glaciers; the passes are buried under snow, and the short summer is rainy. The lowlands are sometimes visited by terrible sandstorms from the west, which exhaust men and kill the cotton trees. Malaria is widely spread, and in some years, after a wet spring, takes a malignant character.

The population is estimated at from 2,000,000 to perhaps 2,500,000. About 300,000 live on the lower Zerafshan, 500,000 in the Shaar-sabiz and its neighbourhood; 200,000 in the Hissar region, and about 500,000 on the Amu. Another 500,000 may be scattered in the highlands. The population is of both Turkish and Iranian origin. The dominant nationality are the Uzbeks, who are fanatic Moslem Sunnites, despise work and their Iranian subjects, and maintain their old division into tribes or kins. The Turkomans (chiefly Ersaris) and the Kirghiz are also of Turkish origin; while the Sarts, who constitute the bulk of the population in towns, are a mixture of Turks with Iranians. The great bulk of the population in the country is composed of Iranian Tajiks, who are Sunnites by name and Shiites in reality. Afghans, Persians, Jews, Arabs, Armenians, &c., must be added to the above. Nearly 20 per cent. of the population are nomads and about 15 per cent. half-nomads.

On the irrigated lowlands rice, wheat, and other corn are grown, sufficient to be exported to the highlands, and only a small quantity is imported from Russian Turkestan. Cotton is widely grown and exported (500,000 cwts.). The silk-worm culture is, however, of late years in decay. Cattle-breeding is widely spread in Hissar and the highlands generally. Cotton, silks, woollen cloth, and felt are largely fabricated, also boots, saddles, hardware, pottery, and various oils. Salt, as also some iron and copper, and small quantities of gold are extracted. The internal and the external trade are both very animated. The exports to Russia (raw cotton, raw silk, lamb-skins, carpets, &c.) attain the value of £1,200,000, and the imports of manufactured goods, sugar, &c., attain £1,000,000. The imports from India (cottons, tea, shawls, indigo) reach £550,000, and from Persia about £50,000, while the exports are £50,000 and £200,000 respectively. There are very few roads in Bokhara, the goods being transported on camels, or on horses and donkeys in the hilly tracts. The main caravan roads radiate from Bokhara to Baljuran, *viâ* Karshi, Guzar, and Hissar; to Balkh; to Meimene, *viâ* Kerki; and to Samarkand, *viâ* Jam. The Transcaspian railway crosses the khanate on a length of 268 miles.

The emir of Bokhara is an autocratic ruler who governs according to the laws of the *Shariat* (common law). His troops consist of a regular army and a militia, to which the general militia (*hazarvat*) must be added in time of war. There are 14,000 infantry, 14,000 cavalry, and 20 guns. The chief towns of the khanate are:—Bokhara, Karshi (about 35,000 inhabitants), and Charjui. (P. A. K.)

Bokhara (*Bokhara-i-sherif*), capital of the above khanate, is situated on the left bank of the Zerafshan, on the irrigation canal Shahri-rud, in a fertile plain dotted with villages. It is 8 miles from the Bokhara station of

the Transcaspian railway, 155 miles by rail W. of Samarkand, $39^{\circ} 47'$ N. lat. and $64^{\circ} 27'$ E. long.; alt. 640 feet. The city is surrounded by a stone wall 28 feet high and 8 miles long, having 131 half-circular towers and 11 gates of little value as a defence. It was begun in 830, destroyed by Chenghiz-khan, and rebuilt subsequently. The water-supply is very unhealthy. The city has no less than 360 mosques and as many streets, nearly 40 caravan-serais, and 50 market-places. Nearly 10,000 pupils receive education in its 103 medresses; primary schools (*maktebs*) are kept at most mosques. Of its numerous squares the Raghistan is the principal. It has on one side the citadel erected on an artificially made eminence about 40 feet high, surrounded by a wall one mile long, and containing the palace of the emir, the houses of the chief functionaries, the prison, and the water-cisterns. The houses are mostly one-storeyed and built in unburned bricks. Some of the medresses and mosques are of a very fine architecture. Of the former the most notable is the Mir-arab-i-Zariryan, with its beautiful lecture-halls; the chief mosque of the emir is the Méjidi-kalyan, or Kok-humbez, close by which stands the brick minaret, 203 feet high, from the top of which the state criminals used to be thrown up to 1871.

From a remote antiquity Bokhara was a centre of pagan learning and worship. It retained the same position when it became Mussulman, only having a rival in Samarkand, under Timur. And while other cities, like Balkh, Merv, and Samarkand, lost their educational and religious importance with the fall of their political power, Bokhara has fully retained it up till now. The Bokhara learned Mussulmans took a lively part in the collection of the holy traditions about the prophet, and later in the compilation of the books which systematized his teachings. The mysticism which took hold on Persia in the Middle Ages, also spread at Bokhara, and later, when the Mongol invasions laid waste Samarkand and other Moslem cities, Bokhara, remaining independent, continued to be the seat of learning. It is still the main stronghold of Islam and a centre of Mussulman learning for all the Russian dominions. Its book-market is small, and contains nothing but the current text-books, written, lithographed, or printed in India, Persia, or Kazan; the medresse libraries, too, some of which were very rich, have been scattered and lost, or confiscated by emirs, or have perished in conflagrations. But there are still treasures of literature concealed in private libraries, and Afghan, Persian, Armenian, and Turkish bibliophiles come continually to Bokhara to buy rare historical, geographical, medical and other books. Besides, owing to the custom existing among learned men to bequeath their libraries to the emir, his library is said to be very rich. As a whole, Bokhara is thus the chief book-market of Central Asia. The population is estimated variously, but is supposed by Russian travellers not to exceed 50,000 or 60,000. For its trade, interior and exterior, Bokhara is the chief city of all Central Asia.

New Bokhara, or *Russian Bokhara*, a Russian town near the railway station, is rapidly growing on a territory conceded by the emir. Population, 2000. (P. A. K.)

Bolgrad, a town of South Russia, government of Bessarabia, district and 30 miles E. of Izmail. It was founded at the beginning of the 19th century as a colony of Bulgarians. It has now a population of 12,390, gymnasia for boys and for girls, and is a depot for trade in corn.

Boli, the chief town of a sanjak of the Kastamûni vilâyet in Asia Minor, altitude 2500 feet, situated in a rich plain watered by the Boli Su, a tributary of the Filiyas Chai (*Billaus*). Three miles east of Boli, at Eski-hissar, are the ruins of *Bithynium*, the birthplace of Antinous, also called *Antinoopolis*, and *Claudiopolis*. At Ilija, south of the town, are warm springs much prized for their medicinal properties. Population, 10,800 (Moslems, 9600; Christians, 1200).

Bolivar, a department of the republic of Colombia, bounded on the N. by the Caribbean Sea, on the S. by the department of Antioquia, on the E. by Magdalena and Santander, and on the W. by Cauca and the Caribbean Sea. Area, 27,000 square miles. Population, 325,000,

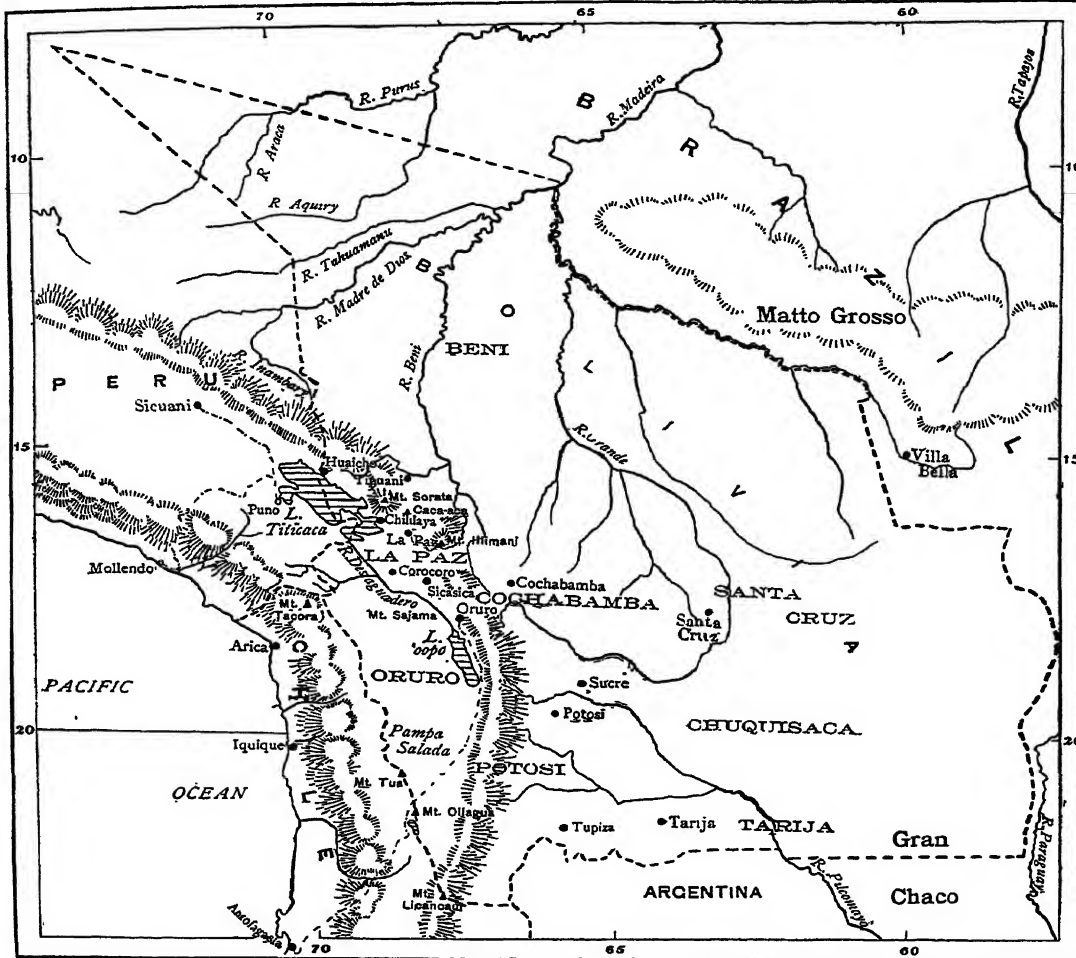

mostly white. The capital, Cartagena, has 11,000 inhabitants, and the principal towns include Mompox, Chinu, Sabanalarga, Barranquilla, at the mouth of the Magdalena, Soledad, Magangue, Corozal.

Bolivia, a country of South America extending from 10° to 23° S. lat., and from 58° to 70° W. long., bounded on the N. by Brazil, on the E. by Brazil and Paraguay, on the S. by the Argentine Republic, and on the W. by Chile and Peru. In the course of the war of 1879-83 with Chile, Bolivia lost her maritime provinces, and by the treaty of 4th April 1884 agreed

Inambari to its confluence with the Madre de Dios, whence it runs in a straight line to the sources of the Yavary in 7° 1' 17" S. lat., there uniting with the Brazilian frontier, decided by treaty of 1867. The frontier towards Paraguay is still under dispute. An unratified treaty of 23rd November 1894 places the boundary in a straight line drawn due west across the Gran Chaco from a point on the Paraguay river, three leagues north of Puerto Olimpo, to a point where the principal channel of the Pilcomayo is intersected by the meridian of 61° 28" W. long.

Mountains.—The mountains of Bolivia may be boldly grouped

into two main divisions, the western and the eastern Cordilleras. The western Cordillera consists of two or more parallel and associated ranges, whereof the lowest or Coast Cordillera does not exceed 5000 feet in altitude. Farther inland the mountains are higher till the main western Cordillera, to which some would confine the name Andes, is reached. This is a volcanic range, averaging about 15,000 feet in height, and contains some volcanoes not yet extinct. Mount Sajama is its highest measured peak (21,044 feet, Pissis; 21,559 feet, Reck). The eastern Cordillera or Cordillera Real branches from the western or Cordillera de los Andes about 24° S. lat. and making a bend to the east reunites with that range in 14° 40' S. lat. Its three chief peaks are Mount Sorata, culminating in two peaks, Ancochuma or Hankuma (21,286 feet, Pentland; 21,710 feet, Conway), and Illampu (200 feet lower than Ancochuma); Caca-aca, wrongly called Huaina Potosi (20,170 feet, Minchin; 20,560 feet, Conway); and Illimani (21,355 feet, Pissis; 21,015, Conway). Between Mount Sorata in the north and Illimani in the south, a distance of about 64 miles, this range is almost continuously snow-clad and bears a number of large glaciers, though south of Caca-aca are several broad depressions below the snow-level. The mean summer snow-line lies at about 17,000 feet. The range is cut through south of Illimani by the

SKETCH MAP OF BOLIVIA.

provisionally to a new boundary. According to this treaty, the western frontier of Bolivia, starting from Sapalegui, the point where the Chilean, Argentine, and Bolivian boundaries meet, runs in a straight line to the Licancaur volcano, and thence straight to the southern source of the waters of Lake Ascotan, whence in another straight line it passes lengthwise over the lake and is continued to Ollagua volcano, from which it goes direct to Tua volcano, and joins the recognized eastern boundary of the department of Tarapaca. A preliminary treaty of 10th April 1886 provides rules for the demarcation of the frontier towards Peru. The *de facto* boundary runs from Tacora mountain across the sources of the Maure to Lake Titicaca; crosses the lake from the point of outflow of the Desaguadero to Huaicho on the northern side, runs to the sources of the valley of the San Juan del Oro, passes down the valley and down the

valley of the La Paz, and north of Mount Sorata by the Mapiri, both rivers draining portions of the west slope of the range. Across the high part of the range between these valleys are several passes traversed by mule-paths or over which mule-paths could be easily made. Between the two main ranges lies the high plateau, a plain at an average altitude of about 12,500 feet. Various minor hills, called Serrania, rise out of this plain. It also includes Lakes Titicaca and Poopó, and the Rio Desaguadero which connects them. Eastwards the Cordillera Real falls rapidly to a mean level, of about 3000 feet, which slopes away to the great central continental plain. The rapidly falling eastern slope is cut up into deep valleys or quebradas, called las Yungas, which are richly forested and include areas of great fertility. In the south the extension of the Argentine railway system to Jujuy has opened up the country, but the Beni district is still shut out from easy eastward communication by the rapids of the Madeira. But an almost level road might easily be cut through the forest from the navigable upper part of the Madre de Dios to the Rio Aquiry, in about 69° W. long., whereby the cataracts would be avoided. The rivers could also be united by a canal.

Climate.—The high plateau is subject to a rainy season which

begins in November or December and continues till April or May. During this time immense quantities of snow fall on the high mountains and violent thunderstorms rage over the Puna. In the winter months, May, June, and July, the weather is of almost unbroken clearness with strong cold winds. In August, September, and October the weather begins to break and showers fall occasionally. The eastern valleys near the mountains share in this succession of seasons to a less marked degree.

Geology.—The best account of the geology of Bolivia is that of Mr David Forbes (*Quarterly Journal of the Geological Society*, February 1861). The mass of the Cordillera Real consists of granite, diorite, and crystalline schists, with Silurian and Devonian rocks farther west. Small basin-shaped Carboniferous deposits appear at intervals farther west from Titicaca to Oruro and in the department of Santa Cruz. The Permian formation comes next to the west, and is largely developed and very rich in mineral deposits. The coast region is formed of deposits belonging to the Upper Oolitic system. The chief region of volcanic activity is the line of the western Cordillera, though a bed of trachytic tuff is found near La Paz, and some andesite has been observed on the flank of Illimani. The high plateau is covered by recent alluvial deposits, 1500 feet thick near La Paz, which mark the site of a great inland sea, whereof Titicaca and Poopó are the disappearing remnants. It is probable that the whole of the high region of Bolivia has risen in recent geological times, and it is perhaps still rising.

Area and Population.—The area of Bolivia (exclusive of the maritime provinces and Atacama) extends to 734,340 square miles. No complete census of the republic has ever been carried out, but the population is officially estimated at 2,313,750. The area and population of the eight departments, and of the two territories of the republic are given as follows:—

Departments and Territories.	Area. Square miles.	Population.	Population, per square mile.
Chuquisaca . . .	39,870	250,000	6
La Paz . . .	171,080	573,750	3
Cochabamba . . .	21,420	485,900	23
Potosi . . .	52,090	365,500	7
Oruro . . .	21,330	230,600	11
Tarija . . .	34,600	94,900	3
Santa Cruz . . .	87,700	210,800	2
Beni . . .	100,550	38,700	...
Madre de Dios, Ter.	13,500	18,600	1
Purus, Ter. . .	192,200	45,000	...
Total . . .	734,340	2,313,750	3

Of the population 79,000 are whites and 299,500 of mixed European and Indian blood. The rest of the inhabitants are Indians, most of whom are semi-civilized, the number of uncivilized being estimated at over 240,000. The principal towns of Bolivia are La Paz, the capital, with 62,000 inhabitants; Cochabamba, 29,500; Sucre, 27,000; Potosi, 16,000; Oruro, 15,000; Santa Cruz, 12,000; Tarija, 12,000. Formerly the seat of government passed in rotation to each of four towns; in 1898 a law was passed making Sucre perpetual capital; La Paz protested, claiming the dignity for itself, and, after a brief war and a change of government, prevailed.

According to the constitution established by a National Convention in 1880, Bolivia is a republic, with a representative and democratic form of government.

Government. The legislative power resides in a National Congress of two chambers, one of senators,

the other of deputies. The Senate consists of sixteen members (two for each department) chosen for six years, of whom one-third retire every two years. Senators must be at least thirty-five years of age, and have an annual income of not less than 800 bolivianos. The Chamber of Deputies contains sixty-nine members chosen for four years, of whom one-half are removable every two years. Deputies must be at least twenty-five years of age, and have an annual income of not less than 400 bolivianos. Both senators and deputies are elected by direct suffrage, but electors must possess real property, or an annual income of not less than 200 bolivianos. Congress meets annually on 6th August for a session of at least sixty days. The executive power is vested in a president chosen for four years by direct and secret popular vote. He is not eligible for the succeeding presidential term. He has power to make treaties, subject to ratification by Congress; he is at the head of the military forces; may convoke Congress for extraordinary sessions; and has rights of

patronage both in Church and State. He is assisted by two vice-presidents elected in the same manner and for the same period, and by a cabinet of five ministers appointed by himself as heads of departments of government. These ministries are—foreign affairs and worship, government and fomento, finance and industry, justice and public instruction, war and colonization.

Local Government.—At the head of each of the eight departments into which Bolivia is divided is a prefect appointed by the president and removable at his pleasure. The provinces are governed by sub-prefects, the cantons by justices (*corregidores*), and the country districts by *alcaldes*. The capital of each department has a municipal council; there are administrative boards in the provincial capitals, and cantonal agents in the villages. The duties of the municipal authorities relate to public works, municipal taxation, instruction, police, charity, and other matters. The two territories formed in 1890 are controlled by officials called national delegates.

Justice.—Justice is administered by a supreme court in the capital, by district courts in the departmental capitals, and by inferior tribunals of several grades.

Education.—Primary instruction is gratuitous and obligatory, and is under the care of the municipal authorities. In 1899 there were 692 primary schools, with 1020 teachers and 36,418 pupils. Among these are included about seventy schools for rural Indians taught by parish priests, and about 140 mission schools. The sum spent annually by the municipalities on primary education amounts to 140,000 bolivianos (£12,720). Secondary education is given in eight colleges, four seminaries, one religious college, and four private *lycées*. In 1899 there were 115 secondary teachers and 2321 pupils. At Sucre and La Paz there are schools of arts and trades conducted by the Salesian friars; at Sucre there is, besides, a commercial school, and at La Paz a military college. Higher education is given in six universities, at four of which medical science is taught. In 1898 the number of students was 2221. The theological faculty, including the seminaries, had 110 students in 1899.

Defence.—By laws of 1875 and 1880, every Bolivian citizen fit for service is a soldier, and is required to serve under the colours for two years, but the clergy are exempt, as are also certain others for special reasons. The military force consists of (a) troops of the line, numbering, in 1899, 2560, organized in two battalions of infantry, two regiments of cavalry, two regiments of artillery, and garrison troops distributed among the departments; (b) the reserves, composed of depot corps, with 30,000 men from twenty to twenty-five years of age; the ordinary and the extraordinary reserve, with 40,000 men from twenty-five to forty years of age; and the territorial guard, with 10,000 men from forty to fifty years of age. The total combatant force thus amounts to 82,560.

Finance.—The public revenues collected within the republic are divided into national, departmental, and municipal. The first and second are applied to the ordinary expenses of government; the third, to those of the municipalities. The national revenue is derived mainly from customs, monopolies, and taxes on the production and export of minerals and of rubber, while the departmental revenues are mainly the proceeds of taxes on land, paid by natives, on inheritances and legacies, on deeds, and on cattle imports and exports. The expenditure passes through the various government ministries. The national and departmental revenues for 1895-99, officially stated in silver bolivianos, are given in the sub-joined table converted into sterling at the rate of eleven bolivianos to the £. No corresponding statement of expenditure is accessible.

Years.	Revenue.	
	National.	Departmental.
1895	£374,120	£135,140
1896	430,870	142,320
1897	505,800	154,220
1898	472,180	154,220
1899	539,910	159,510

For 1900 the national revenue and expenditure (at the same rate of exchange) were estimated as follows:—

Sources of Revenue.	Revenue.	Branches of Expenditure.	Expenditure.
Customs . . .	£335,420	Legislative . . .	£15,000
Spirit monopolies . . .	138,170	Foreign affairs, &c.	57,580
Silver . . .	54,540	Government, &c. .	127,800
Rubber . . .	45,450	Finance, &c. .	242,990
Tin, copper, bis- muth . . .	23,630	Justice, instruc- tion . . .	86,640
Various . . .	69,210	War, colonization	241,350
Total . . .	£666,420	Total . . .	£720,860

For 1900 the total departmental revenue was estimated at £179,540, and the total municipal at £140,960. The internal debt recognized by the State amounted in 1899 to 3,934,250 bolivianos (£356,620). This amount included accumulated deficits, 1,564,226 bolivianos (£142,190), and war loans, 763,390 bolivianos (£69,390). The external debt, which originally amounted to 6,550,830 bolivianos, was due to Chileans as indemnity for their losses in the war of 1879-83. At the end of 1899 the outstanding amount was 881,910 bolivianos (£80,170).

Agriculture.—The most important vegetable product of Bolivia is rubber, which grows abundantly in the region of the upper Tahuamanu river, in the territories of Madre de Dios and Purus, in the department of La Paz, and in the region bordering on the Brazilian state of Matto Grosso. The trees are the property of the State, and any person, citizen or foreigner, may collect the gum without license, but the discoverer of trees may, by applying for a concession, obtain exclusive right to the advantages of his discovery. The total quantity of rubber which passed through the ports of Puerto Perez, Villa Bella, and Puerto Suarez in 1890 was 646,800 lb; in 1895, 1,804,900 lb; and in 1898, 6,943,100 lb. The rubber exported through Mollendo is known as "Mollendo rubber," while that sent eastwards to Brazil becomes "Para rubber." Another product which has risen into importance is coca, from which cocaine is obtained. The annual production of coca is stated to reach 10,120,000 lb, three-fourths of which grows in the province of Yungas, in the department of La Paz. In coca extraction duties the government collects about 250,000 bolivianos (£22,725) annually. Cinchona is exported in small quantities. Coffee, cocoa, and tobacco are cultivated, but are not commercially important. Besides the vicuña, llama, and alpaca, the country contains many cattle, and the cattle imports and exports are considerable. The use of llamas as beasts of burden is much less common than formerly, though flocks of them are still frequently met with on the roads. Donkeys and mules have taken their place. Some of the finest chinchilla skins come from Bolivia.

Minerals.—The country is rich in mineral wealth, much of which is still undeveloped. Gold is found in the gravels of most of the eastern valleys descending from the high part of the Cordillera Real, as well as in the La Paz valley and its upper eastern branches. Auriferous quartz is worked in the Araca valley and elsewhere. The most important gold-mining enterprises are those of two companies in the neighbourhood of La Paz, and one in the province of Cercado in the same department. For the working of the hydraulic mines of Tipuani there are five English and four French companies. Silver-mining in the Oruro district has been greatly developed, and a great quantity of the metal has been extracted from the important mines of Pulacayo (now full of water) and Oruro. Copper is now extensively mined at Corocoro. Tin is worked near Oruro, where large quantities of very rich ore exist, and on the west flank of Caca-aca in the hill called Huaina Potosi. In the tin districts bismuth is produced in increasing quantities. Coal exists on an island in Lake Titicaca, and an attempt is being made to work it. Most of the nitrate fields and guano beds once Bolivian are in areas now held by Chile. The following table presents a view of the metal output during 1895-99. The quantities of gold and silver are stated in troy ounces; those of copper, tin, and bismuth are given in tons, Spanish quintals being taken as equivalent to 101·6 lb av. The quantities of copper are only those obtained at Corocoro.

Years.	Gold.	Silver.	Copper.	Tin.	Bismuth.
	Oz.	Oz.	Tons.	Tons.	Tons.
1895	14,467	21,508,350	2487	1407	142
1896	16,075	21,058,250	3370	1360	131
1897	22,023	21,935,560	2748	2705	181
1898	17,682	10,999,800	3370	3692	272
1899	17,554	10,042,575	...	5192	453

Antimony, borate of lime, lead, and other minerals are produced and exported in small quantities. Apart from the working of mines and the exploitation of rubber, the industries of Bolivia are of little account. The more important of them are distilling, brewing, and the preparation of wines; the weaving of vicuña and alpaca coverlets; the manufacture of sugar, sweets, chocolate, and cigarettes.

Commerce.—The value of the imports and exports in 1895-99 was as follows (conversions being made at the uniform rate of 11 bolivianos to the £):—

Years.	Imports.	Exports.
	£	£
1895	1,263,270	1,901,100
1896	1,177,380	2,004,100
1897	1,132,360	1,998,930
1898	1,081,460	2,495,810
1899	1,167,150	2,487,550

In 1899 the imports consisted almost entirely of articles for personal or domestic use or consumption, such as cotton and woollen goods, food-stuffs and beverages, furniture and hardware, while mineral and agricultural products were exported. The mineral exports reached the value of £1,616,400, the most important having been silver, £909,000 (10,000,000 bolivianos); tin, £454,500; bismuth, £85,450; and copper, £72,720. The agricultural exports amounted to the value of £792,540, the rubber exports alone being valued at £727,200. Of the imports 16 per cent. in value came from Germany, 12 per cent. from Chile, 9 per cent. from Great Britain, from France, and from the United States, and 8 per cent. from Peru. Of the exports, 44 per cent. in value went to Great Britain, 34 per cent. to Germany, 7 per cent. to France, 3 per cent. to Chile, to Peru, and to the United States. Bolivia having no seaport, its trade on the side towards the Pacific passes through the ports of Mollendo, Arica, and Antofagasta, at all of which there are Bolivian customs agencies. On the eastern side large quantities of rubber are exported from Villa Bella and Puerto Suarez, and towards the Argentine Republic there is a growing export trade through Tupiza. Of the imports in 1899, 57 per cent. in value passed through Antofagasta, 19 per cent. through Mollendo, 16 per cent. through Arica, 6 per cent. through Puerto Suarez and Villa Bella together. Of the exports, 61 per cent. passed through Antofagasta, 5 per cent. through Mollendo, 1 per cent. through Arica, 21 per cent. through Puerto Suarez and Villa Bella together, and 3 per cent. through Tupiza.

Roads—Road, River, Rail.—Bolivia is provided with a vast system of natural highways in its lakes and rivers—Lake Titicaca, with an area of 3880 square miles, being connected by the Desaguadero river with Lake Poopó, covering 2800 square miles, while throughout the country the length of rivers navigable for steam launches is estimated at 5600 miles. The national roads which traverse the republic are made and maintained by the government. Those in the upper Andes were, at great expense, constructed by Indian labour, and serve for transport by means of pack animals. The roads which connect the principal cities with neighbouring towns are in general constructed by the municipalities. The nature of the country makes road-making difficult and costly. A reasonably good carriage-road connects the port of Chililaya, on Lake Titicaca, with La Paz, Corocoro, Sicasica, and Oruro. Branch roads run eastward to Cochabamba and Potosi, whilst the last-mentioned towns are connected with Sucre and one another by carriage-roads. The Tacna road has ceased to be an important commercial route. The only railway that actually enters Bolivia is a narrow-gauge line from the Chilean port of Antofagasta to Oruro. It is 574 miles in length, and attains an altitude of 13,580 feet. The northern part of the country is most easily reached from Mollendo by the railway to Puno on Lake Titicaca (325 miles; highest point, 14,666 feet), whence three steamboats ply to the Bolivian port of Chililaya, about 40 miles from La Paz. Other railways have been projected.

Post and Telegraph.—Bolivia joined the Postal Union in 1885. In the country there are 328 post-offices, and, in 1898, 899,080 pieces of mail matter were received, while 747,633 were despatched. The telegraph lines within the republic have a length of 2250 miles, and are served by 35 telegraph and 2 telephone offices. The telegraph lines belonging to the State have a length of 1240 miles.

Banks.—In 1900 there were in Bolivia 4 banks of issue: the National Bank, founded at Sucre in 1871, with a paid-up capital of 3,000,000 bolivianos (or, at the rate of exchange adopted for this article, £272,700); Argandoña's Bank, founded at Sucre in 1893, with a paid-up capital of 2,000,000 bolivianos (£181,800); the Industrial Bank at La Paz (1899), and the Commercial Bank at Oruro (1900), the two last named having each a paid-up capital of 500,000 bolivianos (£45,450). There are also 3 mortgage banks with paid-up capital amounting in all to 285,587 bolivianos (£25,960), and a savings bank, founded in 1900. The bank notes in circulation amount to 6,482,000 bolivianos (all of the National and Argandoña Banks), and, notwithstanding the large production of silver, there is great scarcity of silver coin. The metal not at once exported as bullion is minted and leaves the country as coin. The money coined and put in circulation during 1895-99 amounted to 7,981,760 bolivianos, showing an annual average of 1,586,352 bolivianos.

The boliviano, the unit of account, is of silver, and weighs 25 grams, or 385·8 grains, ·900 fine. The value at par is 5 francs, but in July 1900 its actual value was 1s. 9·9d. (or 43·8 United States cents.). The metric system of weights and measures is prescribed by law, but the old Spanish system is still in use.

Recent History.—In January 1871 President Melgarejo was deposed and driven from the country by a revolution headed by Colonel Augustin Morales. The latter, becoming president, was himself murdered in November 1872 and was succeeded by Colonel Adolfo Ballivian, who died in 1874. Under this president, Bolivia entered upon a secret agreement with Peru which was destined to have grave consequences for both countries. To understand the reasons that urged Bolivia to take this step it is necessary to go back to the year 1866, when Chile and Bolivia were allied against Spain. A treaty was then concluded between those two republics, by which Bolivia conceded the 24th parallel as the boundary of Chilean territory and agreed that Chile should have a half share of the customs and full facilities for trading on the coast that lay between the 23rd and 24th parallels, Chile at that time being largely interested in the trade of that region. It was also agreed that Chile should be allowed to mine and export the products of this district without tax or hindrance on the part of Bolivia. In 1870, in further consideration of the sum of \$10,000, Bolivia granted to an Anglo-Chilian company the right of working certain nitrate deposits north of the 24th parallel. The great wealth which was passing into Chilean hands owing to these compacts created no little discontent in Bolivia, nor was Peru any better pleased with the hold that Chilean capital was establishing in the rich district of Tarapacá. On 6th February 1873 Bolivia entered upon a secret agreement with Peru, the ostensible object of which was the preservation of their territorial integrity and their mutual defence against exterior aggression. There can be no doubt that the aggression contemplated as possible by both countries was a further encroachment on the part of Chile.

Upon the death of Adolfo Ballivian, immediately after the conclusion of this treaty with Peru, Dr Tomas Frias succeeded to the presidency. He signed yet another treaty with Chile, by which the latter agreed to withdraw her claim to half the duties levied in Bolivian ports on condition that all Chilean industries established in Bolivian territory should be free from duty for twenty-five years. This treaty was never ratified, and four years later General Hilarión Daza, who had succeeded Dr Frias as president in 1876, demanded as the price of Bolivia's consent that a tax of 10 cents per quintal should be paid on all nitrates exported from the country, further declaring that, unless this levy was paid, nitrates in the hands of the exporters would be seized by the Bolivian Government. As an answer to these demands, and in order to protect the property of Chilean subjects, the Chilean fleet was sent to blockade the ports of Antofagasta, Cobija, and Tacapilla. On 14th February 1879 the Chilean Colonel Sotomayor occupied Antofagasta, and on 1st March, a fortnight later, the Bolivian Government declared war.

An offer on the part of Peru to act as mediator met with no favour from Chile. The existence of the secret treaty, well known to the Chilean Government, rendered the intervention of Peru more than questionable, and the law passed by the latter in 1875, which practically created a monopoly of the Tarapacá nitrate beds to the serious prejudice of Chilean enterprise, offered no guarantee of her good faith. Chile replied by curtly demanding the annulment of the secret treaty and an assurance of Peruvian neutrality. Both demands being refused, she declared war upon Peru.

The superiority of the Chileans at sea, though checked for some time by the heroic gallantry of the Peruvians, soon enabled them to land a sufficient number of troops to meet the allied forces which had concentrated at Arica and other points in the south. The Bolivian ports were already in Chilean hands, and a sea attack

upon Pisagua surprised and routed the troops under the Peruvian General Buendia and opened the way into the southern territory of Peru. General Daza, who should have co-operated with Buendia, turned back, on receiving news of the Peruvian defeat, and led the Bolivian troops to Tacna in a hasty and somewhat disorderly retreat. The fall of San Francisco followed, and Iquique, which was evacuated by the allies without a struggle, was occupied. Severe fighting took place before Tarapacá surrendered, but the end of 1879 saw the Chileans in complete possession of the province.

Meanwhile a double revolution took place in Peru and Bolivia. In the former country General Prado was deposed and Colonel Pierola proclaimed dictator. The Bolivians followed the example of their allies. The troops at Tacna, indignant at the inglorious part they had been condemned to play by the incompetence or cowardice of their president, deprived him of their command and elected Colonel Camacho to lead them. At the same time a revolution in La Paz proclaimed General Narciso Campero president, and he was elected to that post in the following June by the ordinary procedure of the constitution. During 1880 the war was chiefly maintained at sea between Chile and Peru, Bolivia taking little or no part in the struggle. In January of 1881 were fought the battles of Chorrillos and Miraflores, attended by heavy slaughter and savage excesses on the part of the Chilean troops. They were followed almost immediately by the surrender of Lima and Callao, which left the Chileans practically masters of Peru. In the interior, however, where the Peruvian Admiral Montero had formed a provisional government, the war still lingered, and in September 1882 a conference took place between the latter and President Campero, at which it was decided that they should hold out for better terms. But the Peruvians wearied of the useless struggle. On 20th October 1883 they concluded a treaty of peace with Chile; the troops at Arequipa, under Admiral Montero, surrendered that town, and Montero himself, coldly received in Bolivia, whither he had fled for refuge, withdrew from the country to Europe. On the 9th of November the Chilean army of occupation was concentrated at Arequipa, while what remained of the Bolivian army lay at Oruro. Negotiations were opened, and on 11th December a peace was signed between Chile and Bolivia. By this treaty Bolivia ceded to Chile the whole of its sea-coast, including the port of Cobija.

On 18th May 1895 a treaty was signed at Santiago between Chile and Bolivia, "with a view to strengthening the bonds of friendship which unite the two countries," and, "in accord with the higher necessity that the future development and commercial prosperity of Bolivia require her free access to the sea." By this treaty Chile declared that if, in consequence of the plebiscite (to take place under the treaty of Ancon with Peru), or by virtue of direct arrangement, she should "acquire dominion and permanent sovereignty over the territories of Tacna and Arica, she undertakes to transfer them to Bolivia in the same form and to the same extent as she may acquire them"; the republic of Bolivia paying as an indemnity for that transfer \$5,000,000 silver. If this cession should be effected, Chile should advance her own frontier north of Camerones to Vitor, from the sea up to the frontier which actually separates that district from Bolivia. Chile also pledged herself to use her utmost endeavour, either separately or jointly with Bolivia, to obtain possession of Tacna and Arica. If she failed, she bound herself to cede to Bolivia the roadstead (*caleta*) of Vitor, or another analogous one, and \$5,000,000 silver. Supplementary protocols to this treaty stipulated that the port to be ceded must "fully satisfy the present and future requirements" of the commerce of Bolivia.

On 23rd May 1895 further treaties of peace and commerce were signed with Chile, but the provisions with regard to the cession of a seaport to Bolivia still remained unfulfilled. During those ten years of recovery on the part of Bolivia from the effects of the war, the presidency was held by Dr Pacheco, who succeeded Campero, and held office for the full term; by Dr Aniceto Arce, who held it until 1892, and by Dr Mariano Baptista, his successor. In 1896 Dr Severo Alonso became president, and during his tenure of office diplomatic relations were resumed with Great Britain, Señor Aramayo being sent to London as minister plenipotentiary in July 1897. As an outcome of his mission an extradition treaty was concluded with Great Britain in March 1898.

In December an attempt was made to pass a law creating Sucre the perpetual capital of the republic. Until this Sucre had taken its turn with La Paz, Cochabamba, and Oruro. La Paz rose in open revolt. On 17th January of the following year a battle was fought some forty miles from La Paz between the insurgents and the Government forces, in which the latter were defeated with the loss of a colonel and forty-three men. Colonel Pando, the insurgent leader, having gained a strong following, marched upon Oruro, and entered that town on 11th April 1899, after completely defeating the Government troops. Dr Severo Alonso took refuge in Chilean territory; and on 26th October Colonel Pando was elected constitutional president and formed a government.

Peace and prosperity for Bolivia, as well as for the two republics with whose fortunes her own are so closely allied, depend mainly

on the question of her seaboard, in which Chile and Peru are also concerned, being definitely settled and, with it, the question of boundary. In October 1901 Tacna and Arica had not yet been invited to declare by plebiscite their willingness to become Chilean territory. Chile still waited the final settlement of her frontier with Peru, and Bolivia was still without her seaport. The feeling of suspense, engendered by the uncertainty of the situation, had led to some show of impatience on the part of Chile, who seemed disposed to press for the legitimization of her position on what was formerly Bolivian territory before the way had been cleared towards providing Bolivia with a compensating access to the sea. Her impatience was said to be due to the discovery of a secret treaty, made between Bolivia and the Argentine Republic in 1891, constituting an offensive and defensive alliance between these two countries. At the close of 1901 there was no apparent obstacle to a final and peaceful settlement of the claims of Bolivia on the terms originally proposed. (W. Hb.)

Bolkhov, a district town of Russia, government and 35 miles N. of Orel, on the Oka river. It has important trade with Moscow, St Petersburg, and Little Russia, in hemp, ropes, hemp-seed oil, hemp goods, and cattle, and there are several hemp mills and important tanneries. The much-venerated monastery, Optina Pustyn, is close by. Bolkhov probably existed at the beginning of the 13th century. Population, including suburbs, 26,570.

Bollandists.—The publication of the Bollandist *Acta Sanctorum* was suspended in 1794 during the invasion of the Netherlands by the French (see *Ency. Brit.* ninth ed. vol. iv. p. 18). The continuation of the work was undertaken in 1837, on behalf of the Society of Jesus, by Jo. Bapt. Boone, Joseph. van der Moere, Prosper Coppens, and Joseph. van Hecke, of the Jesuit College of St Michael at Brussels. The programme "De prosecutione operis Bollandiani, quod *Acta Sanctorum* inscribitur" was published on 25th March 1838; and the first volume of the new series (vol. lv. of the whole work) appeared in 1845. It contained the lives of the saints for two days only, 15th and 16th October, and even these only in part. Since then additional volumes, which on the whole fully maintain the standard of scholarship of the earlier series, have appeared at intervals, the latest being vol. lxiv. This was published in 1894; and a considerable part of its bulk is taken up by a critical edition of the *Martyrologium Hieronymianum* by Jo. Bapt. de Rossi and the Abbé L. Duchesne. The scale has increased steadily with the progress of the work: the month of October occupies thirteen volumes, followed by a supplementary volume edited by L. M. Rigollot, a secular priest of the diocese of Langres; and November bids fair to attain to an even greater bulk. In addition to the writers above mentioned, many others have taken part in the work from time to time, including Benj. Bossue, Victor and Remigius de Buck, Ant. Tinnebrock, Edu. Carpentier, Henr. Matagne, Carol. de Smedt, Gulielm. van Hooff, Joseph. de Backer, Franc. van Ortoy, Joseph. van den Gheyn, Hippolytus Delehaye, and Alb. Poncelet. In 1882 de Smedt, the present director, with van Hooff and Backer, began the publication of the *Analecta Bollandiana*, in which were to appear newly discovered lives, documents and fragments, or such as were unknown when the volumes were issued to which they properly belonged: by this means, not only is there provided a means of communication between the editors and the world at large, but a supplementary collection is being formed which can be incorporated in any future revised and enlarged edition of the *Acta Sanctorum*.

A series of lives of the saints in French, known as *Les Petits Bollandistes*, was edited by Mgr Paul Guérin; it is based upon the Bollandist *Acta Sanctorum*, Surius, and other collections of the same kind (7th edition in 17 volumes, 1882). In 1899 the abbé C. Narbey of Clichy published the first volume of his *Supplément aux Acta Sanctorum pour les Vies des Saints de*

l'époque Mérovingienne. A very full *Table Alphabétique Générale des Saints*, giving references to the volumes of the Bollandist *Acta Sanctorum* so far as then published, is given in de Mas Latrie's *Trésor de Chronologie, d'Histoire et de Géographie*, cols. 665-862, Paris, 1889. (W. E. Co.)

Bologna, capital of the province of Bologna, in the compartment of Emilia, Italy, situated between the rivers Reno and Savena, 23 miles S.E. by E. of Modena by rail. It is the headquarters of the fifth Italian army corps. Since 1880 the city has undergone considerable transformation. New streets have been opened, new public and private buildings constructed, and new public gardens laid out both in the interior and the suburbs. In 1885 the municipal council sanctioned a scheme for the regularization and enlargement of the city, of which the cost to the commune alone was estimated at thirty million lire. This reform was necessitated when Bologna became in 1880 the centre of the railway communications of mid-Italy. The new streets with their colonnades retain the characteristic type of Bolognese buildings. The Giardino Marco Minghetti, near the palatial savings bank, and the monumental stairway in the Piazza Venti Settembre have been completed. In the Piazza Vittorio Emanuele the Palazzo del Podestà and other ancient buildings have been restored. Near Porta Lama a large public slaughterhouse and cattle-market have been constructed at a cost of more than 1,000,000 lire, while the Commercial Exchange, the public baths, and the customs warehouses have been added to the number of public edifices. Monuments to Victor Emmanuel II., Garibaldi, Minghetti, Cavour, Galvani, and Ugo Bassi have been erected in the various public squares. Side by side with the work of reconstruction has proceeded the development of industry, both private and official. Electric engineering works, beet-sugar factories, breweries, ice-works, machine-works, and flax-mills have been established by private enterprise, while the railway companies have installed railway workshops and a pyrotechnical laboratory, and the State a tobacco factory. The gasworks have been municipalized, and the octrois upon necessities of life abolished. Charitable institutions have been extended by the establishment of a foundling hospital, an infant asylum, evening schools, and female educational institutes. The secondary education of the middle classes has been stimulated by the new Philological Club and the Circolo Cavour. In addition to *educatorii* (designed to amuse and feed the children of poor parents after school hours), summer school colonies have been created, which provide the poorer children with holidays on the mountains or at the seaside. Further, soup kitchens, free hospitals, sanatoria for children, an anti-rabies institute, an institute for the blind, deaf, and dumb, and above all, the Rizzoli Orthopædic Institute, are maintained for the afflicted and the deformed. The famous University has been increased by the addition of a faculty of Agriculture, and Bologna has succeeded in retaining its engineering school, while the academic renown of the occupants of the various chairs has prevented decadence. The number of students is at present 1900. Provision has been made for the erection of new educational buildings of experimental science and for the enlargement of public museums and libraries. Great attention has also been paid to the elementary schools, which were attended in 1880-81 by only 7000 children, but now are frequented by 12,500, or 85 per cent. of the children who come within the scope of the compulsory educational law of 1877. Another 10 per cent. attend private schools and colleges. Small museums and circulating libraries have been attached to nearly all the schools. Similar progress has been made in regard to the school of decorative art and the female

technical school. The school buildings have been enlarged and in some cases renewed on hygienic principles. Educational expenses have increased in proportion. In 1873 they amounted to 170,000 lire per annum, in 1886 to 290,000 lire, and are to-day more than 500,000 lire (£20,000). In respect of æsthetic, industrial, and educational requirements, Bologna still holds a high place among the progressive cities of modern Italy. Population of town (1881) 123,274, (1901) 152,009; of province (1881) 457,474, (1901) 527,642. (E. VL.)

Bologoye, a village of North Russia, half-way on the St Petersburg to Moscow railway. It is an important junction, with lines to Rybinsk and Yaroslavl, and to Pskov and Riga. It is a great depot for the upper Volga region.

Bolton-le-Moors, a municipal (extended 1898) county (1888), and parliamentary borough of Lancashire, England, on the Croal, 11 miles N.W. of Manchester, 200 miles by rail N.W. by N. of London. It has stations on the London and North-Western and the Lancashire and Yorkshire railways, with running powers for the Midland railway. It is governed by a mayor, 24 aldermen, and 72 councillors. Of recent institution are a natural history museum, an art and industrial museum, two hospitals, an orphanage, a new public park (1890), a new theatre, and 5 free lending libraries. There are about 130 cotton mills employing over 15,000 workers. In 1891 there were engaged in the manufacture of cotton and cotton goods 8130 males and 7070 females; in printing, dyeing, and bleaching of cotton and calico, 915 males and 494 females;

and 945 males and 148 females as spinning and weaving machine makers. Bolton publishes two daily and two weekly newspapers. Area of municipal and county borough in 1891, 2361 acres; population (1881), 105,414; (1891), 115,002. On the recently extended area the population in 1891 was 146,487; in 1901, 168,746.

Boma. See CONGO FREE STATE.

Bombay Presidency, a province or presidency of British India, under the administration of a governor. Politically it includes the settlement of Aden; geographically it also includes the native state of Baroda, which is in direct political relations with the governor-general. Excluding Aden, it lies roughly between 13° 53' and 28° 45' N. lat. and between 66° 40' and 76° 30' E. long. Its total area (including native states) is 194,189 square miles; the population in 1891 was 26,960,421. The capital is Bombay city, from which the province takes its name. For the hot weather, the Government moves to the hill station of Mahabaleshwar, and for the rainy season to Poona. Native states occupy more than one-third of the total area of the presidency, with nearly one-third of the population. In some parts, as in the peninsula of Kathiawar, they continuously cover the whole area; in other parts, as in the Southern Maratha country, they are awkwardly interlaced amid British territory.

Population.—The population in 1901, according to the preliminary census returns, was 25,457,553. The following table gives the area and population of the several districts and native states of Bombay according to the census of 1891:—

Area and Population of Bombay Presidency (1891).

Divisions.	Districts.	Area in Square Miles.	Number of Towns and Villages.	Population, Census of 1891.			Density of Population to Square Mile.	Population, Census of 1881.

Since 1881 the population increased by 14 per cent. in British territory, and by 16 per cent. in native states. Both these rates are considerably above the rate of increase for India generally. The average density of population ranged from 542 persons per square mile in the Gujarat district of Kaira to 60 in Sind generally, and only 23 in the desert district of Thar and Parkar. Classified according to religion, and excluding native states, Hindus numbered 14,657,179, or 78 per cent. of the total population. Mahomedans numbered 3,501,910, of whom nearly two-thirds were found in Sind, where they formed 77 per cent. of the population as opposed to 8 per cent. for the rest of the province. Jains (with whom Buddhists were included) numbered 241,061, chiefly in Belgaum, Ahmedabad, and Bombay city. Parsis numbered 73,945, of whom nearly two-thirds were in Bombay city and its immediate neighbourhood, and most of the remainder in Surat. Christians numbered 158,765, of whom 28,110 were Europeans and 9464 Eurasians, leaving 121,191 for native converts, chiefly in the Konkan districts of Thana and Kanara. Jews numbered 9639, mostly in the city of Bombay and its neighbourhood. "Others" numbered 214,545, chiefly Bhils in Khandesh and aboriginal tribes in Thar and Parkar. In the native states the proportions were much the same, except that Jains were more numerous than in British territory, forming 4 per cent. of the total population. Native Christians were chiefly found in the two states of Sawantwari and Kolhapur, bordering on Goa. According to the preliminary returns of the census of 1901, the decrease in population was 5.57 per cent. In the British districts of Gujarat, where the famine of 1899-1900 was most severely felt, the rate of decrease was from 12 to 18 per cent., and in some of the native states it was as high as from 30 to 40 per cent.

Agriculture.—Excluding Sind, the total cultivated area in the rest of Bombay in 1897-98 amounted to 23,557,557 acres, of which only 963,454 acres were irrigated, mostly from wells. In Sind, on the other hand, out of a total cultivated area of 3,802,482 acres, no less than 2,917,624 acres were irrigated, almost entirely from government canals. Cotton was grown on 2,238,609 acres in 1897-98, chiefly in the districts of Khandesh, Dharwar, Ahmedabad, and Broach. No crops are grown under European supervision, such as the indigo of Bengal or the tea of Assam.

Industries.—The most important industry of the province is that of cotton, which, besides employing about 270 factories for cleaning and pressing the raw material, supports also about 114 mills for spinning and weaving. In 1897-98 the number of cotton mills was 70 in Bombay city, 40 in the rest of the province, and 4 in native states, total 114, employing about 100,000 persons, of whom 20,000 were women, 12,000 young persons, and 6000 children. The total number of looms was 28,808, and of spindles 2,933,736; and the capital invested was nearly ten crores of rupees (say six millions sterling). The total production was estimated at 324,649,184 lb of yarn, chiefly of counts 20, 10, and 16; and 73,481,564 lb of woven goods, chiefly shirtings, tea-cloths, *dhutis*, and *chaddars*. The industry is passing through a period of severe depression, caused partly by the general effects of plague and famine, partly by the loss of almost the entire crop of cotton in

the drought of 1899, and partly by the overstocking of the China market. Other large industries include a woollen mill at Bombay, employing 363 hands; three paper-mills at Bombay, Poona, and Surat, employing 415 hands; a brewery at Dapuri, near Poona; two dyeing-works at Bombay, employing 1037 hands; 11 flour-mills at Bombay, employing 648 hands; 15 ironworks in Bombay, one of which employs 1200 hands; and a tannery at Bombay, employing 614 hands.

Railways.—The province is well supplied with railways, all of which, with one exception, concentrate at Bombay city. The exception is the North-Western line, which enters Sind from the Punjab, and finds its natural terminus at Karachi. In 1898 the total length of railway under the Bombay Government open for traffic was 6261 miles, while 246 additional miles were under construction, and 1040 miles had been surveyed. These figures do not include the railway system in Sind.

Irrigation.—With the exception of Sind, the water-supply of the Bombay presidency does not lend itself to the construction of large irrigation works. These are classified as protective, productive, and minor. In 1897-98 the total receipts from three "protective" works in the Deccan and Gujarat amounted to Rs.1,51,103, while the working expenses were Rs.95,785, and the charge for interest was Rs.3,09,149, showing a deficit of Rs.2,53,821 on a capital outlay of Rs.81,56,083. The total receipts from seven "productive" works amounted to Rs.3,52,901, while the working expenses were Rs.2,13,370, and the charge for interest was Rs.4,16,238; showing a deficit of Rs.2,76,707 on a capital outlay of Rs.1,09,10,421. In the case of 26 "minor" works, on which no interest is charged, the total receipts were Rs.1,01,056, and the expenses Rs.88,540, showing a profit of Rs.12,516, or 2 per cent. on a capital outlay of Rs.61,71,896. The figures for Sind are given under that heading.

Imports and Exports.—The sea-borne trade of the presidency is almost entirely concentrated at Bombay and Karachi, though there is considerable coasting traffic from the ports of Cutch, Kathiawar, and the Konkan. The following table gives the value (in tens of rupees) of the foreign imports and exports of merchandise only for the whole presidency (including Sind) for the six quinquennial years, 1877-78 to 1897-98:—

	Imports.	Exports.
	Rx.	Rx.
1877-78	15,699,638	23,755,287
1882-83	21,330,294	34,055,919
1887-88	29,122,076	37,034,206
1892-93	30,185,600	44,620,635
1897-98	30,754,383	32,074,314

The value (in tens of rupees) of each of the principal articles of import and export in 1897-98 was as follows:—

Imports.—Cotton piece goods, Rx.7,852,245; sugar, Rx.3,278,565; wrought metals, Rx.2,344,775; railway materials, Rx.1,807,897; mineral oils, Rx.1,089,785; machinery, Rx.1,563,477; cotton twist, Rx.978,861; provisions, Rx.866,426; silk goods, Rx.758,896; liquors, Rx.645,571; hardware and cutlery, Rx.639,923; dyeing and tanning materials, Rx.611,025. **Exports.**—Raw cotton, Rx.7,277,118; cotton

twist, Rx.6,043,332; oil-seeds, Rx.5,273,794; opium, Rx.2,203,607; cotton piece goods, Rx.1,899,858; raw wool, Rx.1,902,718; wheat, Rx.1,803,693; hides, Rx.919,350; other food grains, Rx.697,220.

A significant fact was the decline in trade with the United Kingdom during the ten years ending 1897-98. The imports from the United Kingdom fell by 3 crores of rupees, and their proportion of the total from 73 to 59 per cent. The exports to the United Kingdom fell by 3½ crores of rupees, and their proportion of the total from 24 to 16 per cent. Under imports, Germany, Russia, Belgium, and Austria each showed a very large increase; while under exports the largest increases were to Germany and Japan. Bombay is still the depot for trade with the Persian Gulf and Zanzibar, but this trade is not increasing. The interprovincial trade of Bombay by railway in 1897-98 was valued at Rs.16,71,27,000 for imports, and Rs.14,85,48,000 for exports.

Administration.—Including Sind, there are 4 divisions or commissionerships, distributed among 24 districts, each under the charge of a collector, with assistants and deputies. Many of the collectors have political duties in connexion with the numerous native states. The total number of civil and revenue judges is 266, and of magistrates of all sorts 648. In 1898, the total strength of the police (excluding Bombay city, Sind, and Aden) was 15,455 officers and men, being one policeman to every 10 square miles of area and to every 1948 of the population. In addition, there were 2121 railway police.

Army.—Since the reorganization of the Indian army in 1894 the Bombay command, under a lieutenant-general, comprises Baluchistan, and parts of Rajputana, Central India, and the Central Provinces, in addition to the Bombay presidency, with headquarters at Poona. It consists of three first-class and five second-class military districts, of which Poona and Bombay alone lie entirely within the presidency. In 1898 the strength of the Bombay command was 14,636 European and 30,103 native troops; total, 44,739. In addition there were 5710 volunteers.

Local Government.—Excluding Bombay city, the number of municipalities in the presidency is 167, with an aggregate population of 2,245,000. The total number of municipal commissioners is 2343, of whom 908 are elected. In 1897-98 the aggregate municipal income (excluding loans) was Rs.47,00,000, of which Rs.34,68,000 was derived from taxation, the incidence of taxation being nearly Rs.2 per head of population. The aggregate expenditure was Rs.67,00,000, of which Rs.27,36,000 was devoted to public health and convenience, Rs.6,35,000 to education, Rs.5,34,000 to plague, and Rs.2,48,000 to public safety. The number of district boards is 23, and of taluk or subdivisional boards 205. Almost all of these boards are partly elective. The total number of members is 3538, of whom 1593 are elected. In 1897-98 the aggregate income of all the local boards was Rs.44,94,000, of which Rs.27,34,000 was derived from rates. The aggregate expenditure was Rs.47,65,000, of which Rs.22,55,000 was devoted to public works, Rs.15,59,000 to education, and Rs.3,19,000 to medical.

The following is the net revenue and expenditure of Bombay for 1897-98 (in tens of rupees), distributed under the three heads of imperial, provincial, and local:—Net revenue, imperial, Rx.8,414,539; provincial, Rx.2,931,442; local, Rx.332,748; total, Rx.11,678,729. Net expenditure, imperial, Rx.4,966,446; provincial, Rx.2,876,452; local, Rx.387,738; total, Rx.8,230,636. Of the total revenue, Rx.3,678,082 was derived from land, Rx.2,287,245 from salt, Rx.1,904,348 from customs, and Rx.1,033,637 from excise.

Education.—The following table gives the chief statistics of education in Bombay for the years 1886-87 and 1896-97:—

	1886-87.		1896-97.	
	Schools.	Pupils.	Schools.	Pupils.
Colleges	13	1,633	14	1,824
Secondary Schools	388	38,064	466	36,164
Primary Schools	7,520	434,377	9,572	561,160
Special Schools	75	2,225	50	2,778
Private Institutions	2,927	65,737	2,832	70,779
Total	10,923	542,036	12,934	672,705

If we compare the number of pupils with the estimated population of school-going age (15 per cent. of the total population), the increase in ten years has been from 15.5 to 16.6 per cent. Taking girls alone, the number at school increased from 52,941 in 1886-87 to 82,163 in 1896-97, or by 56 per cent.; while the proportion to the female population of school-going age rose from 3.1 to 4.2 per cent. A feature in the Bombay system of public instruction is the success with which it has been extended to native states. In 1896-97, the total number of pupils in native states (not including Baroda) was 153,798, of whom 14,182 were girls. In 1886-87 the total expenditure on education was Rs.49,95,970, in 1896-97 it was Rs.78,72,931.

Public Calamities.—During the last few years the entire history of Bombay has been sadly affected by plague and famine. Bubonic plague, of a very fatal and contagious nature, first broke out in Bombay city in September 1896, and, despite all the efforts of the Government, quickly spread to the surrounding country. Since that date there have been fluctuations in the mortality, but the disease has never disappeared entirely. From September 1896 to March 1901, a period of four and a half years, the total number of deaths recorded from plague was no less than 335,555. The great cities of Bombay, Karachi, and Poona suffered most severely. A few districts in Gujarat almost entirely escaped; but the mortality was very heavy in Satara, Thana, Surat, Poona, Kolaba, and in the native states of Cutch, Baroda, Kolhapur, and Palanpur. The only sanitary measure that can be said to have been successful was complete migration, which could only be adopted in villages and smaller towns. Inoculation was extensively tried in some cases. Segregation was the one general method of fighting the disease; but, unfortunately, it was misunderstood by the people and led to some deplorable outbreaks. In Poona, during 1897, two European officials were assassinated; the editor of a prominent native paper was sentenced to imprisonment for sedition; and two leaders of the Brahman community were placed in confinement. At Bombay, in March 1898, a riot begun by Mahomedan weavers was not suppressed until several Europeans had been fatally injured. In Nasik district, in January 1898, the native chairman of the plague committee was brutally murdered by a mob. But on the whole the people submitted with characteristic docility to the sanitary regulations of the Government. Bombay, like the Central Provinces, suffered from famine twice within three years. The failure of the monsoon of 1896 caused widespread distress throughout the Deccan, over an area of 46,000 square miles, with a population of 7 millions. The largest number of persons on relief was 301,056 in September 1897; and the total expenditure on famine relief was Rs.1,28,00,000. The measures adopted were signally successful, both in saving life and in mitigating distress. In 1899 the monsoon again failed in Gujarat, where famine hitherto had been almost unknown; and the winter rains failed in the Deccan, so that distress gradually spread over almost the entire presidency. The worst feature was a virulent outbreak of cholera in Gujarat, especially in the native states. In April 1900 the total number of persons in receipt of relief was 1,281,159 in British districts, 566,671 in native states, and 71,734 in Baroda (Sir W. W. Hunter, *Bombay*, 1885-1890, London, 1892). For 1900-1 the total expenditure on famine relief was nearly 3 crores (say, £2,000,000 sterling); and a continuance of drought necessitated an estimate of 1 crore in the budget of the following year. (J. S. Co.)

Bombay City, the capital of Bombay presidency and chief seaport of Western India; situated in 18° 55' N. lat. and 72° 54' E. long. The city stands on an island of the same name, which forms one of a group now connected by causeways with the mainland. It occupies an area of 22 square miles; the population in 1881 was 773,196; in 1891 it was 821,764, showing an increase of 6 per cent.; and in 1901 it was 770,843, showing a decrease of 6 per cent., due to the effects of continued plague. Bombay thus falls to the second place, below Calcutta; but it is still the third most populous city in the British empire.

Classified according to religion, Hindus in 1891 numbered 543,276; Mahomedans, 155,247; Christians, 45,310, of whom 11,294 were Europeans and 4326 Eurasians, leaving 29,690 native converts, mostly Goanese; Parsis numbered 47,458, more than half the total in all India; Jains (including Buddhists), 25,415; Jews, 5021, nearly half the total in the presidency; "others," 37.

Bombay city is the centre of the cotton industry. In 1898 the number of cotton-mills was 70, with 19,303 looms and 2,040,409 spindles, employing about 65,000 hands, and consuming about 2,377,000 cwt. of cotton. The total number of factories of all kinds under inspection was 130, employing about 88,000 operatives.

Bombay contests with Calcutta the first place in the maritime trade of India. As the terminus of three railway systems, it serves Western and Central India; but this region cannot vie in productiveness with the valley of the Ganges. Bombay's commerce, like her cotton industry, has suffered severely in recent years from drought and plague. The following table gives the value (in tens of rupees) of the foreign imports and exports for the five years, 1893-94 to 1897-98:—

	Imports. Rx.	Exports. Rx.
1893-94	29,262,413	38,736,680
1894-95	28,786,724	34,371,984
1895-96	27,866,711	37,933,015
1896-97	26,855,083	33,162,284
1897-98	24,605,163	27,457,899

In 1897-98 the coasting trade was valued at Rs.10,42,58,674 for imports, and Rs.9,75,27,197 for exports.

In 1897-98, 40,051 vessels of 2,665,727 tons entered; and 31,264 vessels of 2,595,515 tons cleared the port.

The port of Bombay (including docks and warehouses) is managed by a port trust, the members of which are nominated by the Government from among the commercial community. In 1897-98 the revenue of the port trust was Rs.46,48,409, and the expenditure Rs.48,47,049, showing a deficit of Rs.1,98,640. The expenditure included Rs.24,67,927 for interest and sinking fund on a capital debt amounting to Rs.5,20,88,058. The municipal government of the city was framed by an Act of the Bombay legislative council passed in 1888. The governing body consists of a municipal corporation and a town council. The corporation is composed of 72 members, of whom 16 are nominated by the Government. Of the remainder, 36 are elected by the ratepayers, 16 by the justices of the peace, 2 by the senate of the university, and 2 by the chamber of commerce. The council, which forms the standing committee of the corporation, consists of 12 members, of whom 4 are nominated by the Government and the rest elected by the corporation. Of the members of the corporation in 1898, 18 were Europeans, 16 Hindus, 12 Mahomedans, and 24 Parsis. In 1897-98 the total revenue was Rs.67,08,505, and the total expenditure Rs.74,96,970; on 31st March 1898 the total amount of loans outstanding was Rs.4,11,20,498, bearing interest at rates varying from 5 to 3½ per cent. A large proportion of these loans had been raised for waterworks and similar permanent outlay; but during 1897-98 it was found necessary to borrow no less than Rs.27,00,000 for temporary purposes. In this embarrassed condition of the corporation a new body was constituted in 1898 for the improvement and future expansion of the city, under the title of "Trustees for the Improvement of the City of Bombay." The board of trustees consists of fourteen members, of whom seven are elected. Their duties are to form new and alter existing streets, to remove and alter insanitary buildings, to provide open spaces for better ventilation and for recreation, to construct new sanitary dwellings for certain classes of the inhabitants, to lay out vacant lands, and to reclaim parts of the foreshore of the island. In April 1900 the Bombay Improvement Trust raised a loan of Rs.50,00,000 (say £333,333), in 4 per cent. debentures, on the London market.

The Bombay University was constituted in 1857 as an examining body, on the model of the University of London. During the five years ending 1897 the total number of persons who matriculated was 4813, while 815 graduated B.A., 859 passed examinations in law, 416 in medicine, and 314 in engineering. The chief educational institutions in Bombay city are the Government Elphinstone College, two missionary colleges (Wilson and St. Xavier), the Grant Medical College, the Government law school, the Sir Jamsetji Jijibhai School of Art, and the Victoria Jubilee Technical Institute. There are altogether twenty-four high schools for boys, and ten for girls. In 1897-98, a year of plague, the total number of pupils under instruction was 22,204, being 3·4 per cent. of the population.

The effects of the plague in Bombay city may be briefly shown by a few figures. From September 1896 to July 1898 the number of cases recorded was 31,083, of whom 27,533 died. In three years the number of deaths from plague was 1811 in 1898, 15,692 in 1899, and 13,247 in 1900. During 1897 the total number of deaths from all causes was 47,896, equal to a death-rate of 58·3 per thousand, compared with an average death-rate of 35 per thousand for the preceding five years. Among Europeans alone the death-rate was only 19 per thousand. In 1899 the death-rate rose to 69·5 per thousand.

(J. S. Co.)

Bona (French, *Bône*), a seaport town of Algeria, on a bay of the Mediterranean, in the department of Constantine, 220 miles by rail W. of Tunis, with railway connexion with Guelma and Constantine. It is the seat of a sub-prefecture and an important commercial centre for the export of cereals, oils, corks, wools, and minerals. It owes its prosperity to the rich plain surrounding it. The port is now one of the best and safest on the Mediterranean coast, having been considerably enlarged in 1896-98. Its tonnage, 298,223 in 1890, amounted in 1898 (entered and cleared) to 583,144. There are forty-six merchant ships registered at the port. From 18,866 in 1872, the population increased to 26,475 in 1891, and 32,498 in 1900. Of this 12,011 were French, 7800 were Arabs, and about 12,500 were foreigners, chiefly Italians and Maltese.

Bonaparte, Napoleon Joseph Charles Paul (commonly known as PRINCE NAPO-

LEON, or by the *sobriquet* of "Plon-Plon"¹), (1822-1891), the second son of Jerome Bonaparte, king of Westphalia, by his wife Catherine, princess of Würtemberg, was born at Trieste, 9th September 1822. After the French revolution of 1848 he was elected to the National Assembly as a representative of Corsica, and (his elder brother, Jerome Napoleon Charles, dying in 1847) assumed the name of Jerome. Notwithstanding his ostensible opposition to the *coup d'état* of 1851, he was, upon the establishment of the empire, placed in the direct line of succession, and received a liberal dotation, but was allowed no share in public affairs. Privately he professed himself the representative of the Napoleonic tradition in its democratic aspect, and associated mainly with men of advanced political opinions. In 1854 he took part in the Crimean campaign as general of division. His conduct at the battle of the Alma occasioned imputations upon his personal courage, but they seem to have been entirely groundless. Returning to France, he undertook the chief direction of the National Exhibition of 1855, in which he manifested great capacity. In 1858 he was appointed minister for the Colonies and Algeria, and his administration aroused great hopes, but his activity was diverted into a different channel by his sudden marriage in January 1859 with the Princess Clotilde, daughter of Victor Emmanuel, a prelude to the war for the liberation of Italy. In this war Prince Napoleon commanded the French corps that occupied Tuscany, and it was expected that he would become ruler of the principality, but he refused to exert any pressure upon the inhabitants, who preferred union with the Italian kingdom. The next few years were chiefly distinguished by remarkable speeches which displayed the prince in the unexpected character of a great orator. Unfortunately his indiscretion equalled his eloquence: one speech (1861) sent him to America to avoid a duel with the duke d'Aumale; another (1865), in which he justly but intemperately protested against the Mexican expedition, cost him all his official dignities. He was, nevertheless, soon restored to the position of dubious favour which he generally occupied under his cousin's reign, and was influential in effecting the reform by which, in 1869, it was sought to reconcile the empire with Liberal principles. The fatal war of 1870 was resolved upon during his absence in Norway, and was strongly condemned by him. After the first disasters he undertook an ineffectual mission to Italy to implore the aid of his father-in-law; and after the fall of the empire lived in comparative retirement until the death of the Prince Imperial (1879) made him direct heir to the Napoleonic succession. His part as Imperial pretender was unfortunate and inglorious: his democratic opinions were unacceptable to the Imperial party, and ere his death he was virtually deposed in favour of his son Prince Napoleon Victor. He died at Rome, 17th March 1891. His eldest son, Prince NAPOLEON VICTOR (born 1862), has since then been the head of the French Bonapartist party; but the second son, Prince LOUIS NAPOLEON, an officer in the Russian army, has given more reason to suppose that he has inherited some of the finer characteristics of his family. Prince Napoleon's sister, Princess MATHILDE LETITIA WILHELMINE BONAPARTE, born at Trieste, 27th May 1820, married in October 1841 Prince Anatole Demidoff. The prince's conduct led to a separation within four years, and he was compelled by the Tsar Nicholas to make the princess a handsome allowance. After the election of her cousin, Louis Napoleon, as president of the Republic, the princess took up her residence in Paris, and did the honours of the *Élysée* until his

¹ Derived, it is supposed, from the nickname "Plomb-plomb," or "Craint-plomb" (fear-lead), given him by his soldiers in the Crimea.

marriage. She has since continued to reside in Paris, distinguished as the friend and patron of men of letters and artists, and herself displaying no mean skill as a painter.

Able man though he was, Prince Napoleon was disqualified by character and temperament from success in public life. His democratic convictions, however sincere, coexisted with a despotic temper; his independence, in itself highly honourable to him, became in its excess disdain for public opinion and offensive brusqueness; while despising princely affectations, he failed to manifest princely dignity or princely munificence; and his private life was by no means exemplary. It would, moreover, have been difficult for any one to have resisted the constant stream of calumny directed against him by the absolutist and clerical sections of the Imperialist party; he was constantly taxed with disloyalty to the emperor, and yet, when his proceedings are impartially reviewed, he appears to have opposed all the mistakes that proved fatal to the dynasty, and to have invariably given the soundest advice. In the character of his intellect, as in personal appearance, he bore an extraordinary resemblance to the first Napoleon, possessing the same marvellous lucidity of insight, and the same gift of infallibly distinguishing the essential from the non-essential. He was a warm friend of literature and art, and in a private station would have achieved high distinction as a man of letters.

(R. G.)

Bonaparte, Napoleon Eugène Louis Jean Joseph, PRINCE IMPERIAL (1856-1879), son of the Emperor Napoleon III. and the Empress Eugénie, was born at Paris 16th March 1856. He received a careful education, and was considered a youth of promise. In the Franco-German war of 1870 he went to the front, though aged only fourteen, and much dynastic capital was made of his "baptism of fire" and his having discharged a mitrailleuse at the battle near Saarbrücken. So soon, however, as the campaign threatened to become disastrous he was sent to Brussels, and speedily joined his mother in England, residing at Chislehurst. Upon his father's death in 1873 he was proclaimed by the imperialist party as Napoleon IV., passing under the title of count de Pierrefonds. He had already, in 1872, entered the military academy at Woolwich, where he made fair progress in his studies, and gained the esteem of his teachers and companions by his amiable disposition. Desirous of acquiring military experience, and of recommending himself to the French nation by exploits in the field, he volunteered for service in the Zulu war, and departed for South Africa on 27th February 1879. His period of military service was short indeed, for he was killed in a reconnaissance on 1st June. His remains were brought home, and interred with those of his father at Chislehurst. His death was an event of considerable political importance, virtually destroying the Bonapartist party in France by transferring its leadership to the unpopular Prince Napoleon Jérôme. The Prince Imperial's amiable character, and the romantic interest attaching to him, would have made him a formidable pretender in the event of any internal trouble menacing the stability of the Republic.

(R. G.)

Bonghi, Ruggero (1828-1895), Italian politician, was born at Naples, 20th March 1828. Exiled from Naples in consequence of the movement of 1848, he took refuge in Tuscany, whence he was compelled to flee to Turin on account of a pungent article against the Bourbons. At Turin he resumed his philosophic studies and his translation of Plato, but in 1858 refused a professorship of Greek at Pavia, under the Austrian Government, only to accept it in 1859 from the Italian Government. In 1860, with the Cavour party, he opposed the work of Garibaldi, Crispi, and Bertani at

Naples, and became secretary of Luigi Carlo Farini during the latter's lieutenancy, but, in 1865, assumed contemporaneously the editorship of the *Perseveranza* of Milan and the chair of Latin literature at Florence. Elected deputy in 1860 he became celebrated by the biting wit of his speeches, while, as journalist, the acrimony of his polemical writings made him a redoubtable adversary. Though an ardent supporter of the historic Right, and, as such, entrusted by the Lanza Cabinet with the defence of the law of guarantees in 1870, he was no respecter of persons, his caustic tongue sparing neither friend nor foe. Appointed minister for public instruction in 1873, he, with feverish activity, reformed the Italian educational system, suppressed the privileges of the university of Naples, founded the Vittorio Emanuele library in Rome, and prevented the establishment of a Catholic university in the capital. Upon the fall of the Right from power in 1876 he joined the Opposition, and, with characteristic vivacity, protracted during two months the debate on Baccelli's University Reform Bill, securing, single-handed, its rejection. A bitter critic of King Humbert, both in the *Perseveranza* and in the *Nuova Antologia*, he was, in 1893, excluded from court, only securing re-admission shortly before his death, on 22nd October 1895. In foreign policy a Francophil, he combated the Triple Alliance, and took considerable part in the organization of the inter-Parliamentary peace conference.

(H. W. S.)

Bonham, a city of Texas, U.S.A., capital of Fannin county, in the N.E. part of the state, on a line of the Texas Pacific railway, and an important point in the shipment of cotton. Population (1890), 3361; (1900), (5042).

Bonheur, Marie Rosalie, known as ROSA BONHEUR (1822-1899), one of the most famous women artists of the 19th century, was born at Bordeaux, in France, on the 22nd March 1822. She was of Jewish origin. Jacques Wiener, the Belgian medallist, a native of Venloo, says that he and Raymond Bonheur, Rosa's father, used to attend synagogue in that town; while another authority asserts that Rosa used to be known in common parlance by the name of Rosa Mazeltov (a Hebrew term for "good luck," *Gallicé* Bonheur). She was the eldest of four children, all of whom were artists: Auguste (1824-1884) painted animals and landscape; Juliette (1830-1891), "honourably mentioned" at the exhibition of 1855; Isidore, born in 1827, a sculptor of animals. Rosa at an early age was taught to draw by her father (who died in 1849), and he, perceiving her very remarkable talent, permitted her to abandon the business of dressmaking, to which, much against her will, she had been put, in order to devote herself wholly to art. From 1840 to 1845 she exhibited at the salon, and five times received a prize; in 1848 a medal was awarded to her. Her fame dates more especially from the exhibition of 1855; from that time Rosa Bonheur's works were much sought after in England, where collectors and public galleries competed eagerly for them. What is chiefly remarkable and admirable in her work is that, like her contemporary, Brascassat, she represents animals as they really are, as she saw them in the country. She gives us a picture of real life, instead of the often artificial presentment of rural scenes and incidents of animal life. Her gift of accurate observation was, however, allied to a certain dryness of style in painting; she often failed to give a perfect sense of atmosphere. On the other hand, the anatomy of her animals is always faultlessly true. There is nothing feminine in her handling; her treatment is always manly and firm. Of her many works, we may note the following—"Ploughing in the Nivernais" (1848), in the Luxembourg gallery (see Plate); "The

"PLOUGHING IN THE NIERNAIS." By ROSA BONHEUR.

"THE HORSE FAIR." By ROSA BONHEUR.

Horse Fair" (1853), one of the two replicas of which is in the National Gallery, London, the original being in the United States (see Plate); and "Hay Harvest in Auvergne" (1855). She was "decorated" with the Legion of Honour by the Empress Eugénie, and was subsequently promoted to the rank of "officer" of the order. After 1867, Rosa Bonheur exhibited but once in the salon, in 1899, a few weeks before her death. She lived quietly at her country house at By, near Fontainebleau, where, for some years she had held gratuitous classes for drawing. She left at her death a considerable number of pictures, studies, drawings, and etchings, which were sold by auction in Paris in the spring of 1900. (H. Fr.)

Bonhill. See ALEXANDRIA.

Boni (BONÉ), a vassal state belonging to the government of Celebes and its dependencies (Dutch East Indies), on the south-west peninsula of Celebes (*q.v.*), on the Gulf of Boni. Its area is 2548 square miles. The chief products are rice, tobacco, coffee, cotton, and sugar-cane, none of them important exports. The buffaloes and horses of this state are highly-esteemed breeds. The trade, shipping, and fishery, are in a state of decline. The chief town, Boni, lies 80 miles north-east of Macassar.

For the wars in Boni, see PERELAER, *De Bonische expeditiën*, 1859-60, Leiden, 1872; and MEYERS, in the *Militaire Spectator* (1880).

Bonifacio, a coast town in the arrondissement of Sartine, Corsica, 42 miles in direct line S.E. of Ajaccio, on the railway from Bastia. Cork-cutting, an industry of recent growth, employs in a single factory 200 persons, producing annually 50 millions of corks. Population (1881), 2790; (1896), 3191, (comm.) 3587.

Bonin Islands, called by the Japanese Ogasawarajima, a chain of small islands stretching nearly due north and south, a little to the east of 142° E. long., and from 26° 35' to 27° 45' N. lat. They number twenty, according to Japanese investigations, and have a coast-line of 174·65 miles long and a superficies of 28·82 square miles. Only ten of them have any appreciable size, and these are named—commencing from the north—Mukushima (Bridegroom Island), Nakadachi-shima (Go-between Island¹), Yome-shima (Bride Island), Ototo-jima (Younger-brother Island), Ani-shima (Elder-brother Island), Chichi-jima (Father Island), Haha-jima (Mother Island), Mei-jima (Niece Island), Ani-jima (Elder-sister Island), and Imoto-jima (Younger-sister Island). European geographers have been accustomed to divide the islands into three groups for purposes of nomenclature, calling the northern group the Parry Islands, the central the Beechey Islands, and the southern the Coffin, or Bailey Islands. The second largest of all, that is to say Chichi-jima (Father Island), in Japanese cartography, was called "Peel Island" in 1827 by Captain Beechey, and the same officer gave the name of "Stapleton Island" to the Ototo-jima of the Japanese, and that of "Buckland Island" to their Ani-jima. To complete this account of Captain Beechey's nomenclature, it may be added that he called a large bay on the south of Peel Island "Fitton Bay," and a bay on the south-west of Buckland Island "Walker Bay."² Port Lloyd, the chief anchorage (situated on Peel Island), is considered by Commodore Perry—who visited the islands in 1853 and strongly urged the establishment of a United States coaling station there—to have been formerly the crater of a volcano from which the surrounding hills were thrown

up, the entrance to the harbour being a fissure through which lava used to pour into the sea. The islands are, indeed, plainly volcanic in their nature.

History.—The diversity of nomenclature indicated above suggests that the ownership of the islands was for some time doubtful. According to Japanese annals they were discovered towards the close of the 16th century, and added to the fief of a Daimyo, Ogasawa Sadayori, whence the name "Ogasawara-jima." They were also called *Bunin-jima* (corrupted by foreigners into "Bonin") because of their being without (*bu*) inhabitants (*nin*). Effective occupation did not take place, however, and communications with the islands ceased altogether in 1635, as was a natural consequence of the Japanese Government's veto against the construction of sea-going vessels.³ In 1728 fitful communication was restored by the then representative of the Ogasawara family, only to be again interrupted until 1861, when an unsuccessful attempt was made to establish a Japanese colony at Port Lloyd. Meanwhile, Captain Beechey having visited the islands in the *Blossom*, having assigned names to some of them, and having published a description of their features, a small party consisting of two British subjects, two American citizens, and a Dane, sailed from the Sandwich Islands for Port Lloyd in 1830, taking with them some Hawaiian natives. These colonists hoisted the British flag on Peel Island (Chichi-jima), and settled there. When Commodore Perry arrived in 1853, there were on Peel Island thirty-one inhabitants, four being English, four American, one Portuguese, and the rest natives of the Sandwich Islands, the Ladrões, &c.; and when Mr Russell Robertson visited the place in 1875, the colony had grown to sixty-nine, of whom only five were pure whites. Mr Robertson found them without education, without religion, without laws, and without any system of government, but living comfortably on clearings of cultivated land. English was the language of the settlers, and they regarded themselves as a British colony. But (in 1861) the British Government renounced all claim to the islands in recognition of Japan's right of possession. There is now regular steam communication; the affairs of the islands are duly administered, and the population has grown to 4519. There are no mountains of any considerable height in the Ogasawara Islands, but the scenery is hilly with occasional bold crags. The vegetation is almost tropically luxuriant, palms, wild pineapples, and ferns growing profusely, and the valleys being filled with wild beans and patches of taro. Mr R. Robertson catalogues a number of valuable timbers that are obtained there, among them being Tremana, cedar, rose-wood, iron-wood (red and white), box-wood, sandal, and white oak. The kekop tree, the orange, the laurel, the juniper, the wild cactus, the curry plant, wild sage, and celery flourish. No minerals have yet been discovered. The shores are covered with coral; earthquakes and tidal waves are frequent, the latter not taking the form of bores, but of a sudden steady rise and equally sudden fall in the level of the sea; the climate is rather tropical than temperate, but sickness is almost unknown among the residents. (F. Br.)

Bonn, a town of Prussia, in the Rhine province, 21 miles by rail S. by E. from Cologne, on the left bank of the Rhine. The river is here crossed by a fine bridge (1896-98), 1417 feet in length, flanked by an embankment two miles long, above and parallel with which is the Coblenzer Strasse, with beautiful villas and pretty gardens reaching down to the Rhine. There is a new railway station, which is not only commodious, but also a handsome structure. The minster was restored in 1875 and following years, and in 1890-94 was adorned with paintings by Martin. The "Stiftskirche" has been rebuilt, 1879-84. "Der alte Zoll," commanding a magnificent view of the Seven Mountains, is the only remaining bulwark of the old fortifications, the Sternthor having been lately removed in order to open up better communication with the rapidly increasing western suburbs and the terminus of the light railway to Cologne. The Roman Catholic archiepiscopal theological college, beautifully situated on an eminence overlooking the river, dates from 1892, and the provincial museum of antiquities from 1889-93. In 1889 a museum of Beethoven relics, &c., was opened in the house in which the musician was born. There are further a municipal museum, arranged in a private house since 1882, the academic art museum (1884), with some classic originals, a creation of F. G.

¹ Referring to the Japanese custom of employing a go-between to arrange a marriage.

² These details are taken from *The Bonin Islands* by Russell Robertson, formerly H.B.M. Consul in Yokohama, who visited the islands in 1875.

³ The Bonins are 500 miles from the main island of Japan.

Welcker, and the provincial museum, lying near the railway station, which contains a collection of mediæval stone monuments and works of art, besides a small picture gallery. Amongst the university institutions may be mentioned the physical institute, eye hospital, ear hospital, palæontological museum, on the south of the old town; the pathological institute and medical schools on the north; and the chemical laboratory, anatomical school, and physiological institute at Poppelsdorf. The university library now numbers some 250,000 vols. and about 1350 MSS. The university itself was in 1900 attended by 2162 students, and had 152 professors. One of the most conspicuous features of Bonn, viewed from the river, is the pilgrimage (monastic) church of Kreuzberg (1627), behind and above Poppelsdorf; it has a flight of 28 steps, which are so venerated that they used to be ascended on the knees. Here, too, are a large provincial lunatic asylum (1883) and an agricultural college. In the chief cemetery are the tombs of (amongst others) Niebuhr, A. W. Schlegel, Schumann, Bunsen, and Simrock; also, Schiller's wife. The town is adorned with a marble monument of the 1870-71 war (1877), and with a fine fountain (1879). There are but few industries, chiefly jute spinning and weaving, the manufacture of porcelain, flags, machinery, and beer, and saw-milling. There are considerable numbers of foreign residents, notably English, attracted by the natural beauty of the place and by the educational facilities it affords. Population (1885), 35,989; (1900), 50,741.

Book-binding.—Recent years have witnessed a marked revival of interest in the art of book-binding, which, since the death of Roger Payne in 1797, had, in England, been wanting in vigour and originality. Concurrently with the revival of the easily appreciated artistic side of the subject, there has also arisen a remarkable development in the technical processes, owing to the invention of ingenious and delicate machinery which is capable of executing the work which has hitherto been always laboriously done by hand. The processes of folding the printed sheets, and sewing them together on bands, rounding the backs when sewn, and of making the outer cases, covering them with cloth or leather, and stamping designs upon them, can now all be efficiently executed by means of machines. The saving in time and labour thus effected is very great, although it must be said that the old methods of carrying out the process of sewing and rounding the backs of books by hand labour were safer and stronger, as well as being much less liable to bruise and injure the paper (Figs. 1, 2). These processes unfortunately are not only slow but also necessitate highly skilled labour. Already the larger trade binders utilize machines extensively and advantageously, but exclusively high-class trade binders do not as yet materially depart from the older methods. Private binders have naturally no reason to use machines at all. Fine and delicate examples of large electrotpe blocks have been very successfully used for the decoration of covers measuring about 11½ by 8 inches. For the decoration of book-covers in gold alone it is probable that in the near future more use will be made of such blocks produced by the aid of photography from drawings, or from ordinary working designs made out in lamp black on white paper.

Besides the large trade binders working mainly by the help of machinery, and producing a great quantity of bound work which is not expected to last long, there also exists in London a small class of art binders who work throughout upon the principles which have been continuously in use for first-class work ever since about the 5th century, when vellum first began to be folded in

quires. These binders are inaugurating what will in due time be recognized as the 19th-century style of decoration for book-bindings. The initial impetus to this school can be traced to William Morris, who actually made some beautiful designs himself for book-bindings, to be executed both in gold and in blind. Although he probably did not fully appreciate either the peculiar limitations or the possibilities of the art of gold-tooling on leather, nevertheless his genius guided him truly as to the spirit in which the designs should be conceived. The revived art soon reached its first stage of development under the guidance of Mr T. J. Cobden-Sanderson, who may fairly be considered as the founder of the modern school of design for gold-tooling on book-covers, the pre-eminence and individuality of his work in this direction being proved by the number of his imitators. Among the most successful of his pupils is Mr Douglas Cockerell, whose work is distinguished by a marked originality of treatment, while it shows a scholarly appreciation of ancient methods. A number of women artists, both in England and in America, have already discovered in book-binding a fitting and lucrative field for their energies. One, Miss Sarah Prideaux, is not only skilled and original in her own work, but she has also given us much valuable literature on her subject. Miss E. M. MacColl may claim to be the inventor of the small curved gold line produced by means of a tiny wheel, for though the

FIG. 1.—Section of back of book sewn on bands.

FIG. 2.—Section of same book after it has passed through the machine for rounding and backing.

possibility of producing such a line in blind was known for a long time, it was rarely used. The graceful curves and lines found on Miss MacColl's work are designed for her by her brother, Mr. D. S. MacColl. Miss Birkenruth recalls the highly decorative mediæval binding by her use of jewels cut *en cabochon*, but set in morocco instead of gold or silver, and there are many others who are working well and earnestly at art binding with delicate skill and taste. Outside the inner circle of professional book-binders, there is now growing up a new profession indirectly, but nearly, affecting their productions. It is that of the designer for pictorial book-covers, especially those intended to be shown in colour on cloth or paper. It is probably true that first-rate book-binding should be begun, carried forward, and finished entirely by the same artist from his own designs; still, the decoration of a cheap binding with a colour picture or design stamped upon it in colour from blocks, may be considered purely an artist's province.

As a designer for gold-tooling in book-bindings Mr Lewis F. Day has already brought his unrivalled knowledge into use. Mr A. A. Turbayne, himself a skilled finisher, is thoroughly conversant with the technical peculiarities of the art, and his designs consequently are pre-eminently workable. Mr. Walter Crane and Mr. Charles Ricketts have studied more especially pictorial art as applicable to book-covers.

Modern book-binding machines of all kinds are usually driven by steam-power, and in consequence of the necessary setting of most of them accurately to some particular size of book, they are

not suitable for binding books of different sizes; but the full advantage of them can only be taken in the case of a large edition of one book.

Sewing Machine (Fig. 3).—American patent book-sewing machines appear to be largely of German manufacture. They are of two kinds; one sews the books on bands, either flat or round, and the

FIG. 3.—Stitching Machine.

other supplies the place of bands by a kind of chain stitch. The band-working machines bring the return thread back by pulling it through the upper and lower edges of the back of each section, thereby to some extent weakening each section, but at the same

time this weakening can be to some extent neutralized by careful headbanding. The other system, where the band is replaced by a chain stitch, brings back the return thread inside each section; the objection to this is that there is a flattening out of the back of the

FIG. 4.—Case-making Machine.

book, which becomes a difficulty when the subsequent operation of covering the book begins. The sections are sewn continuously in a long line, and are afterwards cut apart. The threads catch into hooked needles and are drawn through holes made by piercers set

to a certain distance; a shuttle like that used in an ordinary sewing machine sews the inner thread backwards and forwards. Each section is placed upon a sort of metal saddle by the hand of the operator; one after the other, the machine working continuously

unless the action is cut off or controlled by a foot-lever or pedal. This machine is probably the type of the book-sewing machine of the future, as it is much quieter to work than the other, and although the inner threads are too bulky to be quite satisfactory, this is not a serious matter like the cutting of the upper and lower edges of the back already described, and, moreover, is probably capable of being either improved away or so minimized that it will become of small importance.

Rounding and Backing Machine.—An American machine for rounding and backing sewn books has been placed on the market. It requires a rather elaborate and very careful setting of several parts to the exact requirement of each size to be worked. The sewn book with the back glued is caught in a clip and forced between two tight rollers, the result being that the hitherto flat back is automatically turned into a rounded shape (Figs. 1 and 2). The book is then drawn forward, by a continuance of the onward movement, until it reaches the rounding plate, which is a block of steel with a polished groove a little larger than the size required. This rounding plate moves within a small arc by means of heavy counterweights, and on the back of the book being strongly pressed against it, it receives the permanent form of the groove cut in it, at the same time a strong grip on each side of the book causes the

Fig. 5.—Rounding and Backing Machine.

ledge to rise up along each outer edge of the back. This ledge it is which enables the boards to be subsequently fixed in such a way as to hinge on a line outside the actual and natural boundary of the book. Before the discovery of the possibility of producing this ledge, the boards of books hinged upon a line coincident with the inner edges of the back, the result of which was that when the book was opened there was an invariable tendency to open and pull away the few outer sections of the paper or vellum itself—a destructive and disagreeable peculiarity. These machines are capable, after they are properly set, of rounding and backing about 750 volumes of the same size, within an hour.

Casing Machine.—A German patent machine for making cases, or “case” covers (Fig. 4), for books, is produced by an American firm. It is a large and complicated machine, but beautifully effective. It contains altogether over fifty springs, some of which are very small, like watch fittings, while others are large and powerful. The machine is fed with pieces of cardboard cut exactly to the sizes of the required boards, other pieces cut to the size of the back, and a long roll of the cloth with which the cases are to be covered, and when set working the roll of cloth is gradually unwound and glued by contact with a roller, which is drawn along until it reaches a point where the two boards are ingeniously dropped upon it one by one, then on again to where a long arm swings backwards and forwards, at each movement picking up a piece of cardboard for the back and placing it gently exactly upon the glued bed left for it between the two boards already fixed. Next, as the cloth passes along, it comes under the sharp influence of two rectangular gouges which cut out the corners, the remaining side pieces being gradually but irresistibly turned up by hollow raisers and flattened down by small rollers, a very delicate piece of machinery finishing the corners in a masterly way. Then, lastly, an arrangement of raisers and rollers acting at right angles to the last mentioned turn

over and press out the remaining pieces of cloth. Of course each piece of cloth is cut across at the proper point before the turning up begins. This machine is capable of producing 1200 cases in an hour of any size that the machine will take.

Wiring Machine.—This executes a cheap form of sewing for keeping together thin parts of periodicals or tracts, and is simple in construction and use. It drives a short wire pin, bent at right angles at each end, through the folds of the sections of a book or through the entire thickness, sideways, after the manner of stabbing. The projecting ends, when through the substance of the paper, are bent over and flattened so as to grip firmly. The metal used for these pins was at first very liable to rust, and consequently did much damage to the paper near it, but this defect has now been largely remedied. At the same time the principle of using hard metal wire instead of flexible hempen thread is essentially vicious, and should only be used as a temporary expedient for publications of little value.

Blocking Machine.—The machines now used for blocking designs upon book-covers are practically the same as have been employed for many years. Several small improvements have been introduced as to better inking of the rollers for colour work, and better heating of the blocks used for gold work. A blocking press is now, in consequence of the size of many of the blocks, a large and cumbersome machine. The block itself is fixed firmly in a strong metal bed, and a movable table in front of it is fitted with gauges which keep the cover exactly in its right place. For gold work the block is kept at the proper temperature by means of gas jets, and the cover being properly overlaid with gold leaf is passed, on its table, directly under the block and then pressed steadily upwards against it, lowered, drawn out, and the superfluous gold rubbed off. The same process is followed in the case of colour blocks, only now the block need not be heated, but is inked by means of a roller for each impression. A separate printing is necessary for each colour. These printings always require great care on the part of the operator, who has to watch the working of each pull very carefully, and if any readjustment is wanted, to make it at once, so that it is difficult to estimate at what rate they can be made. In the matter of gold blocking there must be great care exercised in the matter of the heat of the block, for if it is too hot the gold will adhere where it is not wanted, and if too cool it will not adhere where it is required. Great nicety is also necessary as to the exact pressure required as well as the precise number of moments during which the block should be in contact with the gold, which is fastened to the cloth or leather by means of the solidification by heat of egg albumen. Blocking presses are mainly of German make, but Scottish and English presses are also largely used.

Book Illustration. See ILLUSTRATION.

Book-plates.—The value attached to book-plates, otherwise than as an object of purely personal interest, is comparatively modern. The study of, and the taste for collecting, these private tokens of book-ownership hardly date farther back than a quarter of a century. Since then the book-plate, or *ex-libris* (to use a jargon term that is now finding its way into dictionaries), has become fully recognized as a small but attractive offshoot of the general subject of bibliography. As a matter of fact, the book-plate, or printed label intended to indicate ownership in individual volumes, is nearly as old as the printed book itself. It bears very much the same relation to the hand-painted armorial or otherwise symbolical personal device found in mediæval manuscripts that the printed page does to the scribe's work. The earliest known examples of book-plates are German. According to Friedrich Warnecke, of Berlin (one of the best authorities on the subject), the oldest movable *ex-libris* yet brought to light are certain woodcuts representing a shield of arms supported by an angel (Fig. 1), which were pasted in books presented to the Carthusian monastery of Buxheim by Brother Hildebrand Brandenburg of Biberach, about the year 1480—the date

being fixed by that of the recorded gift. The woodcut, in imitation of similar devices in old MSS., is hand

FIG. 1.—Gift-plate of Hildebrandt Brandenburg of Biberach to the Monastery of Buxheim. Circa 1480.

painted. In France the most ancient *ex-libris* as yet discovered is that of one Jean Bertaud de la Tour-Blanche, the date of which is 1529; and in England

*N. Bacon eques auratus & magni
sigilli Angliae Custos librum hunc bi-
bliothecae Cantabrig. dicit.*

1574.

FIG. 2.—Book-plate of Sir Nicholas Bacon.

that of Sir Nicholas Bacon, a gift-plate for the books he presented to the University of Cambridge (Fig. 2). Holland comes next with the plate of a certain Anna van

der Aa, in 1597; then Italy with one attributed to the year 1622. The earliest known American example is the plain printed label of one John Williams, 1679.

A sketch of the history of the book-plate, either as a minor work of symbolical and decorative art, or as an accessory to the binding of books, must obviously begin in Germany, not only because the earliest examples known are German, but also because they are found in great numbers long before the fashion spread to other countries, and are often of the highest artistic interest. Albert Dürer is known to have actually engraved at least six plates (some of very important size) between 1503 and 1516 (Fig. 3), and to have supplied designs for many others. Several notable plates are ascribed to Lucas Cranach and to Hans Holbein, and to that bevy of so-called "Little Masters," the Behams, Virgil Solis, Matthias Zundt, Jost Amman, Saldörfer, Georg Hüpschmann, and others. The

FIG. 3.—Book-plate of Lazarus Spengler, by Albert Dürer (1515).

influence of these draughtsmen over the decorative styles of Germany has been felt through subsequent centuries down to the present day, notwithstanding the invasion of successive Italian and French fashions during the 17th and 18th centuries, and the marked effort at originality of composition observable among modern designers. The heavy, over-elaborated German "style" never seems to have invaded neighbouring countries; but since it was undoubtedly from Germany that was spread the fashion of using ornamental book-plates as marks of possession, the history of German *ex-libris* remains on that account one of high interest to all those that are curious in the matter.

It was not before the 17th century that the *movable ex-libris* became tolerably common in France. Up to that time the more luxurious habit of stamping the cover with a personal device had been in such general favour with book-owners as to render the use of labels super-

fluous. From the middle of the century, however, the *ex-libris* proper became quite naturalized; examples of that period are very numerous, and, as a rule, are very handsome. It may here be pointed out that the expression *ex-libris*, used as a substantive, which is now the recognized term for book-plate everywhere on the Continent, found its origin in France. The words only occur in the

FIG. 4.—Book-plate of P. A. Convers, 1762.

personal tokens of other nationalities long after they had become a recognized inscription on French labels.

In many ways the consideration of the English book-plate, in its numerous "styles," from the late Elizabethan to the late Victorian period, is peculiarly interesting. In all its varieties it reflects with great fidelity the prevailing taste in decorative art at different epochs. Of English examples, none thus far seems to have been discovered of older date than the gift-plate of Sir Nicholas Bacon; for the celebrated, gorgeous, hand-painted armorial device attached to a folio that once belonged to Henry VIII., and now reposes in the King's Library, British Museum, does not come under the head of book-plate in its modern sense. The next is that of Sir Thomas Tresham, dated 1585. Until the last quarter of the 17th century the number of authentic English plates is very limited. Their composition is always remarkably simple, and displays nothing of the German elaborateness. They are as a rule very plainly armorial, and the decoration is usually limited to a symmetrical arrangement of mantling, with an occasional display of palms or wreaths. Soon after the Restoration, however, a book-plate seems to have suddenly become an established accessory to most well-ordered libraries. Book-plates of that period offer very distinctive characteristics. In the simplicity of their heraldic arrangements they recall those of the previous age; but their physiognomy is totally different. In the first place, they invariably display the "tincture" lines and dots, after the method originally devised in the middle of the century by Petra Sancta, the author of *Tesseræ Gentilitiæ*, which by this time had become adopted throughout Europe. In the second, the mantling assumes a much more elaborate appearance—one that irresistibly recalls that of the periwig of the period—surrounding the face of the shield. This style was undoubtedly imported from France, but it assumed a

character of its own in England. As a matter of fact, thenceforth until the dawn of the French Revolution, English modes of decoration in book-plates, as in most other chattels, follow at some years' distance the ruling French taste. The main characteristics of the style which prevailed during the Queen Anne and early Georgian periods are:—ornamental frames suggestive of carved oak, a frequent use of fish-scales, trellis, or diapered patterns, for the decoration of plain surfaces; and, in the armorial display, a marked reduction in the importance of the mantling. The introduction of the scallop-shell as an almost constant element of ornamentation gives already a foretaste of the *Rocaille-Coquille*, the so-called "Chippendale" fashions of the next reign. As a matter of fact, during the middle third of the century this "Rococo" style (of which the *Convers* plate (Fig. 4) gives a tolerably typical sample) affects the book-plate as universally as all other decorative objects. Its chief element is a fanciful arrangement of scroll and shell work with curveting acanthus-like sprays—an arrangement which in the examples of the best period is generally made asymmetrical in order to give freer scope for a variety of countercurves. Straight or concentric lines and all appearances of flat surface are studiously avoided; the helmet and its symmetrical mantling tends to disappear and is replaced by the plain crest on a "fillet." The earlier examples of this "Chippendale" manner are tolerably ponderous and simple. Later, however, the composition becomes exceedingly light and complicated; every conceivable and often incongruous element of decoration is introduced, from cupids to dragons, from flowerets to Chinese pagodas. During the early part of George III.'s reign there is a return to greater sobriety of ornamentation, and a style more truly national, which may be called the "Urn" style, makes its

FIG. 5.—Book-plate of Francis Gwyn of Lansanor, 1698.

appearance. Book-plates of this period have invariably a physiognomy which at once recalls the decorative manner made popular by architects and designers such as Chambers, the Adams, Josiah Wedgwood, Hepplewhite, and Sheraton. The shield shows a plain spade-like outline, manifestly based upon that of the pseudo-classic urn then so much to the fore. The ornamental accessories are symmetrical palms and sprays, wreaths and ribbands. The architectural "boss" is also an important factor. In many plates, indeed, the shield of arms takes quite a subsidiary

position by the side of the predominantly architectural urn. From the beginning of the 19th century, until comparatively recent days, no special style of decoration seems to have established itself. The immense majority of examples display a plain shield of arms with motto on a scroll below, and crest on a fillet above. Of late years, however, a rapid impetus appears to have been given to the designing of *ex-libris*; a new era, in fact, has begun for the book-plate, one of great interest.

The main styles of decoration (and these, other data being absent, must always in the case of old examples remain the criteria of date) have already been noticed. It is, however, necessary to point out that certain styles of composition were also prevalent at certain periods. Many of the older plates (like the majority of the most modern ones) were essentially pictorial. Of this kind the best defined English genus may be recalled: the "Library

FIG. 6.—Book-plate of William Hewer, 1699.

Interior"—a term which explains itself—and "Book-piles," exemplified by the *ex-libris* (Fig. 6) of W. Hewer (Samuel Pepys's secretary). We have also many "Portrait-plates," of which, perhaps, the most notable are those of Samuel Pepys himself and of John Gibbs, the architect; "Allegories," such as were engraved by Hogarth, Bartolozzi, Pine, and George Vertue; "Landscape-plates," by wood engravers of the Bewick school (see Plate), &c. In most of these the armorial element plays but a secondary part.

Concerning the taste for collecting book-plates, it may be said that it originated in England. The first impetus was given to it by the appearance of the *Guide* by the late Lord de Tabley (then the Hon. Leicester Warren) in 1880. This work, highly interesting from many points of view, established what is now accepted as the general classification of "styles": "Early Armorial" (*i.e.*, previous to Restoration, exemplified by the Nicholas Bacon plate); "Jacobean," a somewhat misleading term, but distinctly understood to include the heavy decorative manner of the Restoration, Queen Anne, and early Georgian days (the Lansanor plate, Fig. 5, is typically "Jacobean"); "Chippendale" (the style above described as *Rococo*, tolerably well represented by the French plate of Convers); "Wreath and Ribbon," belonging to the period described as that of the "Urn," &c. Since then the literature on the subject has grown considerably. Societies of collectors have

been founded, first in England, then in Germany and France, and in the United States, most of them issuing a "Journal" or "Archives:" *The Journal of the Ex-libris Society* (A. and C. Black, London), the *Archives de la société française de collectionneurs d'ex-libris* (Paris), both of these monthlies; the *Ex-libris Zeitschrift*, Berlin, a quarterly.

Much has been written for and against book-plate collecting. If, on the one hand, the more enthusiastic "ex-librists" (for such a word has actually been coined) have made the somewhat ridiculous claim of "science" for "ex-librisme," the bitter animadversion, on the other, of a certain class of intolerant bibliophiles upon the "vandalism" of removing book-plates from old books has at times been rather extravagant. Book-plates are undoubtedly very often of high interest (and of a value often far greater than the odd volume in which they are found affixed), either as specimens of bygone decorative fashion or as personal relics of well-known personages. There can be no question, for instance, that engravings or designs by artists such as Holbein and Dürer and the "Little Masters" of Germany, by Eisen, Gravelot, Chodowiecki, or Gribelin; by W. Marshall, Faithorne, David Loggan, Sir Robert Strange, Piranesi; by Hogarth, Cipriani, Bartolozzi, Sherwin, Henshaw, Hewitt, or Bewick and his imitators; or, to come to modern times, that the occasional examples traced to the handicraft of Thomas Stothard, Thackeray, Millais, Maclise, Bell Scott, T. G. Jackson, Walter Crane, Caldecott, Stacy Marks, Edwin Abbey, Kate Greenaway, Gordon Browne, Herbert Railton, Aubrey Beardsley, Alfred Parsons, D. Y. Cameron, Paul Avril—there can indeed be no doubt that these things are worth collecting.

Until the advent of the new taste the devising of book-plates was almost invariably left to the routine skill of the heraldic stationer. Of late years the composition of personal book-tokens has become recognized as a minor branch of a higher art, and there has come into fashion an entirely new class of designs which, for all their wonderful variety, bear as unmistakable a character as that of the most definite "styles" of bygone days. Broadly speaking, it may be said that the purely heraldic element tends to become subsidiary and the allegorical or symbolic to assert itself more strongly. Among modern English artists who have more specially paid attention to the devising of book-plates and have produced admirable designs, may be mentioned C. W. Sherborn, G. W. Eve, Robert Anning Bell, J. D. Batten, Erat Harrison, J. Forbes Nixon, Charles Ricketts, John Vinycomb, John Leighton, and the late Warrington Hogg. The development in various directions of "process" work, by facilitating and cheapening the reproduction of beautiful and elaborate designs, has no doubt helped much to popularize the book-plate—a thing which in older days was almost invariably restricted to ancestral libraries or to collections otherwise important. Thus the great majority of modern plates are reproduced by "process." There are, however, a few artists left who devote to book-plates their skill with the graver. Some of the work they produce challenges comparison with the finest productions of bygone engravers. Of these the best known are C. W. Sherborn (see Plate) and G. W. Eve in England, and in America E. D. French of New York City (see Plate). The process work which it has been necessary here to employ in reproducing book-plates of this kind cannot render justice to the exquisiteness of their treatment.

The curious in the matter of book-plate composition will find it treated in the various volumes of the *Ex-libris Series* (London: George Bell and Sons); and almost every other item of information in the following works:—

Book-Printing.—The latest development in printing, in which each component of a book is controlled by a sense of harmony and beauty, owes its conception and realization to William Morris, and takes definite form in the founts and books of the Kelmscott Press. Previous efforts by Morris himself, Mr Daniel of Oxford, and others, count only as experiments towards a tasteful use of material to hand. The great originality of the Kelmscott books lies, not merely in the order and design shown in their "build" and decoration, but in the vivifying of each part from type to paper by a high order of design and execution. Herein they differed in 1891 in all essentials, and in many new particulars, from all other modern books both in aim and aspect.

The *Kelmscott Press* is distinguished by the use of three founts designed by William Morris. The Troye and Chaucer founts, both of them Gothic, named after books in which they first appeared, are best fitted for ornamented mediæval works. These books owe their chief interest to the bold and handsome decoration by Mr Morris, and to woodcuts after designs by Sir Edward Burne-Jones; one of the most noteworthy examples is the "Chaucer," of a page of which we are, by the special permission of William Morris's trustees, enabled to give a reduced facsimile (p. 307). In Swinburne's *Atalanta in Calydon* we note the partial failure of this order of type to fit the character of a modern book. In the Golden or Roman fount lie the strength and future of the Kelmscott Press as an influence on type. The Golden type is without the exaggerated contraction of form laterally, the exaggerated use of thick and thin strokes, or the vicious stroke-terminations common to modern founts. It is a type of full body, designed in careful relation to the up-and-down strokes, and resting upon solid serifs, as with Jenson, for instance, but in detail more allied to fine penmanship or even black letter. The character of the decoration in the Kelmscott pages is stamped with the vigour which one expects from a designer of Morris's importance. Usually on a black ground, the forms combine a northern character in thistle leaf and composite flower, with a fluency of curve comparable to the famous borders of Ratdolt of Venice.

The *Vale* books, often classed by writers and collectors with the Kelmscott, may be counted with them so far as they also are singular in being controlled by one designer, from the important matter of type, decoration, and illustration, to that of "build" and press-work. The first *Vale* book in which each of these conditions was achieved is *Milton's Minor Poems* (1896). In this the Roman type, known as the *Vale* fount, designed by Charles Ricketts, differs from the Venetian and Kelmscott founts by a greater roundness or fulness of body, and in a modification of details by the conditions of type-making. The second fount used in the *Vale* issues, first employed in *The Plays of Shakespeare* (1896), is less round in body, more traditional in detail, and lighter in effect. To be mentioned with the foregoing are some half-dozen books, printed by L. Pissarro in the *Vale* fount at his press, "The Eragny Press," with woodcut decorations. They are unique in the revival of printing by the occasional use of colours and gold.

No other books have hitherto combined the conditions specified of new type, woodcut decoration, original woodcuts, and personal control. Two American founts, adapted from Morris, are tentatively used by publishers. Mons. Grasset, in France, has designed an eclectic fount, but none of these can be associated with a special press or series of notable books. Recently, however, Messrs. Sanderson and Walker have recut Jenson's fount and established the *Doves Press*, conspicuous for its taste and technical excellence.

A certain number of technical conditions had to be faced in the revival of printing for the first time in late years, i.e., the printing of woodcuts on hand-made paper, and the printing of borders and initials in the body of the text; both in pitch and in sustained evenness of tone the Kelmscott Press (notably in the Chaucer) remains unsurpassed. The inking-up process employed to achieve the above conditions is a very gradual one. The paper chosen for its regular thickness is, moreover, slightly damped,

to avoid a gritty aspect in the blacks; hence the delicate embossed appearance of the pages, and the absence of all overloading with ink. In the manipulation of English or "Roman" vellum the consistency of the inks used is even greater, the vellum, of course, not being damped. The so-called "Roman" vellum is made at Brentford. The vellum used for the Kelmscott *Chaucer* was damped.

AUTHORITIES.—Articles on the revival have appeared in the *Athenæum*, the *Saturday Review*, *Magazine of Art*, *The Studio*, and the *Contemporary Review*. More detailed and more accurate information will be found in *A Note by William Morris on his Aims in founding the Kelmscott Press*. Boom, a town of Belgium, in the province, and 10 miles S. by rail, of Antwerp. Its numerous manufactures include boat-building, sail-making, and extensive brewing. Population (communal) (1880), 12,657; (1897), 14,971.

Boone, capital of Boone county, Iowa, U.S.A., situated on Des Moines river, near the centre of the state, at an altitude of 1134 feet. Two railways cross here, the Chicago and North-Western, and the Des Moines, Northern and Western. Population (1880), 3330; (1900), 8880.

Booth, Charles (1840—), English sociologist, was born at Liverpool on 30th March 1840, and has been since 1862 a partner in Alfred Booth and Company, a Liverpool firm engaged in the Brazil trade. He has for many years past devoted his time, and no inconsiderable sums of money, to inquiries into the statistical aspects of social questions. The results of these are chiefly embodied in a work entitled *Life and Labour of the People in London*, of which the earlier portion appeared under the title of *Life and Labour* in 1889. The nine volumes that have appeared deal only with East, Central, and Southern London. The book is designed to show "the numerical relation which poverty, misery, and depravity bear to regular earnings and comparative comfort, and to describe the general conditions under which each class lives." It contains a most striking series of maps, in which the varying degrees of poverty are represented street by street, by shades of colour. The data for the work were derived in part from the detailed records kept by school-board "visitors," partly from systematic inquiries directed by Mr. Booth himself, supplemented by information derived from relieving officers and the Charity Organization Society. Mr. Booth has also paid much attention to a kindred subject—the lot of the aged poor. In 1894 he published a volume of statistics on the subject, and, in 1891 and 1899, works on "Old Age pensions," his scheme for the latter depending on a general provision of pensions of five shillings a week to all aged persons, irrespective of the cost to the State.

Booth, Edwin (Thomas) (1833-1891), the most famous of American tragic actors, was born in Harford county, Maryland, 13th November 1833. His father, Junius Brutus Booth (1796-1852), was an elevated and powerful, if erratic, English tragedian who had emigrated to the United States. Edwin's first regular appearance was in 1849 as Tressel in "Richard III.," and he early played Wilford in "The Iron Chest." He was a youthful Apollo, lithe and graceful in figure, buoyant in spirits. His dark hair fell in waving curls across his brow, and his glowing eyes were soft and luminous, and most expressive. His father watched him with great interest, but with evident disappointment, and the members of the theatrical profession, who held the acting of the elder Booth in great reverence, seemed to agree that the genius of the father had not descended to the son. It was not until after his parent's death that the son showed any histrionic talent. Between 1852 and 1856 he played in California, Australia,

I have no wommen suffisaunt certayn
The chambres for tarraye in ordinaunce
After my lust, and therfore wolde I fayn
That thyn were al swich manere governaunce;
Thou knowest eek of old al my plesaunce;
Thogh thyn array be badde and yvel biseye,
Do thou thy devoir at the leeste weye.

NOT doonly, lord, that I am glad, quod she,
To doon youre lust, but I desire also
Yow for to serve and plesse in my degree
Withouthen feynting, and shal everemo;
Ne nevere, for no wele ne no wo,
Ne shal the goost withinne myn herte stente
To love yow best with al my trewe entente.

And with that word she gan the hous to
dighte,
And tables for to sette and beddes make;
And peyned hire to doon al that she myghte,
Preyngge the chambereres for Goddes sake
To hasten hem, and faste swepe and shake;
And she, the mooste servysable of alle,
Bath every chambre arrayed and his halle.

ABOUTEN undren gan this eryl alighte,
That with him broghte thise noble
children tweye,
for which the peple ran to seen the sighte

Of hire array, so richely biseye;
And thanne at erst amonges hem they seye,
That Walter was no fool, thogh that hym leste
To chaunge his wyf, for it was for the beste.

for she is fairer, as they deemen alle,
Than is Grisilde, and moore tendre of age,
And fairer fruyt bitwene hem sholde falle,
And moore plegant, for hire heigh lynage;
His brother eek so faire was of visage,
That hem to seen the peple hath caught
pleasaunce,
Commendynge now the markys governaunce.

Auctor

STORMY peple! unsad and
evere untrewel!
Hy indiscreet and chaungynge
as a vane,
Delitynge evere in rumbul that
is newe,

for lyk the moone ay wexe ye and wane;
Hy ful of clappyng, deere ynogh a jane;
Youre doom is fals, youre constance yvele
preeveth,
A ful greet fool is he that on yow leeveth!

Thus seyden sadde folk in that citee
Whan that the peple gazed up and down,

and the Sandwich Islands, and those who had known him in the East were surprised when the news came that he had captivated his audiences with his brilliant acting. From this time forward his dramatic triumphs were warmly acknowledged. There was no dissenting voice. His Hamlet, Richard, and Richelieu were pronounced to be superior to the performances of Edwin Forrest. In 1862 he became manager of the Winter Garden Theatre, New York, where he made a series of Shakespearean productions of then unexampled magnificence (1864-67), including "Hamlet," "Othello," and "The Merchant of Venice." In 1868-69 he built a splendid theatre of his own—Booth's Theatre—and organized a stock company. The company was headed by such actors as Edwin Adams, Lawrence Barrett, Edwin L. Davenport, and J. W. Wallack, Jr., and was of extreme excellence. It gave splendid productions of "Romeo and Juliet," "The Winter's Tale," "Julius Cæsar," "Macbeth," "Much Ado about Nothing," "The Merchant of Venice," and others. In all cases Booth used the original text of Shakespeare, thus antedating by many years a similar reform in England. Besides this, Booth's theatre presented a series of attractions by the leading actors and companies of the United States. Almost invariably his ventures were successful; but he was of a generous and confiding nature, and his management was not economical. In 1874 the grand dramatic structure he had raised was taken from him, and with it went his entire fortune. By arduous toil, however, he again accumulated wealth, in the use of which his generous nature was shown. He converted his spacious residence in Gramercy Park, New York, into a club—The Players'—for the elect of his profession, and for such members of other professions as they might choose. The house, with all his books and works of art, and many invaluable mementos of the stage, became the property of the club. A single apartment he kept for himself. In this he died on 7th June 1891. Among his parts were Macbeth, Lear, Othello, Iago, Shylock, Wolsey, Richard II., Richard III., Benedick, Petruccio, Richelieu, Sir Giles Overreach, Brutus (Payne's), Bertuccio (in Tom Taylor's "The Fool's Revenge"), Ruy Blas, Don Cesar de Bazan, and many more. His most famous part was Hamlet, for which his extraordinary grace and beauty and his eloquent sensibility peculiarly fitted him. He probably played the part oftener than any other actor before or since. He visited London in 1851, and again in 1880 and in 1882, playing at the Haymarket Theatre with brilliant success. In the last year he also visited Germany, where his acting was received with the highest enthusiasm. His last appearance was in Brooklyn as Hamlet in 1891.

Edwin Booth's prompt books were edited by William Winter, 1878. In a series of volumes, *Actors and Actresses of Great Britain and America*, edited by Lawrence Hutton and Brander Matthews, Edwin Booth contributed recollections of his father, which contain much valuable autobiographic material. For the same series Lawrence Barrett contributed an eloquent article on Edwin Booth. *Life and Art of Edwin Booth*, by WILLIAM WINTER, 1893. *Edwin Booth*, by LAWRENCE HUTTON, 1893.

(J. J. *)

Booth, William (1829—), founder of the Salvation Army, was born at Nottingham on 10th April 1829. At the age of 15 his mind took a strongly religious turn, under the influence of the Wesleyan Methodists, in which body he became a local preacher in the year following. In 1849 he came to London, where, according to his own account, his passion for open-air preaching caused his severance from the Wesleyans. Joining the New Connexion, he was ordained a minister, but not being employed as he wished in active "travelling evangelization," left that body also. During this period he had married, and had now a family of four children.

Both he and his wife occupied themselves with preaching, first in Cornwall and then in Cardiff and Walsall. At the last-named place was first organized a "Hallelujah band" of converted criminals and others, who testified in public of their conversion. In 1864 William Booth went to London and continued his services in tents and in the open air, and founded a body which was successively known as the *East London Revival Society*, the *East London Christian Mission*, the *Christian Mission*, and (in 1878) the *Salvation Army*. The Army operates (1) by holding meetings out of doors, and marching singing through the streets, in harmony with law and order; (2) by visiting public-houses, gin-palaces, prisons, private houses, and speaking to and praying with all who can be got at; (3) by holding meetings in theatres and the other common resorts of those who prefer pleasure to God, and turning factories and other strange buildings into meeting-rooms; (4) by using the most popular song-tunes and the language of everyday life, &c.; (5) by making every convert a daily witness for Christ, both in public and private. The Army is divided into a quasi-military organization, and Booth modelled its "Orders and Regulations" on those of the British army. The "campaigns" of the Army excited violent opposition, a "Skeleton Army" being organized to break up the meetings, and for many years Booth's followers were subjected to fine and imprisonment as breakers of the peace. Since 1889, however, these disorders have been little heard of. The operations of the Army were extended in 1880 to the United States, in 1881 to Australia, and have since spread to the Continent, to India, Ceylon, and elsewhere. The wife of Mr Booth (née Kate Mumford), whom he married in 1855, was actively associated with him in his work, more especially in preaching. In 1859 she published a pamphlet, entitled *Female Teaching*, in defence of women as preachers. Mrs Booth died in 1890. In 1890 Mr Booth attracted public attention by the publication of a work entitled *In Darkest England, and the Way out*, in which he proposed to remedy pauperism and vice by a series of ten expedients: (1) the city colony; (2) the farm colony; (3) the over-sea colony; (4) the household salvage brigade; (5) the rescue homes for fallen women; (6) deliverance for the drunkard; (7) the prison gate brigade; (8) the poor man's bank; (9) the poor man's lawyer; (10) Whitechapel-by-the-sea. The scheme was much criticized, and has not been fully carried out, though a very large amount of money, for which Mr Booth appealed to the public, was subscribed to start it. In the year ending 30th September 1899 the Salvation Army possessed 68,000 "officers"; and £52,000 was subscribed in Great Britain alone for its operations (apart from the "Darkest England" scheme).

Boothia, or **BOOTHIA FELIX**, a peninsula of Franklin district, British North America, is situated between 69° 30' and 72° N. lat. and 91° 30' and 97° W. long. It includes an area of 13,100 square miles.

Boothia Gulf, in the Arctic ocean, situated between 85° and 94° W. long. and 67° and 72° N. lat., separates the north-western portion of Baffin Land and Melville Peninsula from Boothia Peninsula. It is connected with Lancaster Sound by Prince Regent Inlet, with Franklin Strait by Bellot Strait, and with Fox Channel by Fury and Hecla Strait. The principal bays are Committee and Pelly in the southern portion, and Lord Mayor in the western.

Boppard, a town of Prussia, in the Rhine province, on the left bank of the Rhine, 12 miles S. of Coblenz, is an old town in part surrounded by mediæval fortifications. Noteworthy buildings are the parish church (12th and 13th centuries); the Carmelite church (1318); the

former castle, now administrative offices; the Evangelical church (1851, enlarged 1887); the hydropathic Marienberg (1839), occupying a former Benedictine abbey, which crowned a hill 100 feet above the Rhine. Population (1900), 5806.

Borås, a town of Sweden, province Elfsborg, 36 miles E. of Gothenburg by rail, on the river Wiske, with numerous cotton spinning and weaving mills. It was founded by Gustavus Adolphus in 1632, and has a mineral spring. Population (1880), 4723; (1898), 13,772.

Bordeaux, capital of the department of Gironde, and metropolis of south-western France, 359 miles from Paris by rail. It is one of the finest cities of France, owing to its position on the left bank of the Garonne, its spacious quays, promenades, broad roads bordered with handsome buildings, and the animation of its streets and places of business. It is also rich in scientific institutions, which have recently taken new developments and acquired fine premises. The faculty of medicine and pharmacy, built between 1880 and 1888, is attended by 1200 students. The faculty of literature and science, built between 1881 and 1886, possesses the grave of Montaigne, one of the most celebrated inhabitants of the district, whose body was transported here. It also contains numerous laboratories, and an astronomical observatory adjoins it. Attached to the natural history museum is a prehistoric, anthropological and ethnographical museum, which has been furnished with valuable types by the grottos and caves of the Dordogne and Gironde. The Théâtre Louis, burnt in 1888, was replaced in 1890 by the Théâtre des Arts; and in 1893 the Olympia replaced the former Théâtre Français, burnt in 1855. A magnificent monument to commemorate the Girondists and in honour of the republic has been erected on the Place des Quinconces. The town of Bordeaux, formerly supplied by local wells and springs, acquired (1883-87) the spring of the Fontbannes, on the bank of the Ciron, thus securing a daily allowance of 40 gallons of water per head to 250,000 persons.

The works for the improvement of the port commenced during the Second Empire have been proceeded with. A vast wet dock with one mile of quayage, and capable of accommodating ships of 5000 tons has been excavated. The bed of the river has been dredged to admit vessels of 2000-2500 tons each. On the borders of the new quays and the wet dock powerful cranes are set in motion by compressed water. A long timber boom has been constructed opposite the city on the right bank, where are also the chief ship-building yards, from which have issued a large number of ships of the national fleet. In 1899, 10,041 vessels (coasting included) entered the port, and 10,169 cleared, with a total of 3,776,548 tons. The value of exports reached £14,564,000, that of imports £12,788,000. Wine forms the staple article of Bordeaux trade. Twenty-two millions of gallons in casks, and a million bottles are exported annually, to which must be added the quantity despatched by rail. The total amount of this export is 66,000,000 gallons. The chief lines of steamers connect Bordeaux with the West Coast of Africa, and with South America. The Basques who emigrated to Brazil and especially to La Plata, have established between France and those countries important relations. There is no part of the world which is not in regular communication with this important commercial port. Pine-wood is exported to England for the working of mines. The population of the town in 1886 was 225,281; in 1896, 239,806; in 1901, 257,471.

Bordentown, a borough of Burlington county, New Jersey, U.S.A., situated in 40° 08' N. lat., and 74° 43' W. long., on the east bank of Delaware river, 6 miles below Trenton, and on the Pennsylvania railway. It is the terminus of the Delaware and Raritan canal. Population (1880), 4258; (1900), 4110.

Bordighera, a winter resort of the province of Porto Maurizio, Liguria, Italy. It stands about midway between San Remo and Ventimiglia, 91 miles W. by S. of Genoa by rail. Bordighera consists of the New

Town, close down by the shore, the "Visitors' Town, on a gently rising plain behind it, backed by the Old Town and hills (600 to 1000 ft. in alt.). It is famous for its palms and other exotic plants, and grows large quantities of flowers and lemons for export. Amongst its "lions" are the Villa Bischoffsheim and the Villa Garnier, the latter with wall-paintings by French artists. The parish church dates from 1648, and was restored in 1886. There are two museums, one containing Roman antiquities found on the Ligurian coast, paintings by Italian artists of the 17th century, and natural history collections, the other containing botanical and ethnographical collections. Population, about 3500.

Borgerhout, a town of Belgium, in the province and 1 mile E. of the town of Antwerp, with a station on the railway between Antwerp and Brussels. Candles, cigars, and tobacco are among its manufactures. Its *Maison Communale*, completed in 1890, is one of the finest in the district of Antwerp. Population (communal) (1880), 20,268; (1897), 33,419.

Borgo, a town of Finland, 33 miles by rail N.E. of Helsingfors, situated on a river of the same name, at its entrance into a bay of the Gulf of Finland. It was here that the Chamber of Deputies framed, in 1802, the constitution of Finland. Trade, which is chiefly in furs, leather, &c., is hindered by the shallowness of the bay. Population, 4420.

Borgo San Sepolchro, a town and episcopal see of the province of Arezzo, Tuscany, Italy, 29 miles N.E. of Arezzo on the railway to Ancona, and on the river Tiber. It stands at the foot of Monte Maggiore, and is still surrounded by mediæval town walls. Its chief claim to notice is as the birthplace of Piero della Francesca, Raffaello dal Colle, and Gherardi, whose paintings adorn the cathedral and other churches, the town picture-gallery, a large hospital (dating from 1466), and the Collacchioni house. A monument to the first named was erected in the public gardens in 1892. There is a technical school, and woollens are manufactured. Population of commune, about 8300; of town, about 3700.

Borgu. See NIGERIA.

Borisov, a district town of Russia, government and 50 miles N.E. of Minsk. It is a very old town, mentioned in the 12th century. It was annexed to Russia after the first partition of Poland, and is famous for a battle fought in 1812, which compelled Napoleon I. to make the disastrous passage of the Berezina. Population, 14,900.

Borisovka, a village of Middle Russia, government of Kursk, near the Kursk to Kharkov railway, 32 miles from Byelgorod railway station. It has developed rapidly with the extension of the railway, and has a steam flour-mill, and many tanneries, and carries on a lively business in corn, hides, leather, and holy pictures. Population, 16,420.

Borku. See SAHARA.

Borkum, an island and summer resort of Prussia, the westernmost of the (German) East Frisian chain, lying between the E. and W. arms of the estuary of the Ems, and opposite to the Dollart. It belongs to the province of Hanover, and is visited by some 14,000 persons annually. The island affords pasture for cattle, and is a breeding-place for sea-birds. In the village of Borkum there are a couple of lighthouses, a Reformed church (1897), and a Roman Catholic chapel. Population, about 1350.

Bormio, an Alpine resort of the province of Sondrio, Lombardy, Italy, 35 miles N.E. of Sondrio. It stands at an altitude of 4380 ft. on the Adda and at the

mouth of the Turva valley, but enjoys a July mean temperature of 59°. Its mineral springs and baths were known to the Romans, and were frequented all through the Middle Ages. Their water is saline, with a temperature of 98.6° to 107.6°, and is used for drinking, as well as in mud baths, spray baths, steam baths, etc. In the Turva valley are the ferruginous springs and baths of Santa Caterina, 5801 ft. above sea-level. The village of Bormio is two miles below the baths. Population of commune, about 2000.

Borna, a town of Germany, on the Wirha emptying into the Pleisse, 17 miles S. by E. by rail of the town and in the circle of Leipzig, kingdom of Saxony. The industries include peat-cutting, iron-foundries, organ, pianoforte, felt, and shoe factories. Population (1890), 7485; (1900), 8422.

Borneo, next to New Guinea the largest island in the world, is situated about the middle of the East Indian archipelago, and extends from 7° N. to 4° 20' S. lat., and from 108° 53' to 119° 22' E. long. It is some 750 miles long by 600 miles' maximum breadth; its area, according to the more correct calculations of the Topographical Bureau at Batavia (1894), comprises 293,496 square miles. The highest mountain chains and plateaus in the centre are formed of granite and crystalline schists—the oldest formations of the island—varying with sandstone and grauwacke. The surrounding coasts of the Borneo of that age, broken in all probability into a number of islands occupying a much smaller area than does the present island, were a Tertiary deposition, buttressed with the debris of the older formations borne down by rivers and with the chalk of foraminifera and corals. Bordering the mountain chains and plateaus, the hills of Borneo are formed of Tertiary strata with their eruptive rocks (andesite and basalt). More recent formations, the diluvium, still embedding in it abundant platinum, diamonds, and metals of the primary formation, and the alluvium of sea and rivers, next filled up gulfs, bays, and basins of the earlier Borneo, spread out its coasts, built up its higher and lower plains, and thus pieced out the island to its modern dimensions. The explorations of Professor Molengraaff have proved that there is no proper nucleus of mountains whence chains ramify in different directions. The centre, however, of the island is occupied by three mountain chains and a plateau, namely—1st. The folded chain of the Upper Kapuas, dividing the western division of Dutch Borneo from Sarawak, extending W.S.W. to E.N.E., ending probably in Beru, and attaining near the sources of the Kapuas a height of 5500 to 6000 feet. To this chain belongs the plateau of the Baram river. 2nd. The Schwaner plateau, south of the Kapuas, with summits ranging from 3000 up to 7500 feet in the Bukit Raja, a plateau dividing the waters of the Kapuas from the rivers of South Borneo. 3rd. The high plateau of Madi (3000 to 4000 feet), clothed with tropical high fens. 4th. The Müller chain of mountains, between the Madi plateau and the Kapuas chain, a volcanic region presenting heights that were once active volcanoes, such as Bukit Terata (4700 feet), long extinct. The chains and plateaus extend all in a W. to E. direction. They are homologous in structure with the mountains, not of Celebes or Halmahera, but of Malacca, Banka, and Billiton. Rimmed round with low alluvial lands, and resting on a submarine plateau of no great depth, the coasts of Borneo are marshy, sandy, sometimes of the character of sawahs, presenting cliffs or mudbanks to the sea, which round the shore has a maximum depth of but 1 to 3 fathoms. The coast offers, therefore, few accessible ports. The towns and seaports are to be found at such river mouths as are not barricaded by sandbanks or

mudbanks. All round the island there are but seven places at which the steamers of the Dutch Packet Company call—Pontianak, Banjarmasin, Kota Baru, Pasir, Samarinda, Beru, and Balungan. The rivers play a very important part in the economy of Borneo, as highways and as the lines along which run the main arteries of population. Within recent years the exploration of nearly all the larger rivers has been advanced. The most important are those having their outlet at the west coast: the Sambas, navigable in its lower course for vessels of 25 feet draught, and the Kapuas, of volume varying with the tide and the amount of rainfall, normally navigable by small steamers and praus of 4 to 5 feet draught for 300 to 400 miles, from Pontianak up to Sintang, and thence as far as Benut. The mid-part of this river, shallower and broader than in its lower course, gives rise to a region of inundations and lakes extending as far as the northern mountain-chain. Among its considerable tributaries may be mentioned the southern Melawi with its affluent the Pinuh. Of less importance in the way of commerce and navigation, but noticeable in the way of the political division of the country, are the Simpang, Pawan, and Kandawangan, with the chief native villages at their mouths or on the seaboard near by. The Rejang, a river of Sarawak, is navigable for over 100 miles. The southern rivers—Katingan, Kahayan or Great Dayak, the Kapuas Murung or Little Dayak, and the Barito—are waters of capacious drainage, the Kahayan basin having an area of 16,000 square miles, and the Barito of 38,000 square miles. These rivers are navigable for two-thirds of their course by larger steamers; but in many cases their mouths are barred by banks of sand or mud which cannot be cleared by ships of more than 8 or 9 feet draught. Most of the larger affluents of the Barito are, in the greater part of their course, also navigable. The largest river discharging at the east coast is the Kutei, which at a great distance from its mouth has still a depth of three fathoms, and in all its physical features is comparable with the Kapuas and the Barito.

Climate.—Throughout Borneo the temperature averages 78.8° to 80° Fahr., with very slight variations. The rainy W. (S.W. and N.W.) wind prevails at all the meteorological stations, not the comparatively dry S.E. wind. Even at Banjarmasin the N.W. wind brings an annual rainfall of 60 inches, against 33 inches of rain carried by the S.E. wind.

Minerals.—Since 1875, Dr Posewitz and mining engineers have more exactly defined the distribution of diamonds, gold, platinum, quicksilver, iron, tin, &c., and have discovered new mineral regions. The exploitation of the mines suffers, however, from inadequate means of export, the high duties payable to the native princes, the competition among the rival companies, and the often too limited quantities of minerals found in the mines. In West Borneo the production of gold during 1895-99 amounted to from one to two million florins annually. The Asahan mines of Orange Nassau and of Kutei yield some thousands of tons annually. In Sarawak a coal mine at Sadong yields nominally 130 tons daily, though now actually much less. Another coal mine at Brooketon yields 50 tons daily, an output which cannot but increase indefinitely. It is only now that a serious attempt is being made to work the mineral oil known to exist in Sarawak. The Borneo Company are working gold mines in Upper Sarawak under a large staff of Europeans, and the mines are known to offer good prospects.

Fauna and Flora.—Animals of economic value are the sea-swallows, whose edible nests are prized as the best in the archipelago; bees yielding wild wax; the elephant; the civet; the ciawan, a species of fish found in the rivers and valued for its spawn, which is salted; the turtle; and the trepang, &c. Pearl-shell is also of commercial importance. Besides the ordinary products of the forests, rice is cultivated near the rivers and lakes and on ladangs in the forests; sugar-cane of superior quality in Sambas and Montrado; cotton on the banks of the Negara (a tributary of the Barito), sometimes exported in small quantities. Indigo, coffee, and pepper have been cultivated since 1855 in the western division of Dutch Borneo, and tobacco in both the eastern and western divisions, but rarely by Europeans, and of small commercial value.

Population.—The political division of Borneo is as follows:—

	Population.
Dutch Borneo . . .	1,180,580
British N. Borneo . . .	175,000
Sarawak . . .	500,000
Brunei . . .	25,000
Total . . .	1,880,580

Dutch Borneo.—Dutch Borneo is divided into two parts—the western, and the south and eastern division. The (estimated) population in each of the two divisions and their distribution according to races in 1896 were:—

Division.	European.	Chinese.	Arabs.	Other Oriental Foreigners.	Natives.	Total.
Western	302	37,735	1542	437	330,759	370,775
S. and Eastern	598	4,542	1534	116	803,015	809,805

In both divisions there is an average density of about 1 to every 2 square miles. The sparseness of population throughout the whole of the Dutch territory is due in part to the physical character of the country, but in part also to historic causes: the prejudicial influence in earlier times of Malayan, Arabian, Chinese, and Buginese colonists; to wars, piracy, and head-hunting, now suppressed by the Dutch Government. Among the natives, nomadic life in the wide forests, poverty, insufficient nourishment, feasts and other injurious habits, have contributed to the mortality. In Sambas, Montrado, and some parts of Pontianak, the greater density of population is due to the greater fertility of the soil, the opening of mines, the navigation and trade plied on the larger rivers, and the concentration of population at the junctions of rivers, the mouths of rivers, and the seats of government. Pontianak has about 9000 inhabitants; Sambas, 8000 to 9000; Montrado, Mampawa, Landak, between 2000 and 4000. In the south and eastern division, in Amuntai and Martapura, Hindu colonization, the fertile soil, navigable rivers, and trade and industry have co-operated towards the growth of a population, in marked contrast with that in the interior parts of the Upper Barito and of the more westerly rivers.

Only a very small part of the Europeans in Dutch Borneo live by agriculture and industry; the great majority of them belong to the Civil Service. The Arabs and Chinese are engaged in trading, shipping, mining, fishing, and agriculture. Of the natives 90 per cent. live by agriculture. Their industries are confined to the ordinary native crafts of spinning, weaving, and dyeing, the manufacture of iron agricultural implements, shipbuilding, &c. More particularly in the south-eastern division (in the districts of Negara, Banjarmasin, Amuntai, Martapura), shipbuilding, iron-forging, gold- and silver-smith's work, and the polishing of diamonds, are industries of high development in the larger centres of population: Banjarmasin, with 40,000 inhabitants; Marabahan, Amuntai, Negara, Samarinda, Tengarung, each with 5000 to 10,000 inhabitants.

BRITISH NORTH BORNEO OR SABAH¹

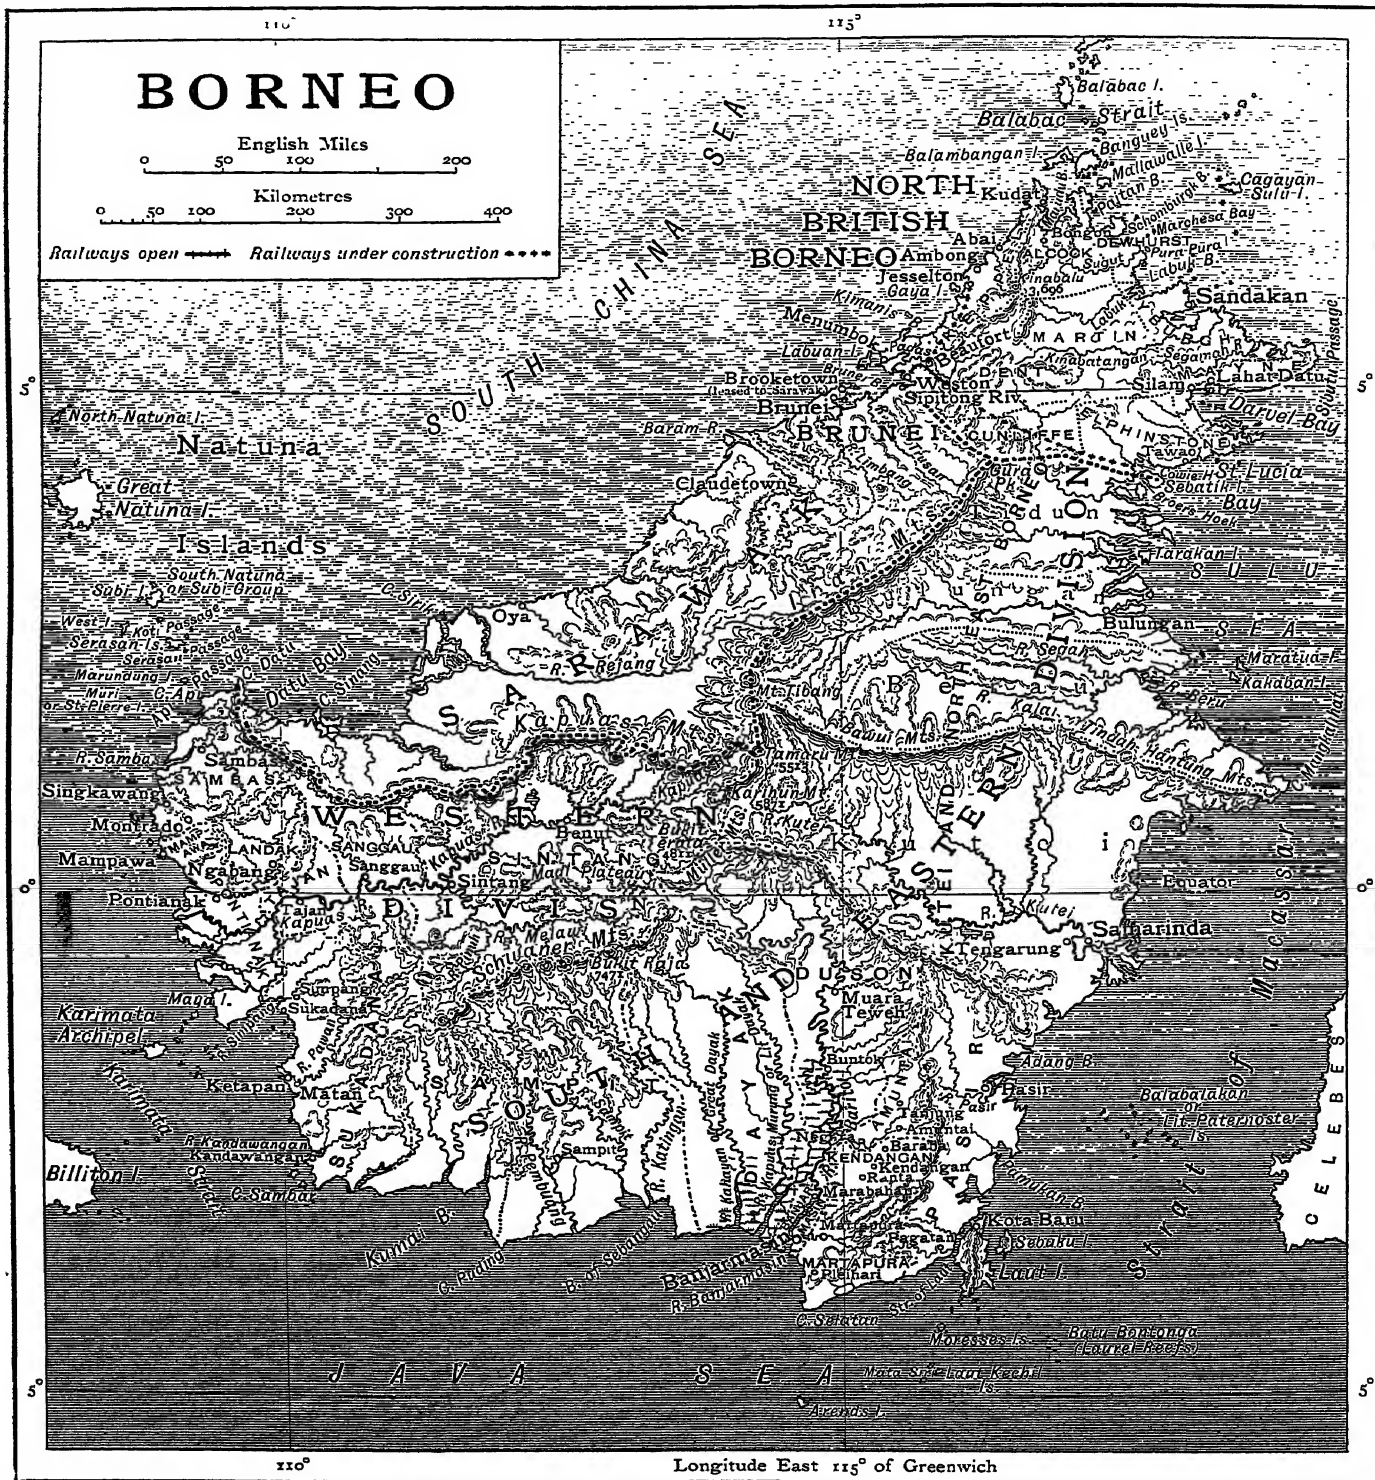

The State of North Borneo is the official term applied to the whole of that portion of the island of Borneo formally recognized by the Charter of Incorporation granted in November 1881 as the territory of the British North Borneo Company (see CHARTERED COMPANIES). It may roughly be said to form a pentagon, of which three sides, the north-west, north-east, and east sides are washed by the sea, while the remaining two sides, the west and the south, are bordered respectively by the independent Malayan Sultanate of Brunei, and by the territory of Dutch Borneo. The western boundary, with Brunei, is formed by a purely conventional line drawn from Gura Peak (3° 50' N. lat., 115° 10' E. long.), to the mouth of the river Sipitong on the west coast. The boundary between the Company's territory and that of Dutch Borneo is defined by a treaty concluded on 20th June 1891. It runs due east from Gura Peak to 115° 22' E. long., and thence in a north-easterly direction until the 116th meridian is reached on parallel 4° 20' N. lat.

¹ Sabah is the name applied by the natives to certain portions of the territory in the west coast of Borneo, now under the control of the Chartered Company of British North Borneo, but it is doubtful how far this term can with propriety be applied to the whole of the territory.

Thence the boundary follows parallel 4° 10' N. lat. until the 117th meridian is intersected, whence it dips to the south-east until the coast is reached at Broers Hoek, 117° 37' E., and 4° 10' N. The total area of the Company's territory is estimated at about 31,000 square miles, with a coast-line of over 900 miles. The greater portion is exceedingly mountainous, and the interior consists almost entirely of highlands, with here and there open valleys and plateaus of fifty or sixty square miles in extent. On the west coast the mountain range runs parallel with the seashore, at a distance of from fifteen to twenty-five miles. Of this range the great central feature is the mountain of Kinabalu (the Chinese Widow), built up of porphyritic granite and igneous rocks to a height of 13,698 feet. Some fifteen or twenty miles to the north rises Mount Madalon (5000 feet). Inland, across the valley of the Pagalan river, which is itself a double row of hills from 1000 to 2000 feet in height, with a few plateaus marking the scenes of former lakes, the great peak of Trus Madi rises to a height estimated at 11,000 feet above sea-level, and between its base and the east coast the country is again covered with mountains and hills of varying height and magnitude. The principal plateaus are those of the Tambunan and Keningau valleys, in the basin of the Pagalan, and the Ranau plain to the eastward of the base of Kinabalu. Other similar plateaus of minor importance are also found dotted about the interior. The close proximity of the mountain range to the seashore causes the rivers on the west coast to be rapid boulder-obstructed streams, which, with the single exception of the Padas, are of little value as means of communication for a distance of more than half-a-dozen miles from their mouths. The Padas is navigable for light-draught steam-launches for a distance of about fifty miles, and boats can be punted up stream as far as Rayoh, a distance of some seventeen miles farther. Here further passage is stopped finally by rapids, down which nothing can be brought, and even below Rayoh navigation is rendered difficult and sometimes dangerous by obstructions of a similar nature. The other principal rivers on the west coast are the Kalias, Kimanis, Benoneh, Papar, Kinarut, Putatan, Inanam, Mengkabong, Tampassuk, and Pandasan rivers, none of which, however, are of any great importance as means of communication. The Tampassuk is noted for a stout breed of pony, and also for Kalupis waterfall (1500 feet), one of the highest in the world. At the northern extremity of the island Marudu Bay receives the waters of the Marudu, which rises on the west side of Mount Madalon. On the east coast the principal rivers are the Sugut, which rises in the hills to the east of Kinabalu, and forms its delta near Torongohok or Pura-Pura island; the Labuk, debouching in Labuk Bay, and having its sources seventy miles inland; the Kinabatangan, the largest and most important river in the territory, which has its rise, it is believed, to the eastward of the range of mountains of which Trus Madi is the principal feature, and is navigable by steamer for a considerable distance, and by boats for over a hundred miles from its mouth; the Segamah, which rises to the west of Darvel Bay; the Kumpong, and the Kalabakang, which debouches in Cowie Harbour. Taking it as a whole, the Company's territory is less generously watered than are other parts of Borneo, which again compare unfavourably in this respect with the Malayan States of the peninsula. Many of the rivers, and especially those on the west coast, are further obstructed by bars at their mouths, which render access to them difficult. Several of the natural harbours of North Borneo, on the other hand, are at once accessible, safe, and commodious. Sandakan Harbour, on the north-east coast (5° 40' N. lat. and 118° 10' E. long.), runs inland for some seventeen miles

with a very irregular outline broken by the mouths of numerous creeks and streams. The mouth, only two miles across, is split into two channels by the little island of Balhala. The depth in the main entrance varies from

17 to 10 fathoms, and vessels drawing 20 feet can advance half-way up the bay. The seat of government is the town of Sandakan, situated just inside the mouth of the Sarwaka inlet. At Silam, on Darvel Bay, there is good

MAP OF BORNEO.

Walker & Cockeill sc

anchorage; and Kudat, in Marudu Bay, discovered by Commander Johnstone of H.M.S. *Egeria* in 1881, is a small but valuable harbour. On Gaya Bay stands Jesselton, the principal coast terminus of the railway (110 miles in length), in course of construction along the coast from Weston, in Padas Bay, whence the

line is already open to Beaufort on the Padas river, a distance of twenty miles. From Beaufort the line runs along the right bank of the Padas river through the gorge from Rayoh to Tenom, a distance of about twelve miles. A road to Tenom down the whole length of the Pagalan valley, which will connect a large tract of country

with the railway, is in contemplation. The population of the Company's territory is about 200,000 (including 20,000 Chinese). Of this total three-fourths are found in the west coast districts. Sandakan, the capital, has a population of nearly 7000.

The seashore and the country for a few miles inland on the west coast are inhabited for the most part by Malay settlers originally from Brunei, by Bajaus, the descendants of the lawless pirate hordes once the terror of these seas, by Kadayans, who are also Mahomedans, and by Dusuns. The last are the most numerous. The east coast is less thickly peopled, but its inhabitants are almost entirely Bajaus and settlers from the neighbouring Sulu archipelago. The interior of the territory is inhabited almost entirely by Muruts, a debased race filled with savage instincts, whose habits are both unclean and debauched, men, women, and children alike being addicted to the excessive use of intoxicating liquors of native manufacture. Tribes of Dusuns are also found in villages scattered over the interior, but there can be little doubt but that the Muruts are the representatives of the aboriginal race of this portion of the island. The Dusuns have attained to a far higher stage of civilization than have the Muruts. They cultivate rice with considerable skill, and show great ingenuity in the management and construction of their irrigation work. Very few anthropological data are yet available concerning either the Dusuns or the Muruts, and it is impossible to pronounce with any certainty as to the stock to which they belong. Probably the theory that they do not properly belong to the Malayan family will prove to be well founded. On the other hand, the Bajaus and the Kadayans as well as the Bruneis undoubtedly are Malayan.

The climate of North Borneo is tropical, with a very equable temperature, and a steady, sufficient, but not excessive rainfall. The lowest reading of the thermometer recorded in 1899 at Sandakan was 72° Fahr. in January, June, July, and August. The maximum in the shade recorded at Sandakan during 1899 was 94° in August. The highest rainfall recorded on the coast during 1899 was 136.76 inches. The records made in the interior are unfortunately not trustworthy, but they certainly largely exceed those made on the coast.

The capabilities of the Company's territory are only dimly known. Coal has been found in the neighbourhood of Cowie Harbour, the quality of which is stated to be superior to any hitherto discovered east of Suez. Gold in alluvial deposits has been found in the beds of several rivers on the east coast, but as yet no reefs or lodes, and no large alluvial beds have been discovered. No trace of tin in payable quantities has yet been found, but the country has hitherto been little exploited by trained geologists or prospectors, and it would be premature to express an opinion as to the mineral wealth or poverty of the territory. The oil-springs of British North Borneo have as yet proved less satisfactory than those of other parts of the island. Iron ores have been found, and there are indications of the existence of copper, antimony, and zinc ores. The wealth of the country still lies chiefly in its jungle produce—gutta, rubber, rattans, mangrove-bark, edible nuts, guano, &c.; in its timber, which is of excellent quality, supporting a large export trade to Hong-Kong and the Philippines; and in its planting produce, of which tobacco, sago, sugar-cane, cocoanuts, coffee, pepper, and gambier are the principal items. There are twelve large tobacco estates now open, which have produced satisfactory results, the leaf grown being peculiarly well suited for the wrapping of cigars, and possessing, it is said, some of the special qualities of the Havana leaf. In 1886 the crop yielded 27 bales, valued at £471, but in 1897 the bales had grown to 10,469, and the value to £168,600, the value in 1898 being £200,000. There are forty-three estates planted with coffee and cocoanuts, three with Manila hemp, three with pepper and gambier. Rice is grown in large quantities in many parts, and it is probable that, when means of communication have been further improved, this will form an important item of export. The birds'-nests exported from the caves of the interior and on the coast bring in a steady annual revenue; and as the country is becoming daily more peaceful, new caves in the interior are annually being exploited by those who know how to avail themselves of their wealth.

The trade is largely in the hands of Chinese shopkeepers, who send their agents to the interior to attend the *Tamus*

(Malay, *Temu*, to meet) or fairs which are the recognized scenes of barter between the natives of the hills and those of the coast. At Sandakan there is a Chinese population of over 2000 souls. The Sabah Steamship Company, subsidized by the Chartered Company, possesses a number of boats which ply along the coast of the Company's territory, calling at all important points, and facilitating communication between the various stations. A German firm in Singapore runs vessels at short intervals between that port and Labuan and Sandakan, calling also at some of the other principal ports of the Company's territory. There is also frequent steamship communication between Sandakan and Hong-Kong, which is distant four days' steaming from the former port.

For administrative purposes the territory has been divided into nine provinces: Alcock and Dewhurst in the north; Keppel on the west; Martin in the centre; Myburgh, Mayne, and Elphinstone on the east coast; and Dent and Cunliffe in the south. The boundaries of these provinces, however, are purely arbitrary, and are not accurately defined. The territory is governed by a governor, who is appointed by the Court of Directors with the approval of the Secretary of State for the Colonies. The governor is assisted by a council which is composed of several of the senior officials and one non-official member. The administration is carried on by means of a civil service which is recruited by a system of selection. The officers in charge of Labuan, Kudat, and Darvel Bay possess the rank and title of resident. The officers administering the other districts are called district magistrates. The judicial work of the territory is performed by the residents, who hear appeals from the district courts, and by the governor, who is the final court of appeal. The Company's police force, which is officered by Europeans, is composed of Sikhs, Pathans, Punjabi Mahomedans, Dyaks, and Malays. The force numbers six hundred men of all ranks. Until recently expeditions were necessary almost annually to quell disturbances in the interior, the more serious of which were those fomented by the noted rebel, Muhammad Saleh, who was killed fighting against the Government on 31st January 1900. The country is now rapidly becoming pacified, and the natives of the interior are found to be very amenable to European rule. The laws are based on the Indian penal, criminal, and civil procedure codes, and local proclamations and ordinances. There is an Imam's court for Mahomedan law.

In 1888, by a convention dated between the British North Borneo Company and the British Government, the Company made over the control of its foreign relations to the British Government in consideration of being placed under the protection of Great Britain. On 1st January 1890 the Crown colony of Labuan was handed over to the British North Borneo Company by the Colonial Office for administrative purposes, the Secretary of State arranging for the issue of the necessary commission as governor of Labuan to the officer who for the time being might be approved by him as governor of British North Borneo. In 1899 it was decided to occupy the Tambunan country in the interior of British North Borneo, with an area of 500 square miles and a population of 25,000.

As regards religion and education, there is a Protestant mission which supports a church and school at Sandakan, with branches at Kudat, Labuan, and Kaningow. The Roman Catholic mission maintains several priests and chapels throughout the territory, with headquarters at Sandakan. The Chinese have their joss-houses, and the Mahomedans their mosques.

The following are statistics of revenue, expenditure, and trade:—

	1896.	1897.	1898.	1899.	1900.
	Dollars.	Dollars.	Dollars.	Dollars.	Dollars.
Revenue proper }	407,207	436,062	503,307	542,919	587,226
Land sale }	4,492	964	2,061	3,210	799
Expenditure }	313,807	341,124	381,807	369,351	402,858
Exports }	2,473,753	2,942,293	2,839,844	3,439,560	...
Imports }	1,882,188	1,887,498	2,419,087	2,456,988	...

About a million acres have been alienated by the Government on leases for 999 years. Shipping entered, in 1900, 110,908 tons; cleared, 111,385 tons, of which German ships were 47,125 tons entered, and 47,125 tons cleared, and British were 34,616 tons entered, and 34,522 tons cleared.

The Company has a copper coinage of $\frac{1}{2}$ and 1 cent pieces, and issues notes expressed in dollars and cents. Mexican, Straits Settlements, Hong-Kong, and British dollars are treated as currency. There are bank agencies in Sandakan, and the Company does banking business when required. The State, which has adopted the imperial penny postage, is in the Postal Union, and money orders on North Borneo are issued in the United Kingdom, India, the Straits Settlements, Ceylon, Hong-Kong, and elsewhere, and *vice versa*. The main telegraph runs from Menumbok on the west to Sandakan on the east, and a line is also being made from

Menumbok to Kudat, with connexion at Jesselton and other intermediate stations.

Bornholm, an island of Denmark, in the Baltic, 90 miles E. of Copenhagen and 23 S.E. of the coast of Sweden. Population, about 38,000. Excavations were carried on in the castle of Hammershuus in 1893. At Neksö a bust commemorates J. N. Madvig, who was born there in 1804 (died 1886). Coal-mining is now discontinued. A railway from Rønne (the capital; population, 9000) to Neksö, 22 miles, was opened in 1899.

Bornu, formerly a negro kingdom of some importance in the Central Sudan. Since 1880 it has steadily declined, owing to the political disturbances of which it has been the scene. The greater part of the area, which extends W. of Lake Chad in the valley of the Yobe, and S. between that river and the Shari, has been placed by international agreements within the British and German spheres of Nigeria and Cameroon, but no practical steps had been taken up to 1901 to establish the authority of these Powers in the country. After the visits of Rohlfs (1866) and Nachtigal (1871-73) the country was visited by no European traveller until 1892, when Colonel Monteil resided for a time at Kuka during his great journey from the Senegal to Tripoli. The French traveller noticed many signs of decadence, the energy of the people being sapped by luxury, while a virtual anarchy prevailed owing to rivalries and intrigues among members of the royal family. The king of Zinder had ceased to pay tribute, and the sultan was not strong enough to exact it by force. At the same time a danger was threatening from the south, where the negro adventurer Rabe or Rabah, once a slave of Zobeir Pasha, was menacing the kingdom of Baghirmi. After making himself master of the fortified town of Manifa, Rabe proceeded against Bornu, soon defeating the army of the sultan Ahsem in two pitched battles. In December 1893 Ahsem fled from Kuka, which was entered by Rabe and soon afterwards destroyed, the capital being transferred to Dikoa in the south of the kingdom. These events ruined the trade between Tripoli and Kuka by the long-established route *viâ* Bilma, which has not since recovered its importance. Rabe had by this time raised a large, well-drilled army, and proved a formidable opponent to the French in their advance on Lake Chad from the south. The expedition under Lieutenant Bretonnet was cut to pieces by his troops in 1899, but later in the same year he met with a severe defeat at the hands of Captain Robillot, and early in 1900 was again defeated, and killed, at Kussuri, near the lower Shari, by the combined forces of three French expeditions which had been converging from the Congo, the Sahara, and the Niger. By the Anglo-French agreement of 1898 the tributary state of Zinder in the north fell to the French sphere, and French influence has been established there by the expeditions under Foureau, Joalland, and Peroz.

(E. HE.)

Borrow, George Henry (1803-1881), English traveller, linguist, and author, was born at East Dereham, Norfolk, 5th July 1803, of a middle-class Cornish family. His father was a recruiting officer. His mother was a Norfolk lady of French extraction. From 1816 to 1818 Borrow attended, with no very great profit, the grammar school at Norwich. After leaving school he was articled to a firm of Norwich solicitors, where he neglected the law, but gave a great deal of desultory and unscholarly attention to languages. On the death of his father in 1824 he went to London to seek his fortune as a literary adventurer. Engaged by Sir Richard Phillips, the publisher, as a hack-writer at starvation wages, his experiences in London were bitter indeed. His struggles at last became so dire that if he would escape Chatterton's doom, he must leave London and either return to Norwich

GEORGE BORROW.

(From the painting by Phillips in the possession of Mr John Murray.)

and share his mother's narrow income, or turn to account in some way the magnificent physical strength with which Nature had endowed him. Determining on the latter of these courses, he left London on tramp. As he stood considerably more than 6 feet in height, was a fairly trained athlete, and had a countenance of extraordinary impressiveness, if not of commanding beauty—Greek in type with a dash of the Hebrew—we may assume that there had never before appeared on the English high-roads so majestic-looking a tramp as he who, on an afternoon in May, left his squalid lodging with bundle and stick to begin life on the roads. Shaping his course to the south-west, he soon found himself on Salisbury Plain. And then his extraordinary adventures began. After a while he became a travelling hedge-smith, and it was while pursuing this avocation that he made the acquaintance of the splendid road-girl, born at Long Melford Workhouse, whom he has immortalized under the name of Isopel Berners. He was now brought much into contact with the gypsies, and this fact gave him the most important subject-matter for his writings. For picturesque as is Borrow's style, it is this subject-

matter of his, the Romany world of Great Britain, which—if his pictures of that world are true—will keep his writings alive. Now that the better class of gypsies have migrated so rapidly to America that scarcely any are left in England, Borrow's pictures of them are challenged as being too idealistic. It is unfortunate that no one who was brought into contact with Borrow, and with the gryengroes or horse-dealers with whom he associated, and whom he depicted, has ever written about him and them. Full of "documents" as is Dr Knapp's painstaking biography, it cannot be said to give a vital picture of Borrow and his surroundings during this most interesting period of his life. It is this same peculiar class of gypsies (the gryengroes) with whom the present writer was brought into contact, and he can only refer, in justification of Borrow's pictures of them, to certain publications of his own, where the whole question is discussed at length, and where he has set out to prove that Borrow's pictures of the section of the English gypsies he knew are true to the life. As to the deep impression that Borrow made upon his gypsy friends, that is partly explained by the singular nobility of his appearance. For the gypsies are extremely sensitive upon matters of this kind. The silvery whiteness of the thick crop of hair which Borrow retained to the last seemed to add in a remarkable way to the nobility of his hairless face, but also it gave to the face a kind of strange look "not a bit like a Gorgio's," to use the words of one of his gypsy friends. Moreover, the shy, defiant, stand-off way which Borrow assumed in the company of his social equals left him entirely when he was with the gypsies. The result of this was that these wanderers knew him better than did his own countrymen. Seven years after the events recorded in *Lavengro* and *The Romany Rye* Borrow obtained the post of agent to the Bible Society, in which capacity he visited St Petersburg (1833-35) (where he published *Targum*, a collection of translations), and Spain, Portugal, and Morocco (1835-39). The result of these travels and adventures was the publication, in 1841, of *Zincali, or The Gypsies in Spain*. In 1843 appeared *The Bible in Spain*, when suddenly Borrow became famous. Every page of the book glowed with freshness, picturesqueness, and vivacity. In 1840 he married a well-to-do widow, and permanently settled at Oulton, near Lowestoft, with her and her daughter. Here he began to write again. Very likely Borrow would never have told the world about his vagabond wanderings in England as a hedge-smith had not *The Bible in Spain* made him famous as a wanderer. *Lavengro* appeared in 1851 with a success which, compared with that of *The Bible in Spain*, was only partial. He was much chagrined at this, and although *Lavengro* broke off in the midst of a scene in the Dingle, and only broke off there because the volumes would hold no more, it was not until 1857 that he published the sequel, *The Romany Rye*. In 1844 he travelled in South-Eastern Europe, and in 1854 he made a tour with his stepdaughter in Wales. This tour he described in *Wild Wales*, published in 1862. In 1874 he brought out a volume of ill-digested material upon the Romany tongue, *Romano Lavo-til, or Word-book of the Gypsy Language*. In the summer of 1874 he left London, bade adieu to Mr Murray and a few friends, and returned to Oulton. On the 26th July 1881 he was found dead in his house at Oulton, in his seventy-ninth year. (T. W. D.)

Borrowstounness, or Bo'NESS, a seaport, burgh of barony, and police burgh (1880), on the Firth of Forth, Linlithgowshire, Scotland. The harbour has been largely extended in recent times. At the end of 1898 the port register contained 10 vessels of 2385 tons; in 1898, entered 1097 vessels of 326,167 tons, cleared 1127

vessels of 324,194 tons. Coal and pig-iron are the principal commodities shipped, and Bo'ness is the principal port of discharge in Scotland for pitwood from the Baltic. Imports were valued at £219,778 in 1888, and at £223,612 in 1898; exports at £161,081 in 1888, and £219,582 in 1898. Iron foundries (7) and engineering works are now of great importance. Shipbuilding and whale-fishing are extinct. One of the schools has a well-equipped secondary department. Population (1881), 5284; (1901), 9100.

Borszék, a health resort of Eastern Hungary, situated among the Carpathians, 95 miles E. by N. of Kolosvár. It is noted for its mineral springs, six of which are rich in carbonic acid and one in iron oxide. From three to four million bottles of mineral water are prepared annually.

Bórystaw, a village in Galicia, Austria, at the foot of the lower northern slopes of the Carpathians, about 6 miles S. of Drohobycz. It is the chief centre of the Galician petroleum wells and ozocerite deposits. The oil beds occur immediately at the foot of the range of hills along a terrace but lightly raised above the level of the plain, where the sandstone is so saturated with petroleum as to form a soft white mass. The quality of the oil is inferior to that of Western Galicia and the yield has declined, while that of ozocerite has increased. Both products are refined at Bórystaw and the neighbouring village of Wolauka. The village is connected with the Austrian state railway by a branch line. Population (1890), 10,424 (double that of 1869); (1900), 10,671.

Borzhom, a small watering-place of Russia, Transcaucasia, government and 93 miles S.W. of Tiflis, 18 miles from the Transcaucasian railway. It is situated at an altitude of about 3000 feet, in the Borzhom gorge, a narrow rift in the Little Caucasus mountains. Its warm climate, its two hot springs, and the good state in which its beautiful parks are kept (the estate belonging to a member of the Russian imperial family), make it a favourite summer resort in Transcaucasia, and give it its popular name of "the pearl of Caucasus." The export of the bottled mineral waters, which was only 5350 bottles in 1890, reached 653,250 in 1897.

Borzna, a district town of S.W. Russia, government of Chernigov, 15 miles S. of the junction of the Desna with the Seim, and 9 miles from the Pliski station of the railway Kursk to Kieff. It is situated on sandy ground and surrounded on the north with marshes. It was annexed to Russia in 1654. Population, 12,500.

Bosboom, Anna Louisa Geertruida, née TOUSSAINT (who assumed the name of BOSBOOM-TOUSSAINT, after marrying at the Hague, in 1851, the well-known Dutch painter, Bosboom), (1812-1886), a distinguished Dutch novelist, was born at Alkmaar in North Holland, on 16th September 1812. Her father, a local chemist of Huguenot descent, gave her a fair education, and at an early period of her career Miss Toussaint developed a taste for historical research, fostered, perhaps, by a forced indoor life, the result of weak health. Her first romance, *Almagro*, appeared in 1837, followed by the *Graaf van Devonshire* (*The Earl of Devonshire*) in 1838; the *Engelschen te Rome* (*The English at Rome*) in 1840, and *Het Huis Lauernesse* (*The House of Lauernesse*) in 1841, an episode of the Reformation, translated into many European languages. These stories, mainly founded upon some of the most interesting epochs of Dutch history, betrayed a remarkable grasp of facts and situations, combined with an undoubted mastery over her mother tongue, though her style is sometimes involved, and not always faultless. Ten years (1840-50) were mainly devoted to further

studies, the result of which was revealed in 1851-54, when her *Leycester in Nederland* (3 vols.), *Vrouwen van het Leycestersche Tydperk* (*Women of Leicester's Epoch*, 3 vols.), and *Gideon Florensz* (3 vols.), appeared, a series dealing with Robert Dudley's adventures in the Low Countries. After 1870 Mrs Bosboom-Toussaint abandoned historical romance for the modern society novel, but her *Delftsche Wonderdokter* (*The Necromancer of Delft*, 1871, 3 vols.) and *Majoor Frans* (1875, 3 vols.) did not command the success of her earlier works. *Major Frank* has been translated into English (1885). Mrs Bosboom died at the Hague, 13th April 1886. Her novels have been published there in a collected edition (1885-88, 25 vols.) (H. Tr.)

Boshof. See ORANGE RIVER COLONY.

Bosnia and Herzegovina.—By the Berlin Treaty of 1878 the Turkish provinces of Bosnia and Herzegovina were handed over for civil administration and military occupation to the monarchy of Austria-Hungary. To Austria-Hungary was also committed the military occupation of the Turkish sanjak of Novi-Bazar, its civil administration being left to Turkey. Approximately of the shape of an equilateral triangle, the compact territory of Bosnia and Herzegovina forms the north-western part of the Balkan peninsula. It is bounded on the W. by Dalmatia, on the N. by Croatia and Slavonia, on the E. by Serbia, and on the S. by Turkey and Montenegro. Leaving out 6 kilometres of maritime boundary, the frontier line for about two-fifths of its length is formed by continuous watercourses, and for the remaining three-fifths runs over solid land, yet always following distinctive geographical features. According to the cadastral survey, the area of Bosnia and Herzegovina amounts to 19,700 square miles. The land is in general mountainous, yet ranges from low-lying plain up to the region of high mountains. In the north of Bosnia, along the Save, low-lying land, forming a continuation of the Hungaro-Slavonian depression, cuts here and there pretty deeply into the country, but in its progress to the south and south-west the land gradually rises, first to a hilly and then to a highland formation till, in the centre of the country and in Herzegovina, it attains the unequivocal character of high mountain. The hilly land reaches a mean elevation of about 1500 feet; the zone of highlands comprises heights of 3000 to 4500 feet; in the mountain districts of Travnik, Sarajevo, and Mostar, the principal peaks mount to over 6000 feet. In the depression, occupying about 5 per cent. of the land, the prevalent soil consists of exceedingly fertile alluvial deposits. The hilly land, about 24 per cent. of the whole area, and comprising fruitful valleys at the lower courses of its rivers, approximates in natural fertility of soil to the depression. The mountains and woodland, about 42 per cent. of the whole area, display not only natural forest and meadow, but also, though to a less extent, productive pasture. The Karst region, 29 per cent. of the whole area, from its scarcity of water and general poverty of soil, is suitable for cultivation only in the valleys and adjacent slopes, the rest being for the most part available only as pasture land. Geologically, the highlands of Bosnia and Herzegovina are to be regarded, both in their orographic and tectonic character, as a continuation of the South Alpine calcareous belt. Along the west frontier there appear broad and strongly-marked zones of Cretaceous limestone, alternating with Jurassic and Triassic, joined by a strip of Palæozoic formations running from the north-west corner of Bosnia. Next, proceeding from this region in an easterly direction, are the Neogene freshwater formations, filling up the greatest part of the north-east of Bosnia, as also a zone of

flysch intermingled with several strips of eruptive rock. In the south-east of Bosnia the predominant formations are Triassic and Palæozoic strata with red sandstone and quartzite. Along the whole northern rim of Bosnia, as also in the fluvial and Karst valleys (Poljes), are found diluvial and alluvial formations, interrupted at one place by an isolated granite layer.

Climatically, considerable variations are observable in different parts of Bosnia and Herzegovina. The winter rains of the Karst region show how it belongs to the fringe of the sub-tropical climatic zone. The greater part of Bosnia falls within a zone in which the atmospheric precipitations are, with approximate equableness, distributed all over the year, having affinity on one side to the Alpine climate of the southern highlands of Austria, and on the other side to the continental climate of the regions of the Danube and Theiss. The yearly precipitation amounts in the Herzegovina to 1610 mm.; in Bosnia to 1030 mm. The mean yearly temperature in the Herzegovina is in the lower lands 11·7° to 14·7° Celsius; in high regions, 7·7° Celsius; in Bosnia, 8·7° to 10° Celsius.

In correspondence with the natural configuration of the land and the variation of climate, the productions of the soil in the four natural regions are different. Fifty-five per cent. of the low-land is laid out in plough-land, garden, and meadow; 40 per cent. of it is pasture and woodland. In the hilly region 41 per cent. consists of plough-land, garden, and meadow; 56 per cent. of pasture and woodland. In the highlands plough-land occupies about 26 per cent.; pasture and woodland, 72 per cent. In the Karst region 16 per cent. is under the plough, and 81 per cent. is pasture and wood. The forest of the Karst region is mainly brushwood; that of the other regions tall timber and copse.

For purposes of administration, Bosnia and Herzegovina are divided into six districts (Kreise), the names, areas, and populations of which, according to the census of 1895, are as follows:—

District.	Area in Kilometres.	Civil Population.			Number of Persons to a Kilometre.	Natural Increase of Population since 1885, p.c.
		Males.	Females.	Persons.		
Sarajevo	8,411	121,131	106,976	228,107	27·12	1·86
Banjaluka	9,044	175,322	154,177	329,499	36·43	2·02
Bihac	5,526	102,896	89,001	191,897	34·90	2·06
Dolnja Tuzla	8,904	189,222	169,678	358,900	40·32	1·45
Travnik	10,023	128,515	111,573	240,088	23·85	1·52
Mostar (Herzegovina)	9,119	111,104	108,407	219,511	24·07	1·70
Total	51,027	828,190	739,812	1,568,002	30·73	1·74

Males accordingly constitute 52·86 per cent. of the total civil population. In respect of creeds, 35 per cent. of the inhabitants are Mahomedans; 43 per cent. Oriental Orthodox; 21·3 per cent. Roman Catholics; 0·5 per cent. Israelites. The Mahomedans are most strongly represented in the district of Sarajevo, making 49 per cent. of the population; the Oriental Orthodox in Banjaluka, 59·2 per cent.; the Roman Catholics in Travnik, 37·7 per cent.; and in Mostar, 40·2 per cent.; the Jews in Sarajevo, 2·1 per cent. Since 1885 the Mahomedans have increased by 11 per cent.; the Oriental Orthodox, 18 per cent.; the Roman Catholics, 26 per cent.; and the Jews, 41·5 per cent. The occupation of the land shows a preponderance of small settlements. In 73 per cent. of all the inhabited places the maximum population is 300; 23 per cent. of inhabited places have from 300 to 1000 inhabitants; only forty places have a population of more than 2000; eleven places have over 5000 inhabitants each. 32·4 of the population live in little settlements of a maximum population of 300; 39·8 per cent. in places of between 300 and 1000; 12·6 per cent. in places of between 1000 and 2000; 15·2 per cent. in places of larger population. The capital town, Sarajevo, has 38,083 inhabitants. The agricultural population of the whole land numbers 1,385,291 persons, or 88·4 per cent. of the total population. There are 221,581 heads of families. Of these 2·63 per cent. are landed proprietors; 39·21 per cent. are free peasants; 40·15 per cent. are *Kmeten* (not free); 10·23 per cent. are free peasants and at the same time *Kmeten*; and 7·78 are of other ranks engaged in agriculture.

There is a Roman Catholic archbishopric in Sarajevo, one bishopric in Mostar, and one Apostolic administrator in Banjaluka. There is further an Oriental Orthodox metropolitan in each of the towns of Sarajevo, Dolnja Tuzla, and Banjaluka. The Reis-el-Ulema is the highest Mahomedan ecclesiastical authority.

In the way of education, there are 3 higher gymnasia, a higher *real*, 1 technical, and 3 higher-grade girls' schools, a training college for teachers, a scheviot (rough wool) weaving school, a Roman Catholic archiepiscopal gymnasium and priest seminary, an Oriental Orthodox theological institute, 10 commercial schools, several handicraft schools, 108 general elementary schools, 1 national museum—all under State administration. There are, further, 1 private institute for female teachers, 1 Mahomedan training school for teachers, 1030 Mahomedan religious schools (among them 25 reformed), 41 *medresse* or Mahomedan high schools, 79 Oriental Orthodox and 29 Roman Catholic schools, 2 Jewish normal primary schools, 4 German private primary schools, and 6 Roman Catholic congregational female schools.

The budget for the administration of Bosnia and Herzegovina for the year 1900 showed the expenditure and revenue as follows:—

	Ordinary.	Extra-ordinary.	Total.
<i>Expenditure.</i>	£	£	£
Central Government . . .	143,606	8,368	151,974
Ministry of the Interior . .	675,242	33,956	709,198
„ „ Finance . . .	519,187	11,653	530,840
„ „ Justice . . .	66,921	4,484	71,405
„ „ Buildings . . .	203,605	61,803	265,408
Total . . .	1,608,561	120,264	1,728,825
<i>Revenue.</i>			
Central Government . . .	1,249	...	1,249
Ministry of the Interior . .	102,358	...	102,358
„ „ Finance . . .	1,398,236	666	1,398,902
„ „ Justice . . .	4,896	42	4,938
„ „ Buildings . . .	226,728	...	226,728
Total . . .	1,733,467	708	1,734,175

The entire area is laid out as follows:—

	Square Kilometres.	Percentage of Total Area.
Plough-land . . .	11,032	21·63
Garden ground . . .	483	0·95
Meadow . . .	3,465	6·79
Vineyard . . .	59	0·11
Pasture . . .	8,418	16·50
Wood . . .	26,581	52·10
Unproductive . . .	989	1·93

The yearly average total produce in wheat, rye, barley, oats, spelt, buckwheat, millet, corn and wheat mixed, maize, and marsh-millet, for the period 1892-96, amounted to over 5 million centners against a yearly average for the period 1882-86 of 2·24 millions, showing an increase for 1892-96 of more than double. The largest produce was yielded by maize, with 25,483 wagons (each 100 quintals); next, barley, 7879; wheat, 7854; oats, 4501; millet, 1590; spelt, 1318; rye, 1249; mixed corn and wheat, 1229; marsh-millet, 481; buck-

wheat, 88 wagons. In the north of the land and on the Dalmatian frontier the principal product is maize; in the south, barley. The yearly produce of pulse averaged, for the period 1892-96, 142,669 centners—an increase of 126·82 per cent. on the yield for 1882-86. The yearly yield of potatoes for 1892-96 averaged 519,667 centners, 190 per cent. more than in the corresponding years of the previous decade. Other products of the soil are tobacco, chiefly in Herzegovina, 37,160 centners; other commercial plants (rape-seed, hemp, linen, pyrethrum, madder), 32,225 centners. The yearly hay crop averaged, for the period 1892-96, 6,621,734 centners, 105 per cent. more than in the corresponding years of the previous decade; clover, principally in the district of Banjaluka, 19,761 centners.

Of great importance in the husbandry of Bosnia is the fruit culture, the yearly yield of which for the period 1892-96 was—

	Centners.	Increase per cent. on 1882-86.
Black damsons . . .	1,149,429	94·80
Other stone fruit . . .	140,926	240·40
Kernel fruit . . .	208,457	20·66
Nuts . . .	18,476	91·18
Tropical fruits (only in Herzegovina) . . .	7,402	280·57
Grapes (principally in Herzegovina) . . .	64,549	73·40

The following table shows the supply and distribution of cattle, &c., according to the census of 1895:—

	Number.	Number to a Kilometre.	For every 100 Agricultural Inhabitants.	Per cent. Increase since 1879.
Horses, Asses, and Mules . .	239,626	4·69	17·30	48·68
Horned cattle . . .	1,417,341	27·77	102·31	85·98
Sheep . . .	3,230,720	63·32	233·22	284·62
Goats . . .	1,447,049	28·36	104·46	177·15
Swine . . .	662,242	12·98	47·80	53·88
Beehives . . .	140,061	2·75	10·88	26·20

Mining forms an important branch of the industry of Bosnia. The metalliferous beds known from olden times have since the Austro-Hungarian occupation been taken in hand, and further openings have been made, first in 1881 by the Mining Company of Bosnia, an undertaking taken over by the State in 1886.

The mining output in 1898 was—

	Quantity, Quintals.	Value in Florins.
Fallow copper ore . . .	5,380	13,950
Copper ore . . .	37,850	23,546
Iron ore . . .	585,327	128,357
Chrome ore . . .	4,580	16,370
Manganese ore . . .	53,196	93,154
Zinc ore . . .	100	260
Pyrites . . .	2,404	...
Brown coal . . .	2,711,835	566,324
Salt spring . . .	1,177,708	47,112

The smelting works yielded in 1898:—

	Quantity, Quintals.	Value in Florins.
Mercury . . .	40·5	9,315
Pure copper . . .	1,489	109,340
Copper wares . . .	499	...
Raw iron . . .	185,865	505,025
Castings . . .	9,419	106,675
Martiningots . . .	86,694	...
Rolled iron . . .	85,109	737,470
Salt from evaporation . . .	144,962	1,120,264

The total value of the products of the smelting works was accordingly 2,538,080 florins, or, after deduction of waste stuffs from smelting, 2,138,943 florins. The mining output amounted to the value of 889,073 florins, an increase of 11 per cent. on the value of the preceding year's output.

The chief industries are weaving, leather, and metal work carried on by the workmen in their own houses. The Government has set up some workshops of its own with a view to a higher technical and artistic development of the house industry. More particularly, chased and inlaid metallic wares, bez (thin cotton), and carpet-weaving receive Government support. The four tobacco factories of the land, the national printing-press, an annular furnace for brick-burning, an iron-foundry, and several blast-furnaces are also under the management of the State. Among the larger private establishments are seven breweries, one brandy distillery, one sugar, two jam, two soap and candle factories, two building and furniture works, a factory for twisting thread, one

iron and steel-works, one paper and one ammonia and soda factory, and one mineral-oil refinery.

In respect of foreign trade Bosnia and Herzegovina have since 1882 been included in the customs and commercial system of Austria-Hungary, to the extinction of all intermediate imposts. Since 1898 special statistics have been drawn up respecting its trade also with Austria and Hungary. According to these statistics the most important articles of export are wood, 722,000 centners; coal and turf, 373,000 centners; fruit, 417,000 centners; minerals, 217,000 centners; soda, 124,000 centners; iron and steel, 82,000 centners; cattle, 324,000 head. Other articles of export are chemicals, dyeing and tanning stuffs, tobacco, sugar-beet, and kitchen-salt. The import consists principally of food stuffs, 546,000 centners; building materials, 228,000 centners; drinks, 95,000 centners; sugar, 45,000 centners; besides machinery, glass, fats, clothes, wooden and stone wares, and other products of industry. The total export in 1898 amounted to 3,861,759 centners; the total import to 1,937,291 centners. Of this trade nearly 19 per cent. was absorbed in the intercourse with Austria-Hungary by highways and transport; 46 per cent. by the State railways of Bosnia and Herzegovina.

In 1898 the total length of the railways was 877 kilometres, or 176 kilometres of railway to every 10,000 kilometres of the land. In 1898 the total length of the telegraph lines was 2840 kilometres, or 7182 kilometres' length of wire-line. Both are under State administration.

There is a national bank in Sarajevo with a joint stock of 10,000,000 florins, also carrying on a hypothecary credit business and managing the wholesale trade of the tobacco factories. There are savings banks in Banjaluka, Bjelina, and Brëka—all in stocks (340,000 florins joint stock), with a deposit, at the end of 1897, of 741,000 florins.

Bosnia Seraj. See SERAJEVO.

Boston, a municipal and parliamentary borough and seaport of Lincolnshire, England, 4 miles from the mouth of the river Witham, and 107 miles N. of London by rail. Since about 1884 it has been growing in importance as a commercial and fishing port, a result due principally to the construction (1882-84) of a new dock some 7 acres in extent, with an entrance lock giving vessels of 3000 tons access to the quay sides. In 1880-87 the bed of the river (for 3 miles) below the town was deepened to 27 feet, and a new cut of 3 miles in length made at its mouth into deep water. Further, an iron swing railway bridge, 126 feet long, was thrown across the river between the Great Northern railway and the dock. Above Boston the river was improved and the Grand Sluice deepened in 1881-83. A repairing slipway capable of taking vessels of 800 tons has been constructed. The parish church was further restored in 1874-91. A wing was added to the hospital in 1887. Recent buildings include a church (1885), two grain warehouses, and fishmarkets at the dock, a memorial hall (1893), a seamen's and fishermen's institute (1892), and an endowed middle-class girls' school. There are engineering works, and oil-cake and tobacco factories. The imports, principally timber, grain, cotton, and linseed, increased from £116,179 in 1881 to £449,499 in 1887, to £804,958 in 1893, and to £816,697 in 1899. The exports, embracing coal, machinery, and manufactured goods, increased from £83,000 in 1883 to £175,725 in 1887, and to £349,712 in 1891, but declined to £261,873 in 1899. In 1885 22 vessels of 4521 tons cleared; in 1899, 213 vessels of 67,356 tons. There is also a coasting trade of about 70,000 tons annually. In 1899, 61 vessels of 4285 tons

were registered at the port, and there were 76 fishing boats, employing over 2200 hands. There are also a deep-sea fishing and steam trawling fleet (40 vessels in 1899). In 1898 fish valued at £87,672 was landed here. Population (1891), 14,570; (1901), 15,667.

See FISHEY THOMPSON. *History and Antiquities of Boston*. Boston, 1856. — WHEELER. *The History of the Fens of South Lincolnshire* (chap. xii.). Boston, 1897.

Boston, capital of the commonwealth of Massachusetts, U.S.A., is situated in lat. 42° 21' N. and long. 71° 3' W. It is fifth in population among the cities of the United States, second in commerce and perhaps in wealth also, and richest in historic associations. In 1890 the population was 448,477, and in 1900 it was 560,892. The death-rate in 1890 was 23.4, and in 1900 it was 20.1. Of the total population in 1900, 274,922 were males, 285,970 females; 363,763 native-born, 197,129 foreign-born: 12,809 were coloured (of whom 11,591 were negroes). Out of 176,068 males, twenty-one years of age and over, 8111 were illiterate (unable to write), of whom 7701 were foreign-born. Out of 82,580 foreign-born males, twenty-one years of age and over, 43,331 were naturalized, 3637 had filed their first naturalization papers, 24,119 were

SKETCH MAP OF ENVIRONS OF BOSTON.

aliens, and the citizenship of 11,493 was returned as unknown. The so-called Boston metropolitan district, popularly termed "Greater Boston," comprises thirty cities and towns within a radius of 10 miles (generally speaking) from the State House, having a population in 1900 of 1,128,704, or 40.23 per cent. of the population of the state. Projects have been mooted for giving this district some form of political unity, and already the metropolitan principle has been recognized in the establishment of the metropolitan sewerage district, comprising parts of Boston, eleven other cities, and eleven towns; the metropolitan parks district, embracing twelve cities and twenty-five towns; and the metropolitan water district, composed of the cities and towns within a 10-miles' circuit of the State House. The government of Boston has been reconstructed in important particulars by amendments to the charter in Acts of the legislature of 1885, separating the executive and legislative

branches, and in subsequent Acts. It now comprehends a mayor, elected for a term of two years (annual salary, \$10,000), and a city council, composed of a board of aldermen, thirteen members, elected annually (salary, \$1500 each), and a common council of seventy-five members, three from each ward, also elected annually (salary, \$300 each). In the mayor are vested the executive powers of the city, and the legislative powers are vested in the city council, to be exercised by concurrent vote. The mayor appoints, subject in most cases to confirmation by the board of aldermen, all heads of departments, boards, and commissions with the exception of the police commissioners, who are appointed by the governor of the commonwealth. The mayor has the veto power over acts of the board of aldermen and of the common council, and, in matters involving the expenditure of money, of the school committee. A two-thirds vote of all the members of both branches of the city council or of the school committee will override the mayor's veto. The school committee is an independent body, having both executive and legislative functions, subject in its expenditure of money only to the mayor's veto. It is composed of twenty-four members, elected for terms of three years, eight members annually, including such women as may qualify for that purpose. There is a superintendent of schools (salary, \$4200), and a board of supervisors, six members (salary, \$3780 each), to which women are eligible, elected by the school committee annually, the duties of the latter being to examine the schools in detail at stated intervals, and to conduct the annual examinations of pupils. The total expenditure for schools and schoolhouses in 1900-1901 was \$3,714,446.26; net running expenses for the same period, \$2,676,098.70; number of pupils, 88,852; net rate per scholar, \$32.96; number of school buildings in 1901, 224; value of school buildings (nominal), \$12,637,300. According to the census of 1900, there were in the city 143,858 persons of school age (5 to 20 years inclusive). The total current expenses of the city for 1900 were estimated at \$30,000,000. The net city debt in 1901 was \$51,385,763.44. The valuation of the city, real and personal, taxable property, in 1900 (1st May) was \$1,129,175,832, an increase of \$330,400,000 in twenty-five years. The valuation of property held by religious, charitable, literary, and scientific corporations, exempt from taxation, was: real, \$21,508,300, and personal, \$24,665,020.

The Boston public library, founded 1852, is one of the oldest free libraries in the country, and the largest, with the possible exception of the Library of Congress at Washington. The building (1888-95) is of stone, in the Italian Renaissance style, and of dignified façades, quadrangular in shape, surrounding a court, with richly designed and embellished marble entrance hall. The walls at the head of the main staircase were decorated by M. Puvis de Chavannes, and there are mural paintings in other rooms and corridors by Edwin A. Abbey, R.A., illustrating "The Quest of the Holy Grail," and by John S. Sargent, R.A., depicting the struggle of Judaism with polytheism. The cost of the building, with subsequent interior alterations, was \$2,500,000. The annual cost of maintenance of the library is \$255,000, appropriated by the city government. Other valuable and important libraries, private institutions, but hospitable to scholars, are the collections of the Boston Athenæum, founded in 1807; the Massachusetts historical society (founded 1791); the American academy of arts and sciences (founded 1780); the New England historic-genealogical society (1845); the Boston society of natural history (1830); and the Massachusetts horticultural society (1829). The Massachusetts state library, in the State House annex, has a notable collection. The State House annex is practically

a new State House, built (1889-97) in the rear of, and connected with, the "Bulfinch Front," the State House designed by Charles Bulfinch, the pioneer American architect, built in 1795. Boston is the seat of various collegiate institutions—the Boston university (chartered 1869), embracing a college of liberal arts, schools of law, theology, and medicine, and a graduate school of arts and sciences; the Massachusetts institute of technology (founded 1865), comprising eight laboratories, and including six large buildings, workshops, and a gymnasium; the medical school, the dental school, the school of veterinary medicine, and the Bussey institution, or school of agriculture and horticulture, all of Harvard University, the remaining departments of which are in the college buildings at Cambridge; the Massachusetts college of phar-

macy (1852); the Massachusetts normal art school (1873); Boston college (1860), Roman Catholic; and St John's theological seminary (1880), Roman Catholic. Boston also sustains numerous art schools, while the museum of fine arts (founded 1870), with its school of drawing and painting (1876), is one of the most important institutions of its kind, well endowed, richly stored with collections of paintings, statuary, and objects of *virtu*, and maintained at a high standard. As a musical centre Boston has long been recognized. Chief among its musical training schools is the New England conservatory of music (incorporated 1870), the largest in the country. The Boston symphony orchestra, composed of picked musicians, organized in 1887, and sustained by the munificence of a single citizen, is a permanent feature, giving each season twenty-four public concerts and as many public rehearsals, of the highest order, at low prices. The Lowell institute, established in 1839 under the will of John Lowell, junior, who bequeathed \$237,000, one-half of his property, for this purpose, provides annually regular

courses of free public lectures upon branches of natural and moral science by the foremost authorities of the day on these subjects. The theatres number seventeen. There are twenty clubhouses, one of which, that of the Mayflower club, is for women. Of churches there are 296—228 Protestant, 49 Roman Catholic, and 19 Jewish synagogues. The Roman Catholic churches outnumber those of any single Protestant denomination, the largest among the latter—thirty-eight—being credited to the Baptists; the Congregational Trinitarians and the Methodist Episcopalians come next with thirty-six each; the Protestant Episcopalians, thirty-four; and the Congregational Unitarians, twenty-five. In private charities, philanthropic and beneficent work, Boston annually expends large sums through organizations of various classes. There are about 300 of these bodies, or one society for every 1800 persons in the city. The charitable capital has been estimated at upwards of \$17,000,000, and the annual contribution of citizens for charitable and benevolent purposes at more than \$600,000. The Associated Charities of Boston is an incorporated organization (1881), with a central office, and district offices in various sections, employing numerous paid agents and volunteer assistants, the objects of which are to secure the concurrent and harmonious action of the different charities of the city. Among the larger and more important of the beneficent institutions are thirty-three thoroughly equipped special hospitals, and three general hospitals, the latter including the Massachusetts general hospital, and the Massachusetts homoeopathic hospital.

The foreign commerce of Boston is second only to that of New York. The exports for the year ending 30th June 1901, valued at \$143,708,268, were the largest in the history of the port; the imports were \$61,452,370. The aggregate foreign commerce for 1900, \$192,608,536, shows an increase in a quarter of a century, or since 1875, of \$109,760,279. Nearly one-fourth of the entire American exports of the various meat and dairy products classed as provisions, in the year ending 30th June 1899, passed through this port. It holds the first place among American ports in the export of live cattle. It is the largest wool market and the largest fish market in the country, in each second only in the world to London. The ocean tonnage entered and cleared in the foreign trade in the year ending 30th June 1900 aggregated 4,145,187 tons; the steamship sailings to foreign ports were 973. In connexion with the freight service there has been built up between Boston and Liverpool a passenger service of increasing proportions. The arrivals in the coastwise trade in 1900 were 10,436, an aggregate tonnage of 8,244,860 tons. In various industries the census of 1895 showed \$77,064,107 of capital invested. The great railway systems having their terminals in Boston—the Boston and Maine (with which are consolidated the former Eastern; the Boston and Lowell systems, extending into New Hampshire and Canada, and the Fitchburg and Hoosac tunnel system), entering on the north side of the city; the New York, New Haven, and Hartford (controlling by lease the Boston and Providence, the Old Colony, and the New England railways), and the Boston and Albany (New York Central) systems, entering on the south side—now enter two immense stations—the Union, or North station, and the South Terminal—in place of eight separate stations, four on each side. The Union station, first completed (1893), a structure of brick, granite, and brown stone, covers an area of 9 acres. The train-shed is 539 feet long, 537 feet wide, and 51 feet high, and contains 23 tracks. The length of tracks under cover is 2 miles, and nearly 600 passenger trains arrive and depart from this station each week-day. The South Terminal station (built 1897-98) is called the largest and most costly of modern railway stations. It covers an area

of 13 acres. The train-shed is with curved roof of one sweep 602 feet long, 570 feet wide, and 112 feet extreme height. There are 32 tracks—28 on the main floor, and 4 in the shape of 2 loop tracks on the lower or subway, for suburban traffic. The length of tracks under the roof is 4 miles, and the number of trains using the station daily is 750; on Sundays 195. It was estimated in 1900 that 50,000,000 passengers were carried to and from Boston yearly upon the railway routes within a radius of 50 miles of the city. The street electric car system is the most extensive in the world, the total length of track being 337 miles, and the number of passengers annually carried upwards of 190,000,000. Many of its lines pass through the heart of the city by the subway, an underground work built in 1895-98 to relieve the congestion caused by the pressure of cars and traffic in some of the most crowded thoroughfares. The subway is about a mile and two-thirds in length, partly with four tracks and partly with two. Grade crossings are avoided by means of interior loops, with sub-subways at junction points. The width of the four-track portion is 48 feet. The average height is 14 feet. The platforms at the stations are island platforms. The interior is lighted throughout by electricity, and thoroughly ventilated by fans. The subway was built under the supervision of the Boston Transit Commission at a cost of \$4,250,000 within the appropriation. Over 50,000,000 passengers are carried through it annually. The compensation paid by the railway company for its use is a sum per annum equal to $\frac{1}{4}$ per cent. of its net cost. An elevated railway through portions of the city, completed in 1901, is worked in connexion with the surface system.

Boston has a magnificent system of public parks, in addition to the historic Common in the heart of the city, which has been a Common almost since the founding of the town, and the unique public garden separated from the Common by a single street. This system, a chain of parks, embraces 2308 acres of picturesque lands, 126.9 acres of ponds and rivers, 38.45 miles of drives, 70.01 miles of walks, and 8.7 miles of rides. There are, besides, numerous playgrounds and separate parks. The cost of the system, including lands and construction, to January 1900 was \$16,627,033. In the outlying districts, mostly within the boundaries of "Greater Boston," is the larger metropolitan parks system, established by the state, which embraces 9279 acres of forest or woods, seashore, and river-bank reservations, and 17 miles of park-ways and boulevards, valued at \$10,000,000. Notable additions to the public statues and monuments of the city are the monument by Augustus St Gaudens to Colonel Robert G. Shaw (1895), commander of the first enlisted coloured regiment in the Civil War, killed at its head while leading the assault on Fort Wagner in 1863; statues of General, afterwards Judge Charles Devens (1898), of Sir Henry Vane, in the vestibule of the public library, and of Admiral Farragut (1896); and a monument to John Boyle O'Reilly (1892). A regular department of the city government is an art department, in charge of five commissioners, serving without pay, appointed by the mayor from candidates named by certain local art and literary institutions, without whose approval no work of art can become the property of the city. (E. M. B.)

Botany. See ANATOMY OF PLANTS, CYTOLOGY, PALMBOBOTANY, PATHOLOGY OF PLANTS, PHYSIOLOGY OF PLANTS, &c.

Bothnia, Gulf of. See BALTIC SEA.

Bothwell, a village of Lanarkshire, Scotland, stands near the Clyde, 8 miles S.E. of Glasgow by rail. A gravitation water-supply has been introduced, the old

parish church restored, and a statue of the poetess, Joanna Baillie, a native, erected (1899). Population (1881), 1535; (1901), 3097. The parish of Bothwell, which contains coal-mines, quarries, and ironworks, embraces also the towns of Uddingston (5099), Bellshill (3330), and Holytown (2811), and parts of two others, besides several large villages. Population (1881), 25,540; (1901), 45,901.

Botoșani, a town in Rumania, in the north of Moldavia, situated in the midst of a rich agricultural and pastoral country. It has a commercial importance, being the town through which goods from Poland and Galicia pass in transit for the south. There are extensive flour-mills equipped with modern appliances. The town of Botoșani owes its name to a Tartar chief, Batus or Batu Khan, grandson of Genghis Khan, who occupied the country in the 13th century. There is a large colony of Armenians. Population (1895), 33,000; (1900), 32,193.

Bottesini, Giovanni (1823-1889), Italian contrabassist and musical composer, was born at Crema in Lombardy on 24th December 1823. He studied music at the Milan Conservatoire, devoting himself especially to the double-bass, an instrument with which his name is principally associated. On leaving Milan he spent some time in America and also occupied the position of principal double-bass in the theatre at Havana. Here his first opera, *Cristoforo Colombo*, was produced in 1847. In 1849 he made his first appearance in England, playing double-bass solos at one of the Musical Union concerts. After this he made frequent visits to England, and his extraordinary command of his unwieldy instrument gained him great popularity in London and the provinces. Apart from his triumphs as an executant, Bottesini was a conductor of European reputation, and earned some success as a composer, though his work had not sufficient individuality to survive the changes of taste and fashion. He was conductor at the Théâtre des Italiens in Paris from 1855 to 1857, where his second opera, *L'Assedio di Firenze*, was produced in 1856. In 1861 and 1862 he conducted at Palermo, supervising the production of his opera *Marion Delorme* in 1862, and in 1863 at Barcelona. During these years he diversified the toils of conducting by repeated concert tours through the principal countries of Europe. In 1871 he conducted a season of Italian opera at the Lyceum Theatre in London, during which his opera *Ali Baba* was produced, and at the close of the year he was chosen by Verdi to conduct the first performance of *Aida*, which took place at Cairo on 27th December 1871. Bottesini wrote three operas besides those already mentioned: *Il Diavolo della Notte* (Milan, 1859); *Vinciguerra* (Paris, 1870); and *Ero e Leandro* (Turin, 1880), the last named to a libretto by Arrigo Boito, which was subsequently set by Mancinelli. He also wrote *The Garden of Olivet*, a devotional oratorio (libretto by Joseph Bennett), which was produced at the Norwich Festival in 1887, a concerto for the double-bass, and numerous songs and minor instrumental pieces. Bottesini died at Parma on 7th July 1889. (R. A. S.)

Botzen (German, *Bozen*; Italian, *Bolzano*) the chief town of the government-district of the same name in Tirol, Austria. Population (1890), 11,744; (1900), 13,632; Catholic and German, with the exception of about 12 per cent. Italians. There is a garrison of 1032 men. Botzen, which is the busiest commercial town in the German Tirol, owes a portion of its prosperity to its popularity, and that of the adjoining village of Gries, as a winter resort. This accounts for the handsome new district, with hotels and villas, which has grown up in the south-western outskirts of the town. Viticulture and the growth of fruit and vegetables, in which there

is an important export trade not only to the neighbouring countries but to North Germany, Russia, and America, is the principal resource of the district, in addition to the important transit trade.

Boucher de Crèvecœur de Perthes, Jacques (1788-1868), French geologist and antiquary, was born on 10th September 1788, at Rethel, Ardennes, France. He was the eldest son of Jules Armand Guillaume Boucher de Crèvecœur, botanist and customs officer, and of Étienne-Jeanne-Marie de Perthes (whose surname he assumed in addition to his father's). A fancy for a seafaring life was quenched in him by a short experience at the age of thirteen, and in 1802 he entered Government employ as an officer of customs. His duties kept him for six years in Italy, whence returning (in 1811) he found rapid promotion at home, and finally was appointed (March 1825) to succeed his father at Abbeville, where he remained for the rest of his life, being superannuated in January 1853, and dying at Amiens on 5th August 1868. His leisure was chiefly devoted to the study of what was afterwards called the Stone Age, "antediluvian man," as he expressed it. By his collections of flints gathered in Europe, Asia, and Africa, and by his monumental work *Antiquités celtiques et antédiluviennes; Mémoire sur l'industrie primitive et les arts à leur origine* (Paris, 1847, 1857, 1864, 3 vols.) he was the first to establish the existence of man in the Quaternary period. His views met with little approval, till the English geologists, following Falconer and Prestwick, pronounced in their favour. In 1863 and 1864 the discovery of human jawbones together with worked flints in the quarry of Moulin-Quignon near Abbeville seemed to vindicate Boucher de Perthes entirely, but doubt was thrown on the genuineness of the find, though not on the good faith of the discoverer, who was the same year made an officer of the Legion of Honour together with Quatrefages his champion. Boucher de Perthes displayed activity in many other directions. He was the author of several tragedies, two books of fiction, several works of travel, and a number of books on economic and philanthropic questions, e.g., *Opinion de M. Christophe Vigneron sur les prohibitions et la liberté de commerce* (1831-84), *De la Misère* (1840), *De la Femme dans l'état social, &c.* (1860). To his scientific books must be added a rather fantastic treatise: *De la création: essai sur l'origine et la progression des êtres* (1839-41).

See ALCIUS LEDIEN. *Boucher de Perthes; sa vie, ses œuvres, sa correspondance*. Abbeville, 1885. (J. M.F.)

Bouches du Rhône, a French department on the Mediterranean, washed by the Rhône (which, discharging its waters into the sea, there forms a large delta), by the Durance, a tributary of the Rhône, forming the N.E. frontier of the department, and by the Arc.

Area, 2026 square miles, divided among 29 cantons and 109 communes. The population, 604,857 in 1886, had increased to 784,847 in 1901. This increase is due in part to foreign immigration, mostly Italian, the contingent of which mounted from 42,955 in 1872 to 97,500 in 1896. Births in 1899, 16,688, of which 2079 were illegitimate; deaths, 17,831; marriages, 5081. In 1896 the primary schools numbered 872, with 790,000 pupils; 4 per cent. of the population was illiterate. The chief towns are Marseilles (the capital, and the third city of France), with 442,389 inhabitants in 1896, Aix and Arles the sub-prefectures. The surface under cultivation in 1896 amounted to only 741,000 acres, of which 390,260 acres were plough-land and 61,750 acres in vines. The wheat crop in 1899 was of the value of £400,010, and the other cereals also yielded but mediocre returns. The vine brought the department a revenue of over £1,043,000. Among the other cultures may be mentioned olive, yielding (1898) £245,779; and mulberry, £19,737. The sericultural product amounted to 2999 cwts. The live stock has largely increased since 1872, especially sheep. Out of 626,670 head in all in 1899, 528,490 were sheep. The mineral production registered, in 1896, 364,000 tons of lignite

of the value of £132,000, and 63,500 tons of salt got from the salt-pans of the coast. Mining in 1898 yielded 16,000 tons of iron and cast-iron. Altogether, its gross returns exceeded the value of £250,000; its principal centres are the forges and ship-engineering works of Marseilles and Ciotat. Other industries are manufactures of oil, soap, glass, and chemicals. Including its transit trade, the commerce of Marseilles amounted in 1898 to the value of £78,200,000, more than a sixth of the general commerce of France, which totalled the value of £440,000,000.

Boucicault, Dionysius Lardner (commonly known as DION) (1822-1890), actor and playwright, was born in Dublin, 26th December 1822. His education was partly gained in Dublin and partly in London. Before he was twenty he was fortunate enough to make an immediate success as a dramatist with his play, *London Assurance*, which was produced at Covent Garden on 4th March 1841 with a cast that included Charles Mathews, Farren, Mrs. Nesbitt, and Madame Vestris. It was given out to be from the pen of "Mr. Lee Morton," but all Boucicault's succeeding plays appeared under his own name. Amongst his most conspicuous early successes were: *Alma Mater* (Haymarket, September 1842), *Old Heads and Young Hearts* (Haymarket, November 1844), *A School for Scheming* (Haymarket, February 1847), and *The Broken Vow* (Olympic, February 1851). In June 1852 he made his first appearance as an actor, in a melodrama of his own entitled *The Vampire*, at the Princess's Theatre. Soon after this he went to the United States, where he remained (principally in New York) till 1855. A play of his called *The Fox Hunt* was successfully produced at Burton's Theatre, New York, in November 1853. In September 1860 he reached the climax of his career in the production of *The Colleen Bawn* at the Adelphi, a play that was hailed as one of the best domestic dramas of the day. This was followed at the same theatre by *The Octoroon* in November 1861. Boucicault's next marked success was with *Arrah-na-Pogue*, at the Princess's Theatre in March 1865. In this play he gave a masterly delineation of Irish character in the part of a Wicklow carman, a performance which won him the reputation of the best stage Irishman of his time. Plays, original and adapted, flowed in numbers from his pen during the next ten years; until, after the production of *The Shaughraun* at Drury Lane in September 1875, he returned to New York, and finally made his home there. Previous to this he had undertaken the partial or entire management of various London theatres, usually with disastrous financial results. During the latter years of his life he exercised a powerful influence in the theatrical world of New York, and was still prolific in his output of original plays and adaptations. He paid occasional visits to London, where his last appearance as an actor was made in his play, *The Jilt*, at the Prince of Wales's Theatre in 1886. He was twice married, his second wife being Agnes Robertson, the adopted daughter of Charles Kean. He died in New York on 18th September 1890. (R. F. S.)

Bougie, a seaport of Algeria, on the Bay of Bougie, 120 miles E. of Algiers, at the foot of Mount Guraya. It is the seat of a sub-prefecture in the department of Constantine. It serves Central Kabylia, and is a centre for the commerce in oils, wools, hides, and minerals. The traffic of the port amounted in 1898 to 70,000 tons. The population in 1872 was only 7200, but, owing to the impulse given to colonization, it had increased in 1890 to 12,380, and in 1900 to 14,290 (2510 French).

Bouguereau, Adolphe William (1825—), French painter, was born at La Rochelle, 30th November 1825. From 1843 till 1850 he went through the course of training at the École des Beaux Arts, and in

1850 divided the Grand Prix de Rome scholarship with Baudry, the subject set being "Zenobia on the banks of the Araxes." On his return from Rome in 1855 he was employed in decorating several aristocratic residences, deriving inspiration from the frescoes which he had seen at Pompeii and Herculaneum, and which had already suggested his "Idyll" (1853). He also began in 1847 to exhibit regularly at the Salon. "The Martyr's Triumph," the body of St Cecilia borne to the catacombs, was placed in the Luxembourg after being exhibited at the Great Exhibition of 1855; and in the same year he exhibited "Fraternal Love," a "Portrait," and a "Study." The State subsequently commissioned him to paint the emperor's visit to the sufferers by the inundations at Tarascon. In 1857 Bouguereau received a first prize medal. Nine of his panels executed in wax-painting for the mansion of M. Bartholomy were much discussed—"Love," "Friendship," "Fortune," "Spring," "Summer," "Dancing," "Arion on a Sea-horse," a "Bacchante," and the "Four Divisions of the Day." He also exhibited at the Salon "The Return of Tobit" (now in the Dijon Gallery). While in antique subjects he showed much grace of design, in his "Napoleon," a work of evident labour, he betrayed a lack of ease in the treatment of modern costume. M. Bouguereau subsequently exhibited "Love Wounded" (1859), "The Day of the Dead" (at Bordeaux), "The First Discord" (1861, in the Club at Limoges), "The Return from the Fields" (a picture in which Théophile Gautier recognized "a pure feeling for the antique"), "A Fawn and Bacchante," and "Peace"; in 1863 a "Holy Family," "Remorse," "A Bacchante teasing a Goat" (in the Bordeaux Gallery); in 1864 "A Bather" (at Ghent, and "Sleep"; in 1865 "An Indigent Family," and a portrait of Mme. Bartholomy; in 1866 "A First Cause," and "Covetousness," with "Philomela and Procne"; and some decorative work for M. Monthun at La Rochelle, for M. Emile Péreire in Paris, and for the churches of St Clotilde and St Augustin; and in 1866 the large painting of "Apollo and the Muses on Olympus," in the Great Theatre at Bordeaux. Among other works by this artist may be mentioned "Between Love and Riches" (1869), "A Girl Bathing" (1870), "In Harvest Time" (1872), "Nymphs and Satyrs" (1873), "Charity" and "Homer and his Guide" (1874), "Virgin and Child," "Jesus and John the Baptist," "Return of Spring" (which was purchased by an American collector, and was destroyed by a fanatic who objected to the nudity), a "Pieta" (1876), "A Girl defending herself from Love" (1880), "Night" (1883), "The Youth of Bacchus" (1884), "Biblis" (1885), "Love Disarmed" (1886), "Love Victorious" (1887), "The Holy Women at the Sepulchre" and "The Little Beggar Girls" (1890), "Love in a Shower" and "First Jewels" (1891). To the Exhibition of 1900 were contributed some of Bouguereau's best known pictures. Most of his works, especially "The Triumph of Venus" (1856) and "Charity," are popularly known through engravings. "Prayer," "The Invocation," and "Sappho" have been engraved by M. Thirion, "The Golden Age" by M. Annetombe. Bouguereau's pictures, highly appreciated by the general public, have been severely criticized by the partisans of a freer and fresher style of art, who have reproached him with being too content to revive the formulas and subjects of the antique. At the Great Exhibition of 1867 M. Bouguereau took a third-class medal, in 1878 a medal of honour, and the same again in the Salon of 1885. He was chosen by the Society of French Artists to be their vice-president, a post he filled with much energy. He was made a member of the Legion of Honour in 1856, an officer of the Order 26th July 1876, and Commander 12th July 1885. He succeeded Pils as member of the Institute, 8th January

1876. Bouguereau has also been highly distinguished as a teacher.

Boulanger, George Ernest Jean Marie (1837-1891), French general, was born at Rennes, 29th April 1837. He entered the army in 1856, and served in Algeria, Italy, Cochinchina, and the Franco-German war, earning the reputation of being a smart soldier. He was made a brigadier-general in 1880, on the recommendation of the duc d'Aumale, then commanding the 7th army corps, and Boulanger's expressions of gratitude and devotion on this occasion were remembered against him afterwards when, as War Minister in M. Freycinet's Cabinet, he erased the name of the duc d'Aumale from the Army List, as part of the republican campaign against the Orleanist and Bonapartist princes. In 1882 his appointment as director of infantry at the War Office enabled him to make himself conspicuous as a military reformer; and in 1884 he was appointed to command the army occupying Tunis, but was recalled owing to his differences of opinion with M. Cambon, the political resident. He returned to Paris, and began to take part in politics under the ægis of M. Clémenceau and the Radical party; and in January 1886, when M. Freycinet was brought into power by the support of the Radical leader, Boulanger was given the post of War Minister. By introducing genuine reforms for the benefit of officers and common soldiers alike, and by laying himself out for popularity in the most pronounced fashion—notably by his fire-eating attitude towards Germany in April 1887 in connexion with the Schnæbelé frontier incident—he came to be accepted by the mob as the man destined to give France her revenge for the disasters of 1870, and to be used simultaneously as a tool by all the anti-Republican intriguers. His action with regard to the royal princes has already been referred to, but it should be added that Boulanger was taunted in the Senate with his ingratitude to the duc d'Aumale, and denied that he had ever used the words alleged. His letters containing them were, however, published, and the charge was proved. Boulanger fought a bloodless duel with the baron de Lareinty over this affair, but it had no effect at the moment in dimming his popularity, and on M. Freycinet's defeat in December 1886 he was retained by M. Goblet at the War Office. M. Clémenceau, however, had by this time abandoned his patronage of Boulanger, who was becoming so inconveniently prominent that, in May 1887, M. Goblet was not sorry to get rid of him by resigning. The mob clamoured for their “brav général,” but M. Rouvier, who next formed a Cabinet, declined to take him as a colleague, and Boulanger was sent to Clermont-Ferrand to command an army corps. A Boulangist “movement” was now in full swing. The Bonapartists had attached themselves to the general, and even the comte de Paris encouraged his followers to support him, to the dismay of those old-fashioned Royalists who resented Boulanger's treatment of the duc d'Aumale. His name was the theme of the popular song of the moment—“C'est Boulanger qu'il nous faut”; the general and his black horse became the idol of the Parisian populace; and he was urged to play the part of a plebiscitary candidate for the Presidency. The general's vanity lent itself to what was asked of it; after various symptoms of insubordination had shown themselves, he was deprived of his command in 1888 for twice coming to Paris without leave, and finally, on the recommendation

of a council of inquiry composed of five generals, his name was removed from the Army List. He was, however, almost at once elected to the Chamber for the Nord, his political programme being a demand for a revision of the constitution. In the Chamber he was in a minority, since genuine Republicans of all varieties began to see what his success would mean, and his actions were accordingly directed to keeping the public gaze upon himself. A popular hero survives many deficiencies, and neither his failure as an orator nor the humiliation of a discomfiture in a duel with M. Floquet, an elderly civilian, sufficed to check the enthusiasm of his following. During 1888 his personality was the dominating feature of French politics, and, when he resigned his seat as a protest against the reception given by the Chamber to his revisionist proposals, constituencies vied with one another in selecting him as their representative. At last, in January 1889, he was returned for Paris by an overwhelming majority. He had now become an open menace to the parliamentary Republic. Had Boulanger immediately placed himself at the head of a revolt, he might at this moment have effected the *coup d'état* which the intriguers had worked for, and might not improbably have made himself master of France; but the favourable opportunity passed. The Government, with M. Constans as Minister of the Interior, had been quietly taking its measures for bringing a prosecution against him, and within two months a warrant was signed for his arrest. To the astonishment of his friends, on 1st April he fled from Paris before it could be executed, going first to Brussels and then to London. It was the end of the political danger, though Boulangist echoes continued for a little while to reverberate at the polls during 1889 and 1890. Boulanger himself, having been tried and condemned *in absentia* for treason, in October 1889 went to live in Jersey, but nobody now paid much attention to his doings. The world was startled, however, on 30th September 1891 by hearing that he had committed suicide in a cemetery at Brussels by blowing out his brains on the grave of his mistress, Madame de Bonnemains (*née* Marguerite Crouzet), who had died in the preceding July.

Boulder, capital of Boulder county, Colorado, U.S.A., situated at the base of the Front Range, on Boulder Creek, in 40° 01' N. lat. and 105° 17' W. long., at an altitude of 5047 feet. It is a point of distribution for an important mining region, and is entered by the Union Pacific, the Colorado and North-Western, and the Colorado and Southern railways. Population (1880), 3669; (1900), 6150.

Boulogne-sur-Mer, a fortified seaport of France, chief town of arrondissement, department of Pas-de-Calais, 25 miles from Calais by rail. It is 28 miles from Folkestone, with which there is a fixed steamboat service, the average passage occupying one hour and a half. A new deep-sea harbour is in course of construction, affording accommodation for the largest sea-going vessels. The southern pier, the so-called “Mole de Carnot,” has a length of 1½ miles. A new railway station has been opened at the Tintilleries in the upper town on the through main line from Calais to Paris, the old town station being now mostly used for local traffic. Boulogne is rapidly extending northwards up the coast, and is connected by an electric tram-line with the pretty little watering-place, Wimille-Wimereux, 3 miles distant, which thus practically forms a suburb of the larger town. Public institutions include the communal college, schools of practical commerce and industry. The number of volumes in the library has more than doubled, and there are now three other libraries, two museums, and three hospitals. Several

learned societies meet here. Fish-curing occupies several large establishments. The commercial activity of the town is of great and growing importance, and extends to all parts of the world. The numbers of vessels entered and cleared in 1899 (including French coasting vessels) were, respectively, 2946 of 1,295,360 tons, and 2961 of 1,293,270 tons. Of these there entered British vessels 1976 of 548,083 tons, and cleared 1983 of 549,203 tons. Of exports in 1899 wines formed the bulk; next came cement, then potatoes, fresh fruit, and vegetables. The principal imports during the same year were coal and wood coke. The total value of the imports in 1899 was £6,584,000, and of the exports, £12,360,000. The total number of passengers arriving at Boulogne in 1899 was 115,967, and of departures 130,029. In 1899 the fisheries of Boulogne, including the sub-ports of Étaples, Andresselles, Le Partel, and Équihen, employed 400 boats and 5350 men, the value of the fish taken being estimated at £505,680. Steamboats are gradually replacing the smaller sailing boats. Population (1881), 43,954; (1891), 44,340; (1901), 49,083.

Boulogne-sur-Seine. See PARIS.

Bourbaki, Charles Denis Sauter (1816-1897), French general, was born at Pau, 22nd April 1816, being the son of a Greek colonel who died in the War of Independence in 1827. He entered St Cyr, and in 1836 joined the Zouaves, becoming lieutenant of the Foreign Legion in 1838, and aide-de-camp to King Louis Philippe. It was in the African expedition that he first came to the front. In 1842 he was captain in the Zouaves; 1847, colonel of the Turkos; 1850, lieutenant-colonel of the 1st Zouaves; 1851, colonel; 1854, brigadier-general. In the Crimean war he commanded a portion of the Algerian troops; and at the Alma, Inkerman, and Sebastopol Bourbaki's name became famous. In 1857 he was made general of division, commanding in 1859 at Lyons. His success in the war with Italy was only second to that of MacMahon, and in 1862 he was proposed as a candidate for the vacant Greek throne, but declined the proffered honour. In 1870 the emperor entrusted him with the command of the Imperial Guard, and he played an important part in the fighting round Metz. On 25th September Bourbaki escaped from Metz in disguise, though whether his departure was the result of an intrigue on the part of Bazaine or of connivance on the part of the German authorities (who, it is said, were anxious that communications should be opened up with the Empress Eugénie), has not been sufficiently cleared up. At all events it was given out that he had a mission to Chiselhurst, and he went to England with a safe-conduct, but soon returned to France having effected nothing. He offered his services to Gambetta and received the command of the Northern army, but was recalled on 19th November and transferred to the army of the Loire. Towards the end of the siege of Paris he unsuccessfully attempted to create a diversion by cutting the Prussian line at Belfort, but was outmanœuvred by Manteuffel, and driven across the Swiss frontier. His troops were in the most desperate condition, owing to lack of food; and out of 150,000 men under him when he started, only 84,000 escaped from the Germans into Swiss territory. Bourbaki himself, rather than submit to the humiliation of a probable surrender, on 26th January 1871 delegated his functions to General Clinchant, and in the night fired a pistol at his own head, but the bullet, owing to a deviation of the weapon, was flattened against his skull and his life was saved. General Clinchant carried Bourbaki into Switzerland, and he recovered sufficiently to return to France. In July 1871 he again

took the command at Lyons, and subsequently became military governor. In 1881, owing to his political opinions, he was placed on the retired list, together with Generals de Barail, Bataille, and Ducrot. In 1885 he was an unsuccessful candidate for the Senate. He died 27th September 1897. A patriot and a brilliant soldier and leader, Bourbaki was yet not equal to the tasks that fell to his lot; and in this he resembled some other French generals of the Second Empire whose training had been obtained in Africa. (H. CH.)

Bourgeois, Léon Victor Auguste (1851-—), French statesman, was born at Paris, 21st May 1851, and educated for the law. After holding a subordinate office (1876) in the department of public works, he became successively prefect of the Tarn (1882) and the Haute-Garonne (1885), and then returned to Paris to enter the Ministry of the Interior. He became prefect of police in November 1887, at the rather critical moment of President Grévy's resignation. In the following year he entered the Chamber, being elected deputy for the Marne, in opposition to General Boulanger, and joined the Radical Left. He was Under-Secretary for Home Affairs in the Floquet Ministry of 1888, and resigned with it in 1889, being then returned to the Chamber for Reims. In the Tirard Ministry, which succeeded, he was Minister of the Interior, and subsequently Minister of Public Instruction in the Cabinet of M. Freycinet, a post for which he had qualified himself by the attention he had given to educational matters. In this capacity he was responsible in 1890 for some important reforms in secondary education. He retained his office in M. Loubet's Cabinet in 1892, and was Minister of Justice under M. Ribot at the end of that year, when the Panama scandals were making the office one of peculiar difficulty. He energetically pressed the Panama prosecution, so much so that he was accused of having put wrongful pressure on the wife of one of the defendants in order to procure evidence. To meet the charge he resigned in March 1893, but again took office, and only retired with the rest of the Freycinet Ministry. In November 1895 he himself formed a Cabinet of a pronouncedly Radical type, the main interest of which was attached to its fall, as the result of a constitutional crisis arising from the persistent refusal of the Senate to vote Supply. The Bourgeois Ministry appeared to consider that popular opinion would enable them to override what they claimed to be an unconstitutional action on the part of the Upper House; but the public was indifferent and the Senate triumphed. The blow was undoubtedly damaging to M. Bourgeois's career as an *homme de gouvernement*. After officiating as Minister of Public Instruction in the short-lived Brisson Cabinet of 1898, he represented his country with dignity and effect at the Hague Peace Congress.

Bourges, chief town of department Cher, France, 137 miles S. of Paris, on the railway from Paris to Nevers, is the headquarters of the 8th army corps, and its military establishments have become of the very highest importance; they include, amongst other departments, schools of artillery and pyrotechnics, engineering works, and a national cannon foundry. At Mazières also, about 1½ miles S. of Bourges, are very important metallurgical works. Population (1881), 29,001; (1901), 39,822.

Bourget, Paul (1852-—), French novelist and critic, was born at Amiens, 2nd September 1852. His father, a professor of mathematics, was afterwards appointed to a post in the college at Clermont-Ferrand. Here Bourget received his early education. He then proceeded to the college of Sainte-Barbe at Paris, and

followed a course at the Lycée Louis-le-Grand, where he studied with distinction, and passed his first examination with honours. In 1872-73 he produced a volume of verse, *Au bord de la mer*, which was followed by others, the last, *Les Aveux*, appearing in 1882. Meanwhile he was making a name in literary journalism, and in 1883 he published *Essais de Psychologie Contemporaine*, studies of eminent writers first printed in the *Nouvelle Revue*, and now brought together. In 1884 Bourget paid a long visit to England, and there wrote his first published story (*L'Irréparable*). *Cruelle Énigme* followed in 1885; and in 1887 *André Cornelis* and *Mensonges* were received with much favour. *Le Disciple* (1889) showed the novelist in a graver attitude; while in 1891 *Sensations d'Italie*, notes of a tour in that country, revealed a fresh phase of his powers. In the same year appeared the novel *Cœur de Femme*, and *Nouveaux Pastels*, types of the characters of men, the sequel to a similar gallery of female types (*Pastels*, 1890). His later novels include *La Terre Promise* (1892); *Cosmopolis* (1892), a psychological novel, with Rome as a background; *Une Idylle Tragique* (1894); *La Duchesse Bleue* (1897); and some volumes of shorter stories—*Complications Sentimentales* (1896), the powerful *Drames de Famille* (1898), and *Un Homme Fort* (1900). *Études et Portraits*, first published in 1888, contains impressions of Bourget's stay in England and Ireland, especially reminiscences of the months which he spent at Oxford; and *Outre-Mer*, a book in two volumes, is his critical journal of a visit to the United States in 1893. He was admitted to a chair at the Academy in 1894, and in 1895 was promoted to be an officer of the Legion of Honour, having received the decoration of the order ten years before.

As a writer of verse Bourget was merely trying his wings, and his poems are chiefly interesting for the light which they throw upon his mature method and the later products of his art. It was in criticism that his genius first found its true bent. The habit of close scientific analysis which he derived from his father, the sense of style produced by a fine ear and moulded by a classical education, the innate appreciation of art in all its forms, the taste for seeing men and cities, the keen interest in the oldest not less than the newest civilizations, and the large tolerance not to be learned on the *boulevard*—all these combined to provide him with a most uncommon equipment for the critic's task. It is not surprising that the *Sensations d'Italie*, and the various psychological studies, are in their different ways scarcely surpassed throughout the whole range of literature. Bourget's reputation as a novelist has long been assured. Deeply impressed by the singular art of Henry Beyle (Stendhal), he struck out on a new course at a moment when the realist school reigned without challenge in French fiction. His idealism, moreover, had a character of its own. It was constructed on a scientific basis, and aimed at an exactness, different from, yet comparable to, that of the writers who were depicting with an astonishing faithfulness the environment and the actions of a person or a society. With Bourget observation was mainly directed to the secret springs of human character. At first his purpose seemed to be purely artistic, but when *Le Disciple* appeared, the preface to that remarkable story revealed in him an unsuspected fund of moral enthusiasm. Since then he has varied between his earlier and his later manner, but his work in general has been more seriously conceived. From first to last he has figured with a most delicate brush the intricate emotions of women, whether wronged, erring, or actually vicious; and he has described not less happily the ideas, the passions, and the failures of those young men of France to whom he makes special appeal.

Bourget has been charged with pessimism, and with undue delineation of one social class. The first charge can hardly be sustained. The lights in his books are usually low; there is a certain lack of gaiety, and the characters move in a world of disenchantment. But there is no despair in his own outlook upon human destiny as a whole. As regards the other indictment, the early stories sometimes dwell to excess on the mere framework of opulence; but the pathology of moral irresolution, of complicated affairs of the heart, of the ironies of friendship, in which the writer revels, can be more appropriately studied in a cultured and leisured society than amid the simpler surroundings of humbler men and women. The style of all Bourget's writings is singularly graceful. His knowledge of the literature of other lands gives it a greater flexibility and a finer allusiveness than most of his contemporaries can achieve. The precision by which it is not less distinguished, though responsible for a certain over-refinement, and for some dull pages of the novels, is an almost unmixed merit in the critical essays. As a critic, indeed, either of art or letters, Bourget leaves little to be desired. If he is not in the very first rank of novelists, if his books display more ease of finished craftsmanship than joy in spontaneous creation, it must be remembered that the supreme writers of fiction have rarely succeeded as he has in a different field.

Bourke, a town in New South Wales, Australia, 503 miles by rail N.W. from Sydney, on the south bank, and at the head of the ordinary winter navigation, of the Darling river, in the county of Cowper. Remarkably rich copper ore exists in the district (which is also pastoral and agricultural) in great abundance. Population, about 3000.

Bournemouth, a municipal (1890) and county (1900) borough and watering-place in the parliamentary borough of Christchurch, England, 107½ miles S.W. by W. of London by rail. The town has been greatly extended in recent years, and many new streets and villas have been erected, as well as hotels, for the increasing number of visitors that frequent the town. Modern erections include twelve Established churches and several chapels, a science and art school, a public library, two drill halls, the Royal Victoria Hospital, and the Royal Boscombe and West Hants Hospital. The iron pier has been extended to 1000 feet in length. Golf links of 60 acres have been provided in Meyrick Park. The beautiful chines at Boscombe, Alum, and Branksome have attracted a large number of wealthy residents, and Talbot Woods is a favourite resort. Area, 2592 acres; population (1881), 18,607; (1891), 37,781; (1901), 47,003. The urban districts of Pokesdown and Winton, which adjoin Bournemouth on the west and north, were included in the borough in November 1901, and their population is respectively 4930 and 6719. Parts of the rural parishes of Holdenhurst and Southbourne have also been incorporated.

Boussat, Le, a suburban and residential town, department of Gironde, France, in the arrondissement and 3 miles N. by W. of Bordeaux, on electric tramway to Eysines. It has a hydropathic establishment, and the Bordeaux racecourse is here. Population (1881), 3644; (1896), 9234; (1901), 10,462.

Boussu, a town of Belgium, in the province of Hainaut, 7 miles W. of Mons by rail. In its neighbourhood copper-, bronze-, and iron-founding, and sugar manufacture are carried on, also the building of steam-machinery and boats. Mines and quarries are also worked in the vicinity. Population (communal) (1880), 8722; (1897), 10,564.

Bowen, Charles Syngé Christopher, BARON (1835-1894), English judge, was born on 1st January 1835, at Woolaston in Gloucestershire, his father, the Rev. Christopher Bowen of Hollymount, Co. Mayo, being then curate of the parish. At ten years of age Charles Bowen was sent to school at Lille, whence he was transferred to Blackheath proprietary school. In 1850 he went to Rugby, entering the school-house. The master of his first form (the upper fifth) was Bradley, afterwards dean of Westminster, and his tutor was Cotton, afterwards headmaster of Marlborough, and subsequently bishop of Calcutta. At Rugby Bowen had a brilliant career, which he closed by winning a Balliol scholarship in 1863, while he was noted (as he was afterwards at Balliol) as a cricketer and football player. At Oxford he made good the promise of his earlier youth, his principal achievements being the Hertford scholarship 1855, First Class Classical Moderations 1856, Ireland scholarship 1857, Chancellor's prize for Latin verse 1857, First Class in *Lit. Hum.* 1858, Balliol Fellowship 1858, Arnold prize for English essay 1859. He also won the friendship of, among many others, Benjamin Jowett, then tutor, afterwards master of Balliol, a friendship which only ended when Jowett died in 1893, a year before his pupil, who had in 1885 become visitor of the college. From Oxford Bowen went to London, where he was called to the bar at Lincoln's Inn in 1861, and while studying law he wrote regularly for the *Saturday Review*, and also later for the *Spectator*. For a time he had little success at the bar considering his talents, and came near to exchanging it for the career of a college tutor. He had friends, however, who believed in him, and the persuasion of Mr Coleridge, afterwards Lord Chief Justice, the leader of the Western Circuit, which he had joined, and of Mr G. Baugh Allen, a well-known special pleader with whom he had read, and others, induced him to persevere. Soon after he had begun to make his mark he was briefed against the Claimant in the civil and criminal trials connected with the famous "Tichborne Case." Bowen's services to his leader, Sir John Coleridge, during the former helped to procure for him the appointment of junior counsel to the Treasury (known in the legal vernacular as Attorney-General's devil), when Sir John had passed, as he did while the trial proceeded, from the office of Solicitor-General to that of Attorney-General; and from this time his practice became a very large one. The strain, however, of the Tichborne trials had been great, and possibly the combination of severe intellectual effort with the struggle for athletic distinction at school and at college had told upon his constitution, for his physical health became unequal to the tasks which his zeal for work imposed upon it, and in 1879 his acceptance of a judgeship in the Queen's Bench Division, on the retirement of Mr Justice Mellor, gave him the opportunity of comparative rest, while it closed to him the prospect of distinction in politics before he had had time to seek it. The character of Charles Bowen's intellect hardly qualified him for some of the duties of a puisne judge; but it was otherwise when, in 1882, in succession to Lord Justice Holker, he was raised to the Court of Appeal. As a Lord Justice of Appeal he was conspicuous for his learning, his industry, and his courtesy to all who appeared before him; and in spite of failing health he was able to sit more or less regularly until August 1893, when on the retirement of Lord Hannen he was made a Lord of Appeal in ordinary, and a baron for life, with the title of Baron Bowen of Colwood. By this time, however, his health had finally broken down; he never sat as a law lord to hear appeals, and he gave but one vote as a peer, while his last public service consisted in presiding over the Commission which sat in

October 1893 to inquire into the Featherstone riots. He was barely able to attend the meeting held on 2nd December in order to raise a memorial to Dr Jowett, at which both his old friend Lord Chief Justice Coleridge and he, respectively mover and seconder of a resolution as to the disposal of the fund to be raised, made their last speeches in public. Lord Coleridge lived till 14th June, but Lord Bowen became rapidly worse during the early months of 1894, and died on 10th April. He was buried in the churchyard of Slaughtam, near Colwood, his country house in Sussex; and a marble tablet has been erected to his memory in the vestibule of Lincoln's Inn chapel, bearing a Latin inscription from the pen of the Hon. George Denman, formerly a judge of the Queen's Bench Division, and a senior classic, who also died soon afterwards.

Lord Bowen was regarded with great affection by all who knew him either professionally or privately. In the more intellectual circles of English society he had many friends, including Mr Gladstone. He had a polished and graceful wit, of which many instances might be given, although such anecdotes lose force in print. For example, when it was suggested on the occasion of an address to Queen Victoria, to be presented by her judges, that a passage in it, "conscious as we are of our shortcomings," suggested too great humility, he proposed the emendation "conscious as we are of one another's shortcomings"; and on another occasion he defined a jurist as "a person who knows a little about the laws of every country except his own." Of Lord Bowen in the Court of Appeal Lord Davey wrote (*Law Quarterly*, July 1894), "It is upon his work there that his judicial reputation will rest. Law to Bowen was not a mere collection of rules, but was the embodiment of the conscience of the nation. . . . Lord Bowen will be remembered amongst the great judges who steered the ship in the transition from the old system to the new. . . . There will be found in the series of judgments delivered by him a luminous interpretation of legal principles as applied to the facts and business of life, expressed in language worthy even of his literary reputation." Among good examples of his judgment, Lord Davey proceeded to cite that given in advising the House of Lords in *Angus v. Dalton* (6 App. Cas. 740), and those delivered in *Abrath v. North-Eastern Railway* (11 Q.B.D. 440); *Thomas v. Quartermaine* (18 Q.B.D. 685); *Vagliano v. Bank of England* (23 Q.B.D. 243) (in which he prepared the majority judgment of the Court, which was held to be wrong in its conclusion by the majority of the House of Lords); and the *Mogul Steamship Company v. M'Gregor* (23 Q.B.D. 598). Of Lord Bowen's literary works besides those already indicated may be mentioned his translation of Virgil's *Eclogues*, and *Aeneid*, books i.-vi., his article on the "Administration of the Law," contributed to *The Reign of Queen Victoria*, edited by Mr Humphry Ward, and his pamphlet *The Alabama Claim and Arbitration considered from a Legal Point of View*. Lord Bowen married in 1862 Emily Frances, eldest daughter of Mr James Meadows Rendel, F.R.S. (and niece of Mr Stuart Rendel, afterwards raised to the peerage as Baron Rendel), by whom he had issue, William Edward, a clergyman, born 1862, who succeeded to Hollymount; Maxwell Steele, born 1865; and Ethel Kate, born November 1870.

See also *Lord Bowen*, by Sir HENRY STEWART CUNNINGHAM.
(E. A. AR.)

Bowles, Samuel (1826-1878), American journalist, was born in Springfield, Massachusetts, 9th February 1826. He was the son of Samuel Bowles, an editor of the same city, who had established the weekly *Springfield Republican* in 1824. The daily *Republican* was begun in

1844, as an evening newspaper, afterwards becoming a morning journal. To its service Samuel Bowles, junior, devoted his life (with the exception of a brief period during which he was in charge of a daily in Boston), and gave it a national reputation by the vigour, incisiveness, and independence of its editorial utterances, and the concise and convenient arrangement of its local and general news-matter. During the controversies affecting slavery and resulting in the Civil war, Bowles supported, in general, the Whig and Republican parties, but in the period of reconstruction under President Grant his paper represented anti-administration or "Liberal Republican" opinions, while in the disputed election of 1876 it favoured the claims of Tilden, and has since been independent of all party control. He died at Springfield on 16th January 1878. During his lifetime, and subsequently, the *Republican* office became a sort of school for young journalists, especially in the matter of pungency and conciseness of style, one of his maxims being "put it all in the first paragraph." Bowles wrote several ephemeral books of travel in the western part of the United States, but his best work was in the columns of his newspaper. A eulogistic *Life and Times of Samuel Bowles* (2 vols., 1885), by George S. Merriam, is virtually a history of American political movements after the compromise of 1850.

Bowling Green, capital of Warren county, Kentucky, U.S.A., situated on Barren river, at the head of navigation, in the southern part of the state, at an altitude of 468 feet, and on the Louisville and Nashville railway. Population (1880), 5114; (1900), 8226.

Bowling Green, a town of Ohio, U.S.A., capital of Wood county, in the north-western part of the state, 20 miles S. of Toledo, at the intersection of lines of the Cincinnati, Hamilton, and Dayton, and the Toledo and Ohio Central railways. It is in an oil and natural gas region. Population (1890), 3467; (1900), 5067.

Bowls.—Since 1880 there has been a remarkable revival of interest in the game of Bowls in every part of the globe where English-speaking communities are found. In Scotland, so far from passing out of fashion, Bowls, along with its winter analogue of curling, may still be considered the national game, and it is estimated that there are no fewer than 700 Bowling clubs in the country. In Glasgow and the immediate neighbourhood there are some thirty clubs, most of which possess two greens. The Queen's Park and Titwood Clubs, however, have each three greens, and as they can quite comfortably play six rinks on each, it is common to see 144 players making their game simultaneously. In Edinburgh and Leith there are at least thirty clubs, and every town of any consequence boasts one green at all events. But it is in London, where it is difficult to obtain suitable pitches, that the revival in Bowls has been most conspicuous. The day when the pastime was looked upon as a mere "pothouse recreation" has gone for ever, for even in those cases where the greens are still in connexion with the public-houses whose names the clubs bear, they are now rented by the clubs for their own use exclusively. Within the metropolitan area the number of clubs exceeds forty, the majority of them having been founded since 1885. Following the lead of Edinburgh, Glasgow, and other Scottish corporations, the London County Council have laid down greens (as the annexed table shows) in several of the public parks under their control, and have it in contemplation to construct others at Sydenham Wells Park, Brockwell Park, and elsewhere.

With regard to the British colonies a similar tale of progress and popularity has to be recorded. In Australia and New Zealand nearly every little town or village has its Bowling-green, and in Melbourne and Sydney—includ-

ing in both instances the surrounding districts—there are almost as many greens as there are in Glasgow. In Canada the game is being taken up rapidly, although the Dominion is yet a long way behind the Australian Commonwealth in this respect. There is a green in Cape Town, in Port Elizabeth, in Kimberley, and in a few other towns in South

Place.	When Opened.	Size in Yards.	Cost.	Daily No. of Games Played (Average).	Greatest No. of Players at One Time.
Battersea Park	1895	48½ × 34	The actual cost in these cases is not known, as part of the labour was performed by the Council's ordinary staff; but it varied probably from £50 to £90	12	28
Clissold Park	1897	30 × 30		25	32
Dulwich Park	1899	30 × 30		Very irregularly used	
Finsbury Park	1900	36 × 36			46
Ravenscourt Park	1901	40 × 30	£98 (est.)	35	
The Island Gardens, Poplar	1901	40 × 30	£105 (est.)		
Victoria Park	1901	36 × 36	£91 (est.)		

Africa. Calcutta and Hong Kong each possesses a green, and there is one in Kumamoto in Japan. The universality of the game in Greater Britain affords interesting evidence of the fact that the pastime is (within the modern period at any rate) distinctly Scottish, for Caledonian colonists, wherever they settle, give early attention to the constructing of a Bowling-green. This circumstance makes it strange that in the United States the number of clubs is still somewhat limited.

There are two kinds of green—one the *crown*, and the other the *level*. The former is confined almost entirely to Lancashire and Yorkshire and one or two more of the North of England counties. This is the type of green on which most of the gate-money contests take place, the prizes having encouraged a good many players to take up the game professionally. The fall from the "crown" of the green to the ditch may be as much as 18 inches, and the ordinary biased bowls are practically useless on such a pitch. The game upon such a green is of a very sporting character, but its associations must preclude it from ever becoming general. It is the game on the perfectly flat or level green that constitutes the historical game of Bowls, as may be amply proved not only by the hundreds of admirably-kept club greens in Scotland, but also by the fine private greens in connexion with so many of the famous mansions of England, and the beautiful sheets of turf belonging to several of the colleges of Oxford and Cambridge. Subject to the rule as to a *minimum* jack (25 yards, according to the Laws of the Scottish Bowling Association, adopted on 24th April 1893), there is no prescribed size for the green; but 42 yards square would form an ideal green. The Queen's Park Club of Glasgow have one green of about 47 yards square, big enough, that is, to accommodate seven rinks. A really under-sized green is a poor pitch, because it commonly involves playing diagonally instead of up and down—the orthodox direction. The construction of a green scientifically is a heavy undertaking, which only wealthier clubs can face. The ground for the whole of its extent must be excavated to a depth of two feet or so, well drained, and layers of different materials (gravel, cinders, mould, silver sand) laid down before the final covering of turf. Seaside

turf is the best of all. It wears longest, and keeps its "spring" to the last. At one time the clubs in Glasgow and Ayrshire obtained turf from the coast near Ayr or Irvine, but after the shore had been stripped of the most suitable grass, clubs of later date went as far as Islay and the Solway to procure good sea-turf. Much of the latter is under water every tide. It answers its purpose excellently in Glasgow, but possibly does best in some such "soft" climate as the West of Scotland too consistently offers. Turf like this is not generally obtainable, and becomes so costly an item in the contractor's tender that poorer clubs have to be satisfied with much commoner and more ordinary turf. The mere difference in turf, however, measures the difference between a Glasgow green and a London one, or, in other words, between a game of skill and a game largely of luck.

It is the rougher green in many parts of London and the South of England that has necessitated a modification of the Scottish practice of play, which otherwise would unquestionably govern every club in the world. In Scotland the custom is to play rinks of four a-side—the players being called leader, second player, third player, and driver or skip—which gives rise on a fine green to a beautiful display of keen and accurate Bowling. On the inferior greens of the majority of London clubs, though such a system would be quite possible—and is often adopted in friendly games—it cannot be said that the play would be either scientific or satisfactory. In these cases, accordingly, the rule is to play rinks of only two a-side in matches. On the other hand, in the Colonies, where the greens closely approximate the quality of the Scottish greens, the Scottish practice is almost invariably followed.

In theory the game of Bowls is simplicity itself, the aim of the player being to deliver his ball from the "footer" or mat with sufficient strength and bias to cause it to rest nearer to the jack than his opponent's bowl. But in practice there is plenty of scope for skill. The leader's business is to "be up." There is no excuse for short play on the part of the first players; their bowls would be far better in the ditch. It is their plain duty to be on the jack, the ideal position being a bowl at rest immediately behind the tee. It is customary for the skip, or driver, to direct his men from the end that is being played to, and they must do precisely as they are bidden. The player who disobeys orders, whatever his individual merits, will be of little use in a team. The skip, having carefully noted the lie of the different bowls, then takes his place at the footer, and acts according to the position of the "wood" around the jack. It may be that he has to throw away his bowl, or to draw a shot with the utmost nicety, or even to "fire." Judgment and nerve are all-in-all in a skip. When the foe are lying massed around the jack, and the draws are all blocked, it is sometimes the wisest plan for the skip to "fire"—that is, to deliver his bowl almost dead straight, and with enough force to kill the bias for the moment—and scatter his enemies. Ignorant onlookers or irritated players may describe this as "skittles," but there are situations in which it is absolutely the correct thing to do; and the skip who has the pluck to do it deserves to be commended for his indifference to sneers and his desire to win the end.

In a general way the Bowling season runs from May-day till the end of September or the middle of October. When the season is closed the green should be carefully examined. Weeds must be uprooted, worn patches re-turfed, and if the whole can then be laid under a winter blanket of silver sand, by the following spring this will all have been absorbed and the elasticity of the pitch restored. During the season the ground-man will of course be on duty constantly, and in most clubs it is the

rule to appoint a "green rota" of members, who undertake a superintendence of the green week by week, and who have, amongst other matters, occasionally to decide whether or not, having regard to the state of the weather, play should be allowed.

Bowls has now been provided with a code of laws as full and as far-reaching as the laws which govern cricket. The rules and regulations of the Scottish Bowling Association, so far at any rate as principles are concerned, have been cordially accepted. In certain details, as has already been indicated, modifications have been introduced which do not, however, imperil the cardinal features of the game. The dimensions of a rink are laid down, the maximum circumference of the bowl is fixed at $16\frac{1}{2}$ inches, and unbiassed bowls are forbidden. A game consists of any number of ends or points agreed upon, or for a specified length of time. In clubs following the Scottish code, 25 ends, or heads, a rink is the ordinary practice; but most of the London and many English provincial clubs prefer 21 points a rink for match play, championships, and handicaps. There are obvious objections to playing matches by time, and this is consequently seldom adopted. In Scotland a full rink consists of four men a-side, each playing two bowls, but in a "pairs" game (two against two) each player uses four bowls. Thus the same aggregate number of bowls (8) is employed in both games. But, as we have said, many London clubs, for good and sufficient reasons in their case, play only two men a-side in matches, and in "friendlies" it is rare indeed to see players use four bowls each on English greens. Probably most difference of opinion has arisen over what constitutes a *minimum* and *maximum* jack. In the Scottish rules the former is fixed at 25 yards, but several English clubs prefer a shorter distance. The latter is usually fixed at six feet from the ditch, but the Scottish rules seem to be singularly lax on the subject, for they declare that "when thrown less than two yards from the ditch it should be *moved out* to that distance," and if it run to the side "it shall be *moved out* and placed in a straight line between the pins numbering the rinks." This handling of the jack by any person but the thrower is, in the view of the South London Association of Bowling Clubs, itself an illegal act, and neither logical nor sportsmanlike, and it is difficult to reject this contention. It is of interest, in this connexion, to note that the Australian Bowlers who visited the United Kingdom in 1901 considered that the practice of bowling to jacks of uniform length was far too common on British greens and did not make for the best possible game. Another question upon which doctors differ is as to the condition of the jack after it has been driven into the ditch. Unless it has been forced clean out of bounds, such a jack is still alive, according to Scottish rules. On nearly all English greens it is a dead jack, and the end "no end." English practice here seems preferable. Nor has the Scottish doctrine of "touchers" proved generally acceptable south of the Cheviots. A bowl which, during its original course, touches the jack, is called a toucher, and counts in the game even should it run into the ditch, or be driven in by another bowl. For the purpose of this and other laws, the Scottish Association holds that the ditch within the limits of the rink is part of the green so far as the jack and touchers are concerned. It is a comparatively easy feat for early players in a rink to touch the jack, and no special reward seems called for by this exhibition of commonplace dexterity. Moreover, the ditch seems to be the ditch and not the green. The last law in the Scottish code might be universally adopted and rigidly enforced. "Persons not engaged in the game," it runs, "must confine themselves to the banks and preserve an attitude of strict

neutrality." On most London greens this rule is more honoured in the breach than in the observance.

All clubs look to the Scottish Bowling Association, the headquarters of which are in Glasgow, as the leading legislative authority. Other important bodies are the London and Southern Counties Bowling Association, the South London Association of Bowling Clubs, and the Imperial Bowling Association, besides numerous county associations, which are nearly all affiliated to one or other of the main bodies. The first-named body was founded in October 1895 at the instigation of Mr Ernest C. Price, the then president of the Brownwood Bowling Club of Finsbury, an enthusiast who thought the time had come for codifying and fixing the laws which should govern the game, at least in the South of England, and already most of the strongest and most representative Southern clubs have joined the Association. Another body which aimed at drawing up common rules for match play was the South London Association of Bowling Clubs, started in 1898 on the suggestion of Mr Joseph Hay, captain of the Temple Bowling Club of Camberwell. The chief question with

which this association was confronted was the important point whether or not the Scottish rules should be adopted *en bloc*. It was felt that, in view of the comparatively rough condition of many of the South London greens and the small dimensions of some of them, it was not possible to accept several of the Scottish details of play, and accordingly a separate body was needed to legislate for these special circumstances. Under the rules of this Association, therefore, matches with affiliated clubs are played in rinks of two a-side, 21 points up. The Imperial Association was founded in 1899 with the twofold object, first, of promoting intercolonial matches and tournaments, home and away, and secondly, of codifying the laws of the game, which should be binding on the players in all such matches and tournaments, and which, the hope was cherished, might also become recognized by every club in the British empire and elsewhere as the final laws of Bowls. The earl of Jersey, who had been governor-general of New South Wales from 1890 to 1893, and was himself an expert player, accepted the post of president, and lent the Association efficient support. Laws, mainly based

FIG. 3.—Trailing.

FIG. 4.—Driving.

upon the Scottish code, were drawn up and submitted to the leading colonial clubs. But the principal difficulty was a practical one, namely, the means of defraying the expenses of visiting teams. Fortunately for the game, gate-money contests have never come into vogue, and consequently funds from this source were not available. Though the question had to be left unsettled, and mainly to be dealt with by the respective clubs, there appeared to be no substantial reason against holding periodically matches of an exceptionally interesting character, in which the best talent of the Colonies and the Mother Country should be pitted against each other. The visit of Bowlers from the States of Australia and New Zealand in 1901, already alluded to, was one outcome of the energies of the Imperial Bowling Association. On broader grounds, the visit was nothing short of a landmark in the history of the game.

On Scottish greens the game of Points is occasionally played, but it is rarely seen on English greens. Its main object seems to be to perfect the proficiency of players in certain departments of Bowls proper. There are four sections in the game, namely, drawing, guarding, trailing, and driving. In *drawing* (Fig. 1), the object is to draw as near as possible to the jack, the player's bowl passing outside of two other bowls placed five feet apart in a horizontal line fifteen feet from the tee, without touching either of them. Three points are scored if the bowl come to rest within one foot of the jack, two points if within two feet, and one point if within three feet. Circles of these radii are usually marked around the jack for convenience' sake. In *guarding* (Fig. 2), two jacks are

laid at the far end of the green twelve feet apart in a vertical line. A thread is then pinned down between them, and on each side of this thread three others are pinned down parallel with it and six inches apart from each other. A bowl that comes to rest on the central line, or within six inches of it, counts three points, a bowl twelve inches away two points, and a bowl eighteen inches off one point. In *trailing* (Fig. 3), two bowls are laid on the turf three feet apart, and straight lines are chalked from bowl to bowl across their back and front faces, and a jack is then deposited equidistant from each bowl and immediately before the front line. A semicircle is then drawn behind the bowls with a radius of nine feet from the jack. Three points are given to the bowl that trails the jack over both lines into the semicircle and goes over them itself. If a bowl trail the jack over both lines, but only itself cross the first; or if it pass both lines, but the jack cross only the first, two points are awarded. A bowl passing between the jack and either of the stationary bowls, and passing over the back line; or touching the jack, yet not trailing it past the first line, but itself crossing the back line; or trailing the jack over the front line without crossing it itself, receives one point. In no case must the stationary bowls be touched, or the semicircle crossed by the trailed jack or played bowls. In *driving* (Fig. 4), two bowls are laid down two feet apart, and then a jack is placed in front of them, fifteen inches apart from each, and occupying the position of the apex of an inverted pyramid. The player who drives the jack into the ditch between the two bowls scores three. If he moves the jack, but does not carry it through to the ditch, he scores two. If he pass between the jack and either bowl he scores one, although it is not easy to see what driving he has done. The played bowl must itself run into the ditch without touching either of the stationary bowls. It is obvious that the Points game demands an ideally perfect green.

Boyaca, a department of the Republic of Colombia, bounded on the N. by the department of Santander and Venezuela, on the S. by Cundinamarca, and on the W. by Cundinamarca, Santander, and Antioquia. Area, 33,300 square miles; population, 508,000. The capital, Tunja, has 6000 inhabitants, and amongst other towns are Chiquinquirá, Santa Rosa, Sogamoso, Moreno.

Bozrah, (1) in Edom, now *el-Buseireh*, south-east of the Dead Sea, in the broken country on the west side of the Edomite plateau. (2) In the *Mishor*, or "plain country" of Moab, perhaps Kesûr el-Besheir. Whether *Bostra*, the *Bosora* of 1 Macc. v. 26, now Busrá, in the Haurán south of Damascus, was originally called Bozrah is uncertain. From its position it may be inferred that it was a place of importance at a very early period.

Brabant, North, the northern half of the former duchy of that name (the southern portion of which belongs to Belgium), and the largest province of the Netherlands. The south-eastern part of the province differs in every respect from the north-western, being higher (on the frontier, 85-100 feet), on diluvial sand (with occasional clay and loam in the sub-soil and on the banks of the smaller rivers), covered with heath and fens (the *peel*) and waste grounds (25 per cent. of the province), growing only potatoes, rye, and buck-wheat, and inhabited by a scanty, poor population of Roman Catholics. The north-western portion, on the other hand, consists of flat alluvial land (3-16 feet in altitude), has more and larger rivers (the Maas, Dieze, Mark, and Donge) and towns ('S Bosch, Breda, &c.), more fertile land, growing wheat and beetroot, a denser and Protestant population, and holds commercial communication by river and railway with the provinces of Holland, Zeeland, and Gelderland. Area, 1980 square miles; population (1899), 553,845.

Brabant, South, a central province of Belgium, bordering on the provinces of Antwerp, Limbourg, Liège, Namur, Hainaut, and E. Flanders. It is formed of the southern part of the ancient duchy, which extended to the Lower Meuse north of Bois-le-Duc. In the time of the first kingdom of the Netherlands (1815-30), Northern Brabant was distinguished from Southern Brabant, and separated from it by the province of Antwerp. The surface presents plateaux of more than 300 ft. high (as much as 443 ft. at Waterloo) and ramifications of hills. The soil is generally fertile. The province has important paving- and building-stone quarries, numerous breweries and distilleries, beetroot-sugar refineries, and paper-mills. It is divided into the three administrative arrondissements of Brussels, Louvain, and Nivelles, and covers 1268 square miles; population (1899), 1,281,000 (or 1010.2 per square mile), against 959,800 in 1875. The arrondissement of Brussels alone has a population of 871,000, or 2035.7 to the square mile.

Brachiopoda.—Since the publication of the ninth edition of this Encyclopædia, though much has been written on Brachiopoda, little real advance has been made in our knowledge of the affinities and embryology of the group. On the other hand, our knowledge of the histology and structure of the adult has been materially increased by the researches of van Bemmelen (*Jena Zeitschr.* xvi. 1883), followed by Shipley (*Mt. Stat. Neapel.* iv. 1883), Schulgin (*Zeitschr. wiss. Zool.* xli. 1885), Joubin (*Arch.*

Zool. exp. (2) iv. 1886), culminating in the exhaustive papers of Blochmann (*Untersuchungen über den Bau der Brachiopoden*, Th. i., 1892; Th. ii., 1900), which unfortunately at present deal only with *Crania*, *Discinisca*, and *Lingula*. Numerous dredging operations have added to what is known of the distribution and, to some extent, of the habits of the Brachiopoda. In particular François (*Arch. Zool. exp.* (2) ix. 1891) has given a good description of the mode of life of *Lingula*. The works on fossil Brachiopods which have appeared within the period named amount to hundreds, and are far too numerous to mention. American naturalists have been particularly active, and their labours have resulted in the system of classification given below. Beecher (*Amer. Jour. Sci.* Ser. 3, xli. and xlv.) suggested the four orders amongst which in 1893 Schuchert (*Amer. Geol.* xi. and xiii.; *Bull. U.S. Geol. Survey*, No. 87, 1897) arranged all the known genera of Brachiopods. The latest views on the classification are expressed in the latter author's work published in 1897. An excellent summary of this side of the question is presented in Wood's *Palæontology*, and on a more extensive scale in the article "Brachiopoda" by Schuchert in the English edition of von Zittel's *Palæontology*.

Cœlomic Spaces.

—With regard to morphology, the chief points in which Davidson's account of the group (see *Ency. Brit.* vol. iv.) has received amplification are the nature of the several cavities in the body and in the arms, the structure of the vascular system and of the nervous system, and the histology of the various tissues. The spaces in the body of a Brachiopod are cœlomic in nature. The cœlom, the walls of which give rise to the reproductive cells and the cavity of which opens to the exterior through the nephridia, is a spacious chamber surrounding the alimentary canal, and is continued dorsally and ventrally into the sinuses of the mantle (Fig. 1).

FIG. 1.—A diagram of the left half of a *Megathyris* (*Argiope*), which has been bisected in the median plane. 1, the ventral valve; 2, the dorsal valve; 3, the pedicle; 4, the mouth; 5, lip which overhangs the mouth and runs all round the lophophore; 6, tentacles; 7, ovary in dorsal valve; 8, liver diverticula; 9, ocellus muscle—its double origin is shown; 10, internal opening of left nephridium; 11, external opening of the same; 12, ventral adjustor; 13, divaricator muscle; 14, sub-oesophageal nerve ganglion; 15, the heart; 16, dorsal adjustor muscle.

Some of the endothelial cells lining the cœlom are ciliated, the cilia keeping the fluid contents in movement. Others of the endothelial cells show a great tendency to form muscle fibres. Besides this main cœlomic cavity there are certain other spaces which Blochmann regards as cœlomic, but it must be remembered that his interpretation rests largely on histological grounds, and at present embryological confirmation is wanting. These

spaces are as follows:—(i.) the great arm-sinus; (ii.) the small arm-sinus together with the central-sinus and the peri-cesophageal sinus, and in *Discinisca*, and *Lingula*, and, to a less extent, in *Crania*, the lip-sinus; (iii.) certain portions of the general body cavity which in *Crania* are separated off and contain muscles, &c.; (iv.) the cavity of the stalk when such exists. The great arm-sinus of each side of the lophophor lies beneath the fold or lip which together with the tentacles forms the ciliated groove in which the mouth opens. These sinuses are completely shut off from all other cavities, they do not open into the main coelomic space nor into the small arm-sinus, nor does the right sinus communicate with the left. The small

FIG. 2.—Diagrammatic section through an arm of the lophophor of *Crania*. Magnified; after Blochmann. 1, the lip; 2, the base of a tentacle bisected in the middle line; 3, great arm-sinus; 4, small arm-sinus, containing muscle-fibres; 5, tentacular canal; 6, external tentacular muscle; 7, tentacular blood-vessel arising from the cut arm-vessel in the small arm-sinus; 8, chief arm-nerve; 9, secondary arm-nerve; 10, under arm-nerve.

arm-sinus runs along the arms of the lophophor at the base of the tentacles, and gives off a blind diverticulum into each of these. This diverticulum contains the blood-vessel and muscle-fibres (Fig. 2). In the region of the mouth where the two halves of the small arm-sinus approach one another they open into a central sinus lying beneath the cesophagus and partly walled in by the two halves of the ventral mesentery. This sinus is continued round the cesophagus as the peri-cesophageal sinus, and thus the whole complex of the small arm-sinus has the relations of the so-called vascular system of a Sipunculid. In *Crania* it is completely shut off from the main coelom, but in *Lingula* it communicates freely with this cavity. In *Discinisca* and *Lingula* there is further a lip-sinus or hollow system of channels which traverses the supporting tissue of the edge of the mantle and contains muscle-fibres. It opens into the peri-cesophageal sinus. It is better developed and more spacious in *Lingula* than in *Discinisca*. In *Crania*, where only indications of the lip-sinus occur, there are two other closed spaces. The posterior occlusor muscles lie in a special closed space which Blochmann also regards as coelomic. The posterior end of the intestine is similarly surrounded by a closed coelomic space known as the peri-anal sinus in which the rectum lies freely, unsupported by mesenteries. All these spaces contain a similar coagulable fluid with sparse corpuscles, and all are lined by ciliated cells. There is further a great tendency for the endothelial cells to form muscles, and this is especially pronounced in the small arm-sinus, where a conspicuous muscle is built up. The mantle-sinuses which form the chief spaces in the mantle are diverticula of the main coelomic cavity. In *Discinisca* they are provided with a muscular valve placed at their point of origin. They contain the same fluid as the general coelom. The stalk is an extension of the ventral

body-wall, and contains a portion of the coelom which, in *Discinisca* and *Lingula*, remains in communication with the general body-cavity.

Circulatory System.—The structures mentioned in the article BRACHIOPODA of the ninth edition as pseudo-hearts have been shown by Huxley to be nephridia; the true heart was described and figured by Hancock, but has in many cases escaped the observation of later zoologists. Blochmann in 1884, however, observed this organ in the living animal in species of the following genera:—*Terebratulina*, *Magellania* (*Waldheimia*), *Rhynchonella*, *Megathyris* (*Argiope*), *Lingula*, and *Crania* (Fig. 1). It consists of a definite contractile sac or sacs lying on the dorsal side of the alimentary canal near the cesophagus, and in preparations of *Terebratulina* made by quickly removing the viscera and examining them in sea-water under a microscope, he was able to count the pulsations, which followed one another at intervals of 30-40 seconds.

A vessel—the dorsal vessel—runs forward from the heart along the dorsal surface of the cesophagus. This vessel is nothing but a split between the right and left folds of the mesentery, and its cavity is thus a remnant of the blastocoel. A similar primitive arrangement is thought by Blochmann to obtain in the genital arteries. Anteriorly the dorsal vessel splits into a right and a left half, which enter the small arm-sinus and, running along it, give off a blind branch to each tentacle (Fig. 1). The right and left halves are connected ventrally to the cesophagus by a short vessel which supplies these tentacles in the immediate neighbourhood of the mouth. There is thus a vascular ring around the cesophagus. The heart gives off posteriorly a second median vessel which divides almost at once into a right and a left half, each of which again divides into two vessels which run to the dorsal and ventral mantles respectively. The dorsal branch sends a blind twig into each of the diverticula of the dorsal mantle-sinus, the ventral branch supplies the nephridia and neighbouring parts before reaching the ventral lobe of the mantle. Both dorsal and ventral branches supply the generative organs.

The blood is a coagulable fluid. Whether it contains corpuscles is not yet determined, but if so they must be few in number. It is a remarkable fact that in *Discinisca*, although the vessels to the lophophor are arranged as in other Brachiopods, no trace of a heart or of the posterior vessels has as yet been discovered.

The nervous system of Brachiopods has, as a rule, maintained its primitive connexion with the external epithelium. In a few places it has sunk into the connective-tissue supporting-layer beneath the ectoderm, but the chief centres still remain in the ectoderm, and the fibrils forming the nerves are for the most part at the base of the ectodermal cells. Above the cesophagus is a thin commissure which passes laterally into the chief arm-nerve. This latter includes in its course numerous ganglion cells, and forms, according to Blochmann, the immensely long drawn out supra-cesophageal ganglion. The chief arm-nerve traverses the lophophor, being situated between the great arm-sinus and the base of the lip (Figs. 2 and 3); it gives off a branch to each tentacle, and these all anastomose at the base of the tentacles with the second nerve of the arm, the so-called secondary arm-nerve. Like the chief arm-nerve, this strand runs through the lophophor, parallel indeed with the former except near the middle line, where it passes ventrally to the cesophagus. The lophophor is supplied by yet a third nerve, the under arm-nerve, which is less clearly defined than the others, and resembles a moderate aggregation of the nerve fibrils, which seem everywhere to underlie the ectoderm, and which in a few cases are gathered up into

nerves. The under arm-nerve, which lies between the small arm-sinus and the surface, supplies nerves to the muscles of both arm-sinuses (Figs. 2 and 3). Medianly, it has its origin in the sub-oesophageal ganglion, which,

FIG. 3.—Diagram of nervous system of *Crania*; from the dorsal side. The nerves running to the dorsal parts are white, with black edges; those running to the ventral parts are solid black. Magnified; after Blochmann. 1, oesophagus; 2, supra-oesophageal commissure; 3, circum-oesophageal commissures; 4, underarm-nerve; 5, great arm-sinus; 6, small arm-sinus; 7, tentacle; 8, lip of lophophor; 9, infra-oesophageal commissure; 10, chief arm-nerve; 11, secondary arm-nerve; 12, nerves to tentacles; 13, sub-oesophageal ganglion; 14, dorsal lateral nerve; 15, sub-oesophageal portion of the secondary arm-nerve; 16, median pallial nerve of dorsal lobe of mantle; 17, anterior oculus muscle; 18, posterior oculus muscle; 19, obliquus superior muscle; 20, levator brachii muscle.

(i.) the median pallial nerve to the middle of the dorsal mantle; (ii.) numerous small nerves—the circum-oesophageal commissures—which pass round the oesophagus to the chief arm-nerve or supra-oesophageal ganglion; (iii.) the under arm-nerve to the lophophor and its muscles; (iv.) the lateral pallial nerve to the sides of the dorsal mantle. Laterally, the sub-oesophageal ganglia give off (v.) nerves to the ventral mantle, and finally they supply (vi.) branches to the various muscles. There is a special marginal nerve running round the edge of the mantle, but the connexion of this with the rest of the nervous system is not clear; probably it is merely another concentration of the diffused sub-ectodermal nervous fibrils.

The above account applies more particularly to *Crania*, but in the main it is applicable to the other Inarticulata which have been investigated. In *Discinisca* and *Lingula*, however, the sub-oesophageal ganglion is not drawn out, but lies medianly; it gives off two posteriorly-directed nerves to the stalk, which in *Lingula* unite and form a substantial nerve. Sense organs are unknown in the adult.

The histology of Brachiopods presents some peculiar and many primitive features. As a rule the cells are minute, and this has especially stood in the way of embryological research. The plexus of nerve-fibrils which underlie the ectoderm and are in places gathered up into nerves, and the great development of connective tissue, are worthy of notice. Much of the latter takes the form of hyaline supporting tissue, embedded in which are scattered cells and fibres. The lophophor and stalk are largely composed of this tissue. The ectodermal cells are large, ciliated, and amongst the ciliated cells glandular cells are scattered. The chitinous chaetae have their origin in special ecto-

dermal pits, at the base of which is one large cell which is thought to secrete the chaeta, as in Chaetopods. These pits are not isolated, but are connected by an ectodermal ridge, which grows in at the margin of the mantle and forms a continuous band somewhat resembling the ectodermal primordium of vertebrate teeth.

In spite of some assertions to the contrary, all the Brachiopods which have been carefully investigated have been found to be male or female. Hermaphrodite forms are unknown.

Embryology.—Little real advance has been made in our knowledge of the embryology of the Brachiopoda within recent years. Kovalevsky's researches (*Izv. Obshch. Moskov. xiv. 1874*) on *Argiope* (*Megathyris*) are still the most complete as regards the earlier stages. Segmentation is complete, a gastrula is formed, the blastopore closes, the archenteron gives off two coelomic sacs which, as far as is known, are unaffected by the superficial segmentation of the body that divides the larva into three segments. The walls of these sacs give rise at an early stage to muscles which enable the parts of the larva to move actively on one another (Fig. 4, B). About this stage the larvæ leave the brood-pouch, which is a lateral or median cavity in the body of the female, and lead a free swimming life in the ocean. The anterior segment broadens and becomes umbrella-shaped; it has a powerful row of cilia round the rim and smaller cilia on the general surface. By the aid of these cilia the larva swims actively, but owing to its minute size it covers very little distance, and this probably accounts for the fact that where Brachiopods occur there are, as a rule, a good many in one spot. The head bears four eye-spots, and it is continually testing the ground (Fig. 4, A, C). The second segment grows downwards like a skirt surrounding the third segment, which is destined to form the stalk. It bears at its rim four bundles of very pronounced chaetae. After a certain time the larva fixes itself by its stalk to some stone or rock, and the skirt-like second segment turns forward over the head and forms the mantle. What goes on within the mantle is unknown, but presumably the head is absorbed. The chaetae drop off, and the lophophor is believed to arise from thickenings which appear in the dorsal mantle lobe. Recently the Plankton Expedition has brought back, and Simroth (*Ergeb. Plankton Expedition, ii. 1897*) has described, a few larval Brachiopods of undetermined genera, two of which at least were pelagic, or at any rate taken far from the coast. These

FIG. 4.—Three larvæ stages of *Megathyris* (*Argiope*). A, larva which has just left brood-pouch; B, longitudinal section through a somewhat later stage; C, the fully-formed embryo just before fixing—the neo-embryo of Beecher. Highly magnified. 1, anterior segment; 2, second or mantle-forming segment; 3, third or stalk-forming segment; 4, eye-spots; 5, setae; 6, nerve mass (?); 7, alimentary canal; 8, muscles.

larvæ, which resemble those described by Fritz Müller (*Arch. Naturg. 1861-62*), have their mantle turned over their head and the larval shell well developed. No stalk has been seen by Simroth or Fritz Müller, but in other respects the larva resembles the stages in the development.

of *Megathyris* and *Terebratulina* which immediately precede fixation. The cirri or tentacles, of which three or four pairs are present, are capable of being protruded, and

FIG. 5.—Stages in the fixing and metamorphosis of *Terebratulina*. Highly magnified; from Morse. A, larva (neo-embryo) just come to rest; B, C, D, stages showing the turning forward of the second or mantle segment; E, completion of this; F, young Brachiopod. 1, 2, 3, the first, second, and third segments.

the minute larva swims by means of the ciliary action they produce. It can retract the tentacles, shut its shell, and sink to the bottom.

Beecher (*Amer. Jour. Sci., loc. cit.*) has classified with appropriate names the various stages through which Brachiopod larvae pass. The last stage, that in which the folds of the second

segment are already reflected over the first, he calls the Typembryo. Either before or just after turning, the mantle develops a larval shell termed the protegulum, and when this is completed the larva is termed the Phylembryo. By this time the eyes have disappeared, the four bundles of chætæ have dropped off, and the lophophor has begun to appear as an outgrowth of the dorsal mantle-lobe. The protegulum has been found in members of almost all the families of Brachiopoda, and it is thought to occur throughout the group. It resembles the shell of the Cambrian genus *Paterina*, and the Phylembryo is frequently referred to as the *Paterina* stage. In some orders the Phylembryo is succeeded by an *Obolella* stage with a nearly circular outline, but this is not universal. The larva now assumes specific characters and is practically adult.

Classification.—Beecher's division of the Brachiopoda into four orders is based largely on the character of the aperture through which the stalk or pedicle leaves the shell. To appreciate his diagnoses it is necessary to understand certain terms, which unfortunately are not used in the same sense by all authors. The triangular pedicle-opening seen in *Orthis*, &c., has been named by Hall and Clarke the delthyrium. In some less primitive genera, e.g., *Terebratula*, that type of opening is found in the young stages only; later it becomes partly closed by two plates which grow out from the sides of the delthyrium. These plates are secreted by the ventral lobe of the mantle, and were named

FIG. 6.—Shell of larval Brachiopod. Phylembryo stage. $\times 90$; from Simroth. 1, protegulum; 2, permanent shell.

by von Buch in 1834 the "deltidium." The form of the deltidium varies in different genera. The two plates may meet in the middle line, and leave only a small oval opening near the centre for the pedicle, as in *Rhynchonella*; or they may meet only near the base of the delthyrium forming the lower boundary of the circular pedicle-opening, as in *Terebratula*; or the right plate may remain quite distinct from the left plate, as in *Terebratella*. The pro-deltidium, a term introduced by Hall

and Clarke, signifies a small embryonic plate originating on the dorsal side of the body. It subsequently becomes attached to the ventral valve, and develops into the pseudo-deltidium, in the Neotremata and the Protremata. The pseudo-deltidium (so named by Brown in 1862) is a single plate which grows from the apex of the delthyrium downwards, and may completely close the aperture. The pseudo-deltidium is sometimes reabsorbed in the adult. In the Telotremata neither pro-deltidium nor pseudo-deltidium is known. In the Atremata the pro-deltidium does not become fixed to the ventral valve, and does not develop into a pseudo-deltidium. The American use of the term deltidium for the structure which Europeans call the pseudo-deltidium makes for confusion. The development of the brachial supports has been studied by Friele, Fischer, and Oehlert. A summary of the results is given by Beecher (*Trans. Connect. Acad. ix., 1893*).

FIG. 7.—Diagram of the pedicle-opening of *Rhynchonella*. Magnified. 1, umbo of ventral valve; 2, deltidium; 3, margin of delthyrium; 4, pedicle-opening; 5, dorsal valve.

The orders Atremata and Neotremata are frequently grouped together, as the sub-class Inarticulata or Ecardines—the Tretenterata of Davidson—and the orders Protremata and Telotremata, as the Articulata or Testicardines—the Clistenterata of Davidson. The following scheme of classification is based on Beecher's and Schuchert's. Most of the families mentioned are described by Davidson. Recent families are printed in *italic type*.

ORDER I. Atremata (Beecher).—Inarticulate Brachiopoda, with the pedicle passing out between the umbones, the opening being shared by both valves. Pro-deltidium attached to dorsal valve. **FAMILIES.**—*PATERINIDÆ*, *OBOLIDÆ*, *TRIMERELLIDÆ*, *LINGULELLIDÆ*, *LINGULIDÆ*, *LIGULASMATIDÆ*.

ORDER II. Neotremata (Beecher).—More or less circular, cone-shaped inarticulate Brachiopoda. The pedicle passes out at right angles to the plane of junction of the valves of the shell; the opening is confined to the ventral valve, and may take the form of a slit, or may be closed by the development of a special plate called the listrium, or by a pseudo-deltidium. Pro-deltidium attached to ventral valve. **FAMILIES.**—*ACROTRETIDÆ*, *SIPHONOTRETIDÆ*, *TREMATIDÆ*, *DISCINIDÆ*, *CRANIDÆ*.

ORDER III. Protremata (Beecher).—Articulate Brachiopoda, with pedicle-opening restricted to ventral valve, and either open at the hinge line or more or less completely closed by a pseudo-deltidium, which may disappear in adult. The pro-deltidium originating on the dorsal surface later becomes ankylosed with the ventral valve. **FAMILIES.**—*KUTORGINIDÆ*, *EICHWALDIIDÆ*, *BILLINGSSELLIDÆ*, *STROPHOMENIDÆ*, *THECIDIIDÆ*, *PRODUCTIDÆ*, *RICHTHOFFENIDÆ*, *ORTHOIDÆ*, *OLITAMBONITIDÆ*, *SYNTROPHIIDÆ*, *PORAMBONITIDÆ*, *PENTAMERIDÆ*.

ORDER IV. Telotremata (Beecher).—Articulate Brachiopoda, with the pedicle-opening, confined in later life to the ventral valve, and placed at the umbo or beneath it. Deltidium present, but no pro-deltidium. Lophophor supported by calcareous loops, &c. **FAMILIES.**—*PROTORHYNCHIDÆ*, *RHYNCHONELLIDÆ*, *CENTRONELLIDÆ*, *TREBRATULIDÆ*, *STRINGOCEPHALIDÆ*, *MEGALANTERIDÆ*, *TREBRATELLIDÆ*, *ATRYPIDÆ*, *SPIRIFERIDÆ*, *ATHYRIDÆ*.

Affinities.—Little light has been thrown on the affinities of the Brachiopoda by recent research, though speculation has not been wanting. Brachiopods have been at various times placed with the Mollusca, the Chætopoda, the Chætognatha, the Phoronidea, the Polyzoa, the Hemichordata, and the Urochordata. None of these alliances have borne close scrutiny. The suggestion to place Brachiopods with the Polyzoa, *Phoromis*, *Rhabdopleura*, and *Cephalodiscus* in the Phylum Podaxonia made in volume xix. of the ninth edition (pp. 440-41) has not met with acceptance, and until we have a fuller account of the embryology of some one form, preferably an Inarticulate, it is wiser to regard the group as a very isolated one.

It may, however, be pointed out that Brachiopods seem to belong to that class of animal which commences life as a larva with three segments, and that tri-segmented larvæ have been found now in several of the larger groups.

Distribution.—Brachiopods first appear in the Lower Cambrian, and reached their highest development in the Silurian, from which upwards of 2000 species are known, and were nearly as numerous in the Devonian period; at present they are represented by some 140 recent species. The following have been found in the British area, as defined by Norman, *Terebratulina caput-serpentis* L., *Terebratula (Guynia) capsula* Jeff., *Magellania (Macandrevia) cranium* Müll., *M. septigera* Lovén, *Terebratella spitzbergenensis* Dav., *Megathyris decollata* Chemn., *Cistella cistellula* S. Wood, *Cryptopora gnomon* Jeff., *Rhynchonella (Hemithyris) psittacea* Gmel., *Crania anomala* Müll., and *Discinisca atlantica* King.

Undue stress is often laid on the fact that *Lingula* has come down to us apparently unchanged since Cambrian times, whilst *Crania*, and forms very closely resembling *Discina* and *Rhynchonella*, are found from the Ordovician strata onwards. The former statement is, however, true of animals from other classes at least as highly organized as Brachiopods, e.g., the Gasteropod *Capulus*, whilst most of the invertebrate classes were represented in the Ordovician by forms which do not differ from their existing representatives in any important respect.

A full bibliography of Brachiopoda (recent and fossil) is to be found in Davidson's Monograph of British Fossil Brachiopods, *Pal. Soc. Mon.* vi. 1886. The Monograph on Recent Brachiopoda, by the same author, *Tr. Linn. Soc. London*, Zool. Ser. fi.-iv. 1886-1888, must on no account be omitted. (A. E. S.)

Braddock, a borough of Allegheny county, Pennsylvania, U.S.A., situated in south-western Pennsylvania, on the Monongahela river, 10 miles S.E. of Pittsburgh, at an altitude of 828 feet. It is entered by the Baltimore and Ohio, the Pennsylvania, and the Pittsburg and Lake Erie railways. It is the site of extensive ironworks. Population (1880), 3310; (1890), 8561; (1900), 15,654.

Braddon, Mary Elizabeth (1837—), English novelist, daughter of Henry Braddon, solicitor, of Skirton Lodge, Cornwall, and sister of Sir Edward Braddon, prime minister of Tasmania, was born in Soho, in 1837. She began at an early age to contribute to periodicals, and in 1861 produced her first novel, *The Trail of the Serpent*. In the same year appeared *Garibaldi*, accompanied by *Olivia*, and other poems, chiefly narrative, a volume of extremely spirited verse, deserving more notice than it has received. In 1862 her reputation as a novelist was made by a favourable review in the *Times* of *Lady Audley's Secret*. *Aurora Floyd*, a novel with a strong affinity to *Madame Bovary*, followed, and achieved equal success. Its immediate successors, *Eleanor's Victory*, *John Marchmont's Legacy*, *Henry Dunbar*, remain with her former works the best known of her novels, but all her numerous works have found a large and appreciative public. They give, indeed, the great body of readers of fiction exactly what they require; melodramatic in plot and character, conventional in their views of life, they are yet distinguished by constructive skill and opulence of invention. Her popularity in the British colonies is especially extensive. For a considerable time Miss Braddon conducted *Belgravia*, in which several of her novels appeared. In 1874 she married the late Mr John Maxwell, publisher.

Bradford, a municipal, county, and parliamentary borough and city of the West Riding of Yorkshire, England, on an affluent of the Aire, 9 miles W. by S. of Leeds, 192 miles by rail N.N.W. of London. It has a station on seven railways, and communicates by water with the Mersey

and the Humber. It has adopted almost every public act conducive to its improvement. The old town has been re-modelled. A new central electric light station, just finished, is the completest of its kind. Additional waterworks, tapping the river Nidd 40 miles distant, are in process of construction. There are seven public parks. Recreation grounds, besides, cover 30 acres; and 670 acres of moorland, near the city, have been acquired as an additional recreation ground. Educational establishments include a girls' grammar school (1875), a technical college (1881), acquired by the municipality in 1899, and the United Independent College (1888). Amongst recent institutions are a conditioning-house (1891), for which a new building has been constructed (1900); the post office (1886); the children's hospital (1890); a home for incurables (1893); and a boys' orphanage. The trade of Bradford, according to an official estimate, advanced between 1836 and 1884 from a total of five to at least thirty-five millions sterling, and from not more than five or six to at least fifty leading staple articles. The exports to the United States alone in 1895 amounted to the value of £5,549,000; owing to the McKinley tariffs, the exports in 1899 figure at £1,810,770. This decline is, however, much more than compensated by enhanced trade in the home market. The largest foreign customer for the worsted yarns is Germany, which imports ten times as much as Russia, the next greatest importer. The annual turn-over in the staple trade of Bradford, according to a recent estimate, is not less than £100,000,000. The Saltaire works for alpaca and mohair goods employ about 2500 hands, while silk works at Manningham cover 20 acres and employ 4500 to 5000 people. Furniture-making is a business in rapid growth. In 1891, 13,837 males and 21,670 females were engaged in the worsted; 5040 males and 2954 females in the woollen; 1491 males and 2187 females in the silk; 1135 males and 1096 females in the cotton; and 2380 persons in the iron manufactures. There are three daily newspapers. In 1885 the parliamentary borough was made co-extensive with the municipal and divided into three districts, each of them to return one member to parliament; in 1888 the municipal borough was constituted a county borough, and in 1897 it was created a city; in 1899, whilst the parliamentary borough remained as before, the municipal, county, and city boundaries were extended so as to include the township of IDLE. Area of municipal and county borough and city, before extension, and of present parliamentary borough, 10,791 acres; population (1881), 194,495; (1891), 216,361. Extended area of municipal and county borough and city, 22,720 acres. Population (1891), 265,728; (1901), 279,809.

Bradford, a city of M'Kean county, Pennsylvania, U.S.A., situated in the northern part of the state, at an altitude of 1427 feet. It is in the petroleum region, and its industries consist mainly in the production and refining of mineral oil. It is entered by four railways. Population (1880), 9197; (1890), 10,514; (1900), 15,029.

Bradford-on-Avon, a market town in the Westbury parliamentary division of Wiltshire, England, on the rivers Avon and Kennet, the Avon canal, 6 miles S.E. of Bath, and the Great Western railway. There is still standing a small church, built about 705, and described by Freeman as "the only perfect surviving church of its kind in England, if not in Europe." At the summit of the hill on which the town stands is an ancient chapel, and on one of the central piers of the bridge a small chapel, much modernized, used in ancient times for mass. The parish church—Norman, Early English, and Perpendicular—has been restored, and contains interesting monu-

ments and brasses. There is another Anglican church, and Baptist, Congregational, and Wesleyan chapels. Kingston House, built in the beginning of the 17th century, was long a seat of the dukes of Kingston. There are a town hall, free school (founded 1712), temperance hall, technical institute (containing the county day school), and public baths. Water-works have been constructed. Woollen manufactures, for which Bradford was long famous, have declined, and the principal industries now are the manufacture of india-rubber goods, iron-founding, brewing, and quarrying. Area of urban district, 1962 acres; population (1881), 4922; (1901), 4514.

Bradlaugh, Charles (1833-1891), English politician and freethinker, was born at Hoxton, London, on 26th September 1833. After enlisting as a soldier, he found employment as a lawyer's clerk, and by and by became widely known as a freethought lecturer, under the title of "Iconoclast." He also conducted the *National Reformer* for several years. His Radicalism in religion and politics commended him to the electors of Northampton, by whom he was returned to parliament in 1880. He claimed to be allowed to affirm under the Parliamentary Oaths Act, and the rejection of this pretension, and the refusal to allow Mr Bradlaugh to take the oath on his professing his willingness to do so, involved the House in a series of most unedifying conflicts, terminating in the victory of Mr Bradlaugh, who was permitted to take the oath in 1886. The law was altered two years subsequently. Bradlaugh did not, like so many successful agitators, sink into obscurity upon being deprived of the immediate cause of his notoriety, but gained a very general respect by his transparent honesty and courageous contempt for mere popularity. Experience of public life in the House of Commons seemed to give him a more balanced view of things; and before he died, on 30th January 1891, it was beginning to be said of him that he was in a fair way to grow into something almost akin to a Conservative. Hard, arrogant, and dogmatic, he yet possessed many sterling qualities; his great defect was a lack of imagination.

Bradley, George Granville (1821-—), dean of Westminster, was born 11th December 1821, being the son of the Rev. Charles Bradley, vicar of Glasbury, Brecon. He was educated at Rugby under Dr Arnold, and at University College, Oxford, of which he became a fellow in 1844. He was an assistant master at Rugby from 1846 to 1858, when he succeeded Dr Cotton as headmaster at Marlborough. He occupied this post with great success until December 1870, when he was elected master of his old college at Oxford. In August 1881 he was made dean of Westminster in succession to Dean Stanley, whose pupil and intimate friend he had been. He published his recollections of Dean Stanley, originally delivered in the form of lectures, in 1883; and afterwards took up the biography of Stanley left unfinished by the death of Mr Theodore Walrond, which was ultimately completed by Mr R. E. Prothero. His other publications include *Aids to Latin Prose*, and *Lectures on Job and Ecclesiastes*. One of his daughters, Mrs Margaret Louisa Woods, wife of the ex-president of Trinity College, Oxford, has achieved distinction as a poetess and novelist.

Bradshaw, Henry (1831-1886), librarian of the University of Cambridge, was born on 2nd February 1831, and educated at Eton. He became a fellow of King's College, Cambridge, then a close foundation for Etonians, and was largely instrumental in throwing it open to others. After a short scholastic career in Ireland, and some preliminary work in the Cambridge University Library, he was appointed to this institution as an extra assistant, and soon showed an unexampled faculty for in-

vestigations respecting rare books and curious MSS. In addition to his achievements in black-letter bibliography he threw great light on the life and works of Chaucer, and on ancient Celtic language and literature. Unfortunately he allowed his attention to be too much distracted among a multiplicity of subjects, and the strain upon him was increased by his election in 1867 to the post of university librarian, to which indeed no one else had equal pretensions, but which overwhelmed him with routine duties. He thus left little behind him except a number of brilliant isolated discoveries in bibliography and early literature, besides the fame of having given a marvellous impulse to the former pursuit and impressed it with a more scientific character than had previously belonged to it. As a man he was much respected and beloved. He died very suddenly on 10th February 1886. (R. G.)

Braga, a city and archiepiscopal see of Portugal, in respect of population the third city of the kingdom, capital of the district of Braga, 3 miles S. of the river Cávado. Mount Sameiro is crowned by a colossal monument of the Virgin of the Conception. Population, 28,089. The district of BRAGA, with an area of 1057 sq. miles and population 338,308, giving 320 inhabitants to the sq. mile, is one of the best cultivated regions of Portugal. The principal production is wine, the yield for 1898 having been 7,589,063 gallons, valued at £351,333. Cattle-breeding is an important industry, as also is dairy-farming. The other chief industries are the manufacture of hats, cutlery, linen, and woollens.

Bragança, a city and episcopal see of Portugal, formerly capital of the province of Traz-os-Montes, and now capital of the district of the same name, is situated near the north-east corner of the kingdom. Population, 5840. The district of BRAGANÇA has an area of 2574 sq. miles, and a population of 179,678, giving 70 inhabitants to the sq. mile. Large tracts are uncultivated, and the roads are defective. Silkworms are bred, the annual produce of cocoons amounting to 48,400 lb.

Bragg, Braxton (1817-1876), American soldier, was born in Warren county, North Carolina, on 22nd March 1817. He graduated with high rank at the United States military academy in 1837, and as an artillery officer gained renown during the Mexican war at Fort Brown, Monterey, and Buena Vista. He resigned from the regular army on 3rd January 1856, with the rank of brevet lieutenant-colonel, and retired to his plantation in Louisiana. When in 1861 the Civil War began, he joined the Southern side as brigadier-general, and was sent to command at Pensacola, Florida. In February 1862 he went, as major-general, to the Mississippi army, took part at Shiloh, and was promoted to general on the death of General Albert S. Johnston. In August of that year he led a formidable force into Kentucky, but was checked by Buell, and forced to retreat after the battle of Perryville on 8th October. He was worsted by General Rosecrans in the stubborn contest of Murfreesboro (31st December 1862-2nd January 1863); he defeated Rosecrans at Chickamauga on 19th and 20th September 1863, but was routed by Grant at Chattanooga on 23rd-25th November. Relieved from western command and called to Richmond, he acted there for a time as military adviser to President Davis. In the autumn of 1864 he unsuccessfully led an inferior force from North Carolina to Georgia to oppose Sherman's march. After the war he became chief engineer to the state of Alabama, and supervised improvements in Mobile harbour. He died in Galveston, Texas, on 27th September 1876.

Brahmaputra River, The, rises in 30° 30'

N. lat. and 82° E. long. under the watershed of the Mariam La (15,500 feet), which separates its sources from the eastern affluents of the Mansarowar lake (the sources of the Sutlej), at least 100 miles south-east of those of the Indus. It flows in a south-easterly direction for 170 miles, and then adheres closely to a nearly easterly course for 500 miles more, being at the end of that distance in 29° 10' N. lat. It then bends north-east for 150 miles before finally shaping itself southwards towards the plains of Assam. Roughly speaking, the river may be said so far to run parallel to the main chain of the Himalaya at a distance of 100 miles therefrom. Its early beginnings are cradled amidst a mighty mass of glaciers which entomb the northern slopes of the watershed, separating them from the sources of the Gogra on the south; and there is evidence that two of its great southern tributaries, the Shorta Tsanpo (which joins about 150 miles from its source), and the Nyang Chu (the river of Shigatsi and Gyantsi), are both of them also of glacial origin. From the north it receives five great tributaries, namely, the Chu Nago, the Chachu Tsanpo, and the Charta Tsanpo (all within the first 200 miles of its course), and the Raka Tsanpo and Ky-i-chu (or river of Lhasa) below. The Chachu and the Charta are large clear streams, evidently draining from the great central lake district. Both of them measure more than 100 yards in width at the point of junction, and they are clearly non-glacial. The Raka Tsanpo is a lateral affluent, flowing for 200 miles parallel to the main river course and some 20 to 30 miles north of it, draining the southern slopes of a high snowy range. It is an important feature as affording foothold for the "Janglam" (the great high road of Southern Tibet connecting Ladak with China), which is denied by the actual valley of the Brahmaputra. The great river itself is known in Tibet by many names, being generally called the Nari Chu, Maghang Tsanpo, or Taro Tsanpo, above Lhasa; the word "tsanpo" meaning (according to Waddell) the "pure one," and applying to all great rivers. At 50 miles from its source the river and the Janglam route touch each other, and from that point past Tadam (the first important place on its banks) for another 130 miles, the road follows more or less closely the left bank of the river. Then it diverges northwards into the lateral valley of the Raka, until the Raka joins the Brahmaputra below Janglache. The upper reaches are nowhere fordable between Tadam and Lhasa, but there is a ferry at Likche (opposite Tadam on the southern bank), where wooden boats covered with hide effect the necessary connexion between the two banks and ensure the passage of the Nipal trade. From Janglache (13,800 feet) to Shigatsi the river is navigable, the channel being open and wide and the course straight. This is probably the most elevated system of navigation in the world. From Shigatsi, which stands near the mouth of the Nyang Chu, to the Ky-i-chu, or Lhasa river, there is no direct route, the river being unnavigable below Shigatsi. The "Janglam" takes a circuitous course southwards to Gyantsi and the Tamdok Cho before dropping again over the Kham-bala pass to the ferry at Khamba barje near Chushul. Thence the valley of the Ky-i-chu (itself navigable for small boats for about 30 miles) leads to Lhasa northwards. At Chushul there is an iron chain-and-rope suspension bridge over the deepest part of the river, but it does not completely span the river, and it is too insecure for use. The remains of a similar bridge exist at Janglache; but there are no wooden or twig suspension bridges over the Tsanpo. At Tadam the river is about one half as wide again as the Ganges at Hardwar in December, *i.e.*, about 250 to 300 yards. At Shigatsi it flows in a wide extended bed with many channels, but contracts

again at Chushul, where it is no wider than it is at Janglache, *i.e.*, from 600 to 700 yards. At Chushul (below the Ky-i-chu) the discharge of the river is computed to be about 35,000 cubic feet per second, or seven times that of the Ganges at Hardwar.

For about 250 miles below Ky-i-chu to a point about 20 miles below the great southerly bend (in 94° E. long.) the course of the Brahmaputra has been traced by native surveyors. Then it is lost amidst the jungle-covered hills of the wild Mishmi and Abor tribes to the east of Bhutan for another 100 miles, until it is again found as the Dihong emerging into the plains of Assam. About the intervening reaches of the river very little is known except that it drops through 7000 feet of altitude, and that in one place, at least, there exist some very remarkable falls. These are placed in 29° 40' N. lat., between Kongbu and Pema-Koi. Here the river runs in a narrow precipitous defile along which no path is practicable. The falls can only be approached from below, where a monastery has been erected, the resort of countless pilgrims. Their height is estimated at 70 feet, and by Tibetan report the hills around are enveloped in perpetual mist, and the Sangdong (the "lion's face"), over which the waters rush, is demon-haunted and full of mystic import. From the north-eastern extremity of Assam where, near Sadya, the Lohit, the Dibong, and the Dihong unite to form the wide placid Brahmaputra of the plains—one of the grandest rivers of the world—its south-westerly course to the Bay of Bengal is sufficiently well known. It still retains the proud distinction of being unbridged, and still the River Flotilla Company appoints its steamers at regular intervals to visit all the chief ports on its banks as far as Dibrugarh. Here, however, a new feature has been introduced in the local railway, which extends for some 80 miles to Sadya, with a branch to the Buri Dihing river at the foot of the Patkoi range. The Patkoi border the plains of Upper Assam to the south-east, and across these hills lies the most reasonable probability of railway extension to Burma.

The following are the "lowest level" discharges of the principal affluents of the Brahmaputra in Upper Assam, estimated in cubic feet per second:—

Lohit river, 9 miles above Sadya	38,800
Dibong, 1 mile above junction with Dihong	27,200
Dihong	55,400
Subansiri	16,900

The basins of the Dibong and Subansiri are as yet very imperfectly known. That of the Lohit has been fairly well explored. Near Goalpara the discharge of the river in January 1828 was computed to be 140,000 cubic feet, or nearly double that of the Ganges. The length of the river is 700 miles to the Dihong junction, and about 1000 in Tibet and Eastern Bhutan, above the Dihong. The Brahmaputra, therefore exceeds the Ganges in length by about 400 miles. The bed of the great river maintains a fairly constant position between its extreme banks, but the channels within that bed are so constantly shifting as to require close supervision on the part of the navigation authorities; so much detritus is carried down as to form a perpetually changing series of obstructions to steamer traffic.

An enormous development of agricultural resources has taken place within the Brahmaputra basin of late years, chiefly in the direction of tea cultivation, as well as in the production of jute and silk. Gold is found in the sands of all its upper tributaries, and coal and petroleum are amongst the chief mineral products which have been brought into economic prominence.

See Reports of the native explorers of the Indian Survey, edited by MONTGOMERY and HARMAN. (T. H. H.*).

Brahms, Johannes (1833-1897), German composer, was born in Hamburg on 7th May 1833. He was the son of a double-bass player in the Hamburg city theatre, and received his first musical instruction from his father. After some lessons from a certain O. Cossel, he betook himself to Cossel's master, Eduard Marxsen of Altona, whose experience and artistic taste directed the young man's genius into the highest paths. A couple of public appearances as a pianist were hardly an interruption to the course of his musical studies, and these were continued nearly up to the time when Brahms accepted an engagement as accompanist to a once-famous Hungarian violinist, Remenyi, for a concert-tour in 1853. At Göttingen there occurred a famous *contretemps* which had a most important though indirect influence on the whole after-life of the young player. A piano on which he was to play the "Kreutzer" sonata of Beethoven with Remenyi turned out to be a semitone below the required pitch; and Brahms played the part by heart, transposing it from A to B flat, in such a way that the great violinist, Joachim, who was present and discerned what the feat implied, introduced himself to Brahms, and laid the foundation of a life-long friendship. Joachim gave him introductions to Liszt at Weimar and to Schumann at Düsseldorf; the former hailed him for a time as a member of the advanced party in music, on the strength of his E flat minor scherzo, but the misapprehension was not of long continuance. The introduction to Schumann impelled that master, now drawing near the tragic close of his career, to write the famous article "Neue Bahnen," in which the young Brahms was proclaimed to be the great composer of the future, "he who was to come." The critical insight in Schumann's article is all the more surprising when it is remembered how small was the list of Brahms's works at the time. A string quartet, the first pianoforte sonata, the scherzo already mentioned, and the earliest group of songs, containing the dramatic "Liebestreu," are the works which drew forth the warm commendations of Schumann. In December 1853 Brahms gave a concert at Leipzig, as a result of which the firms of Breitkopf and Haertel and of Senff undertook to publish his compositions. In 1854 he was given the post of choir-director and music-master to the prince of Lippe-Detmold, but resigned it after a few years, going first to Hamburg, and then to Zürich, where he enjoyed the friendship and artistic counsel of Theodor Kirchner. The unfavourable verdict of the Leipzig Gewandhaus audience upon his pianoforte concerto in D minor op. 15, and several remarkably successful appearances in Vienna, where he was appointed director of the Singakademie in 1863, were the most important external events of Brahms's life, but again he gave up the conductorship after a few months

of valuable work, and for about three years had no fixed place of abode. Concert tours with Joachim or Stockhausen were undertaken, and it was not until 1867 that he returned to Vienna, or till 1872 that he chose it definitely as his home, his longest departure from the Austrian capital being between 1874 and 1878, when he lived near Heidelberg. From 1871 to 1874 he conducted the concerts of the "Gesellschaft der Musikfreunde," but after the latter date he occupied no official position of any kind. With the exception of journeys to Italy in the spring, or to Switzerland in the summer, he rarely left Vienna. He refused to come to England to take the honorary degree of Mus.D. offered by the University of Cambridge; the University of Breslau made him Ph.D.

in 1881; in 1886 he was created a knight of the Prussian order *Pour le mérite*, and in 1889 was presented with the freedom of his native city. He died in Vienna on the 3rd of April 1897.

The works of Brahms may be summarized as follows:—Various *sacred compositions for chorus*, op. 12, 13, 22, 27, 29, 30, 37, leading up to op. 45, the "German Requiem" first performed at Bremen in 1868, and subsequently completed by a soprano solo with chorus; the "Triumphlied" in commemoration of the German victories of 1870-71; and some choral songs and motets, op. 74, 109, and 110. *Secular choral works*, op. 17, 41, 42, 44, 50 ("Rinaldo" for tenor solo and male choir), 53 ("Rhapsodie," alto solo and male choir), 54 ("Schicksalslied"), 62, 82 (Schiller's *Nänie*), 89, "Gesang der Parzen" 93, 104, 113. *Concerted vocal works*, op. 20, 28, 31, 52 ("Liebeslieder-Walzer") 61,

JOHANNES BRAHMS.
(From a photograph by C. Brasch, Berlin.)

64, 65 ("Neue Liebeslieder"), 75, 92, 103, 112. *Solo songs*, nearly 300. *Orchestral works*: four symphonies, op. 68, 73, 90, and 98; two serenades, op. 11 and 16; two pianoforte concertos, op. 15 and 83, one violin concerto, op. 77; concerto for violin and violoncello, op. 102; variations on a theme by Haydn, op. 56; two overtures, "Academische Festouvertüre," op. 80, and "Tragic Overture," op. 81. *Chamber music*: two sextets, op. 18 and 36; quintet, piano and strings, op. 34, strings, op. 88 and 111, clarinet and strings, op. 115; three string quartets, op. 51 and 67, three quartets for piano and strings, op. 25, 26, and 60. Three trios for piano and strings, op. 8, 87, and 101; trio for piano, violin, and horn, op. 40; piano, clarinet, and violoncello, op. 114. Duet sonatas, three for piano and violin, op. 78, 100, and 108; two for piano and violoncello, op. 38 and 99; two for piano and clarinet, op. 120. *Pianoforte solos*; three sonatas, op. 1, 2, and 5; scherzo, op. 4; variations, op. 9, 21, 23, 24, 35; 4 ballads, op. 10; waltzes, op. 39; two rhapsodies, op. 79; caprices and intermezzi, op. 76, 116, 117, 118, and 119. 5 *studies* and 51 *Uebungen* without opus-number, and a *chorale-prelude and fugue* for organ, besides

four books of *Hungarian Dances* arranged for piano-forte duet.

Brahms has been often called the last of the great classical masters, in a sense wider than that of his place in the long line of the great composers of Germany. Though only the most superficial observers could deny him the possession of the qualities which distinguish the masters of the romantic school, such as warm imagination, originality of thought and expression, deep emotional tenderness, and the like, it is as a classicist that he must be ranked among modern musicians. From the beginning of his career until its close, his ideas were clothed by preference in the forms which had sufficed for Beethoven, and the instances in which he departed from structural precedent are so rare that they might be disregarded, were they not of such high value that they must be considered as the signs of a logical development of musical form, not as indicating a spirit of rebellion against existing modes of structure. His practice, more frequent in later than in earlier life, of welding together the "working-out" and the "recapitulation" sections of his movements in a closer union than any of his predecessors had attempted, is an innovation which cannot fail to have important results in the future; and if the skill of younger writers is not adequate to such a display of ingenuity as occurs in the finale of the fourth symphony, where the "passacaglia" form has been used with an effect that is almost bewildering to the ordinary listener, that at least stands as a monument of inventiveness finely subordinated to the emotional and intellectual purport of the thoughts expressed. If Brahms's music is not appreciated by every one on a first hearing, this, if it be a defect, is one in which it has been anticipated by the work of every great master since music was a conscious and definite art. His themes are always noble, and even from the point of view of emotional appeal their deep intensity of expression is of a kind which grows upon all who have once been awakened to their beauty, or have been at the pains to grasp the composer's characteristics of utterance. His vocal music, whether for one voice or many, is remarkable for its fidelity to natural inflexion and accentuation of the words, and for its perfect reflexion of the poet's mood. His songs, vocal quartets, and choral works abound in passages that prove him a master of effects of sound; and throughout his chamber music, in his treatment of the piano, of the strings, or of the solo wind instruments he employs, there are numberless examples which sufficiently show the irrelevance of a charge sometimes brought against his music, that it is deficient in a sense of what is called "tone-colour." It is perfectly true that the mere acoustic effect of a passage was of far less importance to him than its inherent beauty, poetic import, or logical fitness in a definite scheme of development; and that often in his orchestral music the casual hearer receives an impression of complexity rather than of clearness, and is apt to imagine that the "thickness" of instrumentation is the result of clumsiness or carelessness. Such instances as the introduction to the finale of the first symphony, the close of the first movement of the second, what may be called the epilogue of the third, or the whole of the variations on a theme of Haydn, are not only marvels of delicate workmanship in regard to structure, but are instinct with the sense of the peculiar beauty and characteristics of each instrument. The "Academic Festival" overture proves Brahms a master of musical humour, in his treatment of the student songs which serve as its themes; and the companion piece, the "Tragic" overture, reaches a height of sublimity which is in no way lessened because no particular tragedy has ever been named in conjunction with the work.

As with all creative artists of supreme rank, the work of Brahms took a considerable time before it was very generally appreciated, but the number of his admirers has been constantly increasing, and nowhere has his music found a warmer welcome than in England. The change in public opinion is strikingly illustrated in regard to the songs, which, once voted ineffective and unvocal, have now taken a place in every eminent singer's repertory. In the other branches of music in which he worked, the structure of the composition is of such enormous importance that its appreciation by the general mass of musical amateurs is of necessity slow. The outline in his greater works must be grasped with some definiteness before the separate ideas can be properly understood in their true relation to each other; and while it is his wonderful power of handling the recognized classical forms, so as to make them seem absolutely new, which stamps him as the greatest musical architect since Beethoven, the necessity for realizing in some degree what musical form signifies has undoubtedly been a bar to the rapid acceptance of his greater works by the uneducated lovers of music. These are of course far more easily moved by effects of colour than by the subtler beauties of organic structure, and Brahms's attitude towards tone-colour was scarcely such as would endear him to the large number of musicians in whose view tone-colour is pre-eminent. His mastery of form, again, has been attacked as formalism by certain superficial critics, blind to the real inspiration and distinction of his ideas, and to their perfection in regard to style and the appropriateness of every theme to the exact emotional state to be expressed. In his larger vocal works there are some which treat of emotional conditions far removed from the usual stock of subjects taken by the average composer; to compare the ideas in the "German Requiem" with those of the "Schicksalslied" or "Nänie" is to learn a lesson in artistic style which can never be forgotten. In the songs, too, it is scarcely too much to say that the whole range of human emotion finds expression in noble lyrics that yield to none in actual musical beauty. The four "Ernstes Gesänge," Brahms's last composition, must be considered as his supreme achievement in dignified utterance of noble thoughts in a style that perfectly fits them. The choice of words for these as well as for the "Requiem" and others of his serious works reveals a strong sense of the vanity and emptiness of human life, but at least as strong a confidence in the divine consolations.

It is the misfortune of the musical world in Germany that every prominent musician is ranged by critics and amateurs in one of two hostile camps, and it is probably due in the main to the misrepresentations of the followers of Wagner that the idea is so generally held that Brahms was a man of narrow sympathies and hard, not to say brutal manners. The latter impression was fostered, no doubt, by the master's natural detestation of the methods by which the average lionizer seeks to gain his object, and both alike are disproved in the *Recollections* of J. V. Widmann, an intimate friend for many years, which throw a new light on the master, revealing him as a man of the widest artistic sympathies, neither intolerant of excellence in a line opposed to his own, nor weakly enthusiastic over mediocre productions by composers whose views were in complete sympathy with him. His admiration for Verdi and Wagner is enough to show that the absence of any operatic work from his list of compositions was simply due to the difficulty of finding a libretto which appealed to him, not to any antagonism to the lyric stage in its modern developments. How far he stood from the prejudices of the typical pedant may be seen in the passionate love he showed throughout his life for national

music, especially that of Hungary. Not only were his arrangements of Hungarian dances the first work by which his name was known outside his native land, but his first pianoforte quartet, op. 25 in G minor, incurred the wrath of the critics of the time by its introduction of some characteristics of Hungarian music into the finale. His arrangement of a number of children's traditional songs was published without his name, and dedicated to the children of Robert and Clara Schumann in the earliest years of his creative life; and among the last of his publications was a collection of forty-nine German Volkslieder, arranged with the utmost skill, taste, and simplicity. His well-known admiration for the waltzes of Strauss is referred to in all the biographies, and in many passages of his works the *entrain* that is characteristic of the Viennese dance-writers is present in a striking degree. Within so short a time of the completion of his work, it is impossible to determine the exact place in the hierarchy of music which Brahms will ultimately fill; but the more closely his music is studied, the more strongly will the conviction grow that the last in the illustrious line of German composers is to be ranked with the greatest of all.

(J. A. F. M.)

Braidwood, a city of Will county, Illinois, U.S.A., situated in the eastern part of the state, 58 miles S. of Chicago, on the Chicago and Alton railway. Its principal industry is the mining of coal. Population (1880), 5524; (1890), 4641; (1900), 3279.

Braila, a town in Rumania, on the left bank of the Danube, about 10 miles S. of Galatz, 100 miles from Sulina on the Black Sea, and 145 miles from Bucarest. As the grain trade of the Danube has been gradually usurped by Braila, so has the town grown and been improved. The main streets are paved, and there is a regular supply of filtered water. Large docks and dependencies identical to those at Galatz have been constructed, and extensive quays face the river bank. Braila is essentially commercial, and has an exchange and chamber of commerce; the Bank of Rumania is represented by a branch office. An electric tramway has been laid down, and, besides the lines running in the town, conveys passengers to Lacul Sarat (Salt Lake), whose iodine waters are held in much repute. Population (1900), 58,392, of whom 10,811 are Jews.

The total imports in 1898 were 137,169 tons, value £1,812,490; total exports, 621,906 tons, value £2,624,258. Of these the principal articles of import were:—Cotton yarn, £178,932; machinery, £161,440; jute cloth, £103,719; coal, £75,084; textiles, £115,000; heavy ironmongery, £71,422; sheet-iron, £70,344. The principal articles of export were:—Maize, £769,646; barley and malt, £445,936; wheat, £397,745; dried vegetables, £273,295; flour, £178,144; oleaginous seeds, £160,230; oats, £153,483; rye, £123,144; millet, £41,028. Braila was visited in 1880 by 172 vessels of 194,919 tons; in 1890 by 474 vessels of 516,065 tons; and in 1899 by 121 vessels of 165,842 tons.

Many events connected with the history of Wallachia took place in the neighbourhood of this city. In 1475 Stephen the Great, having dethroned the Voivode Radu, burned the town. In 1573 another Moldavian prince took the city by storm, and massacred the Turkish garrison. In the year 1659 it was again burned by the Wallachian prince Mircea, and for the time the Turks were expelled, but afterwards returned and possessed it almost without interruption from 1544 to 1828. In the latter year the Russians captured it after a long and sanguinary siege, when the Turks displayed courage and military virtue almost as extraordinary as they showed half a century later at the siege of Pleyna. By the treaty of Adrianople, however, it was stipulated that the Wallachian fortresses on the Danube should be restored to the principality. Before carrying out this stipulation, the Grand Duke Michael razed the citadel of Braila, and in this ruinous condition it was handed over to the Wallachians. On the banks of Danube, a little above the city, are observable some remains of the piles of a bridge said to have been built by Darius.

Braine l'Alleud (Flemish, *Eigen-Brakel*), a town

of Belgium, in the province of Brabant, 12 miles S. of Brussels by rail. Its industries are numerous, and include the manufacture of woollen and cotton fabrics, dye-works, tan-yards, and breweries. In the district are the Waterloo Lion and Hougomont. Population (communal) (1880), 6370; (1897), 7885.

Brainerd, capital of Crow Wing county, Minnesota, U.S.A., situated in the central part of the state, on Mississippi river, at the junction of two branches of the Northern Pacific railway, at an altitude of 1209 feet. Population (1880), 1865; (1890), 5703; (1900), 7524.

Brakes.—(1) **HYDRAULIC MILITARY.**—The hydraulic principle is almost universally adopted in brakes for controlling the recoil of guns. As the recoil energy may be very high, while for the purpose of facilitating the working of the gun and keeping a high rate of fire the length of recoil is kept short, the strains on the structures carrying the gun are severe, and it is necessary to equalize the strain through the recoil stroke to keep the stresses to a minimum.

The hydraulic brake, or pump brake, used for this purpose consists of a cylinder with piston and piston rod, the liquid being forced at high velocity through an orifice formed in the piston head. This arrangement is illustrated in the figure. The piston rod, *a*, of the hydraulic brake is firmly attached to the gun, *b*, by the lug, *c*, and on recoil of the gun in the direction of the arrow, the liquid in the space, *d*, is forced at constant velocity

through the orifice, *f*. The area of this orifice is regulated by the valve key, *g*, which is so shaped longitudinally that the orifice contracts as the recoil velocity falls off, and the resistance is in consequence approximately uniform throughout the stroke. When recoil ceases the gun is returned to firing position by the spring, *k*. The velocity of movement of the gun during recoil is not uniform, but varies from a maximum, shortly after recoil commences, to rest at the end of the stroke. As it is necessary, to obtain uniform resistance, that the velocity of flow should be preserved constant, a valve key to the cylinder is generally employed to produce the desired result by automatically closing the orifice as the speed falls off during recoil.

(2) **ELECTRIC.**—The adoption of electricity for the purpose of operating cranes or lifts has led to the introduction of electrically-controlled frictional brakes. In the case of cranes for lifting weights, the object sought is to prevent the load from taking charge and lowering itself when the current is cut off from the motor; and the arrangement adopted usually consists of a frictional brake, normally applied by spring pressure, but held off by an electro-magnet actuated by the electric current for the motor, or by a shunt current, when the motor is in action.

On electric elevators or lifts a somewhat similar arrangement is adopted. The brake is usually a strap passing round a drum carried on the motor shaft; the strap is fixed at one end and applied by a spring at the other, which is connected also to the armature of a compound wound electro-magnet, which working against the spring releases the brake when the current passes. One winding of the magnet is in series with the motor, releasing the brake when the current is actuating the motor in hoisting, and the other is a shunt winding used for descending, and controlled by a centrifugal governor on the motor, which automatically cuts out the shunt circuit if the speed of descent becomes too great. An electric brake to control the speed of the cage when lowering is obtained also by use of the driving motor as a dynamo generating electricity, which is passed through an electrical resistance. In this case the weight of the cage is utilized to back-drive and rotate the motor connected up as a dynamo, the power absorbed by the motor in generating its

current furnishing the brake resistance. The current generated varies in potential from zero to a maximum, and the speed of fall of the cage is regulated by varying the electrical resistance. Electric lifts similarly operated are used also on warships for supply of ammunition to the guns.

(G. H. BA.)

(3) RAILWAY.—From the very beginning of steam railways, hand-brakes of various forms have been employed, and they are still largely used on goods trucks. Each hand-brake is independent of all others, and the time required to bring a number of them into operation depends upon the activity of the brakemen. The necessity for prompt and effective application of brakes in an emergency led to the invention of means to operate them with power superior to muscular force. Such brakes are known as power brakes. These may be divided into four classes:—(1) Mechanical brakes, worked by springs, by friction wheels on the axle, by chains wound on drums, and other mechanical devices, or by the force produced when, by reason of a sudden checking of the speed of the locomotive, the momentum of the cars causes pressure on draw-bars or buffing devices. All such momentum or buffer brakes were proved radically defective by tests made by a committee of the Master Car Builders' Association of the United States at Burlington, Iowa, in 1886. (2) Hydraulic brakes, worked by means of water forced through pipes into proper mechanism for transmitting its force to the brake-shoes. (3) Electric brakes, worked by magnets acting on discs or similar appliances fastened to the wheels or axles; or, more recently, by magnets using the rail as a keeper and utilizing the drag thus produced to force ordinary brake-shoes against the wheels. (4) Air- and vacuum-brakes, worked by compressed air, or by air at atmospheric pressure operating on a vacuum. To these might be added brakes worked by steam or water from the boiler of the engine, operating by means of a cylinder, the use of which is generally limited to the locomotive. Prominent among these is the Le Chatelier or water-brake so called, in which a pipe is led from the boiler below the water line to the locomotive cylinder exhaust ports, the cylinders acting as compressors. The arrangement also prevents hot gases and cinders from being drawn into the cylinders from the smoke-box.

Power brakes may be either continuous or independent—continuous if connected throughout the train and with the locomotive by pipes, wires, &c., as the compressed air, vacuum and electric brakes; independent if not so connected, as the buffer-brakes and hand-brakes. Continuous brakes may be divided into two other great classes—automatic and non-automatic. The former are so arranged that they are applied automatically on all the coaches of the train if any important part of the apparatus is broken, or the couplings between cars are ruptured; in an emergency they can be put on by the guard, or (in some cases) by a passenger. Non-automatic brakes can be applied only by the person (usually the engine-driver) to whom the management of them is given. They may become inoperative on all the coaches, and always on those which have become detached, if a coupling or other important and generally essential part is broken. Many mechanical and several hydraulic and electrical continuous brakes have been invented and tried. Experience has shown them so inadequate in practice that they have all practically disappeared, leaving the field to the air- and the vacuum-brakes. At first these were non-automatic, but in 1872 the automatic air-brake was invented by Mr George Westinghouse, the many advantages of which over the non-automatic brake quickly led to its wide adoption. An automatic vacuum-brake, invented a few years later, is used largely in the United Kingdom and the British colonies.

The Westinghouse non-automatic air-brake consists in its simplest form of a direct-acting, steam-driven air-pump, carried on the locomotive, which forces compressed air into a reservoir, usually placed under the foot-plate of the locomotive. From the reservoir a pipe is led through the engine cab, where it is fitted with a three-way cock, to the rear of the locomotive tender, where it terminates in a flexible hose, on the end of which is a coupling. The coaches are furnished with a similar pipe, having hose and coupling at each end, which is connected to one end of a cylinder containing a piston, to the rod of which the brake-rods and levers are connected. The application of the brakes is effected by the engine-driver turning the three-way cock, so that compressed air flows through the pipe and acting against one side of the brake-cylinder piston, applies the brake-shoes to the wheels by the movement of this piston and the rods and levers connected to it. To release the brakes the three-way cock is turned to cut off communication between the main reservoir and the train-pipe, and to open a port permitting the escape of the compressed air in the train-pipe and brake-cylinders. This brake was soon found defective and inadequate in many ways. An appreciable time was required for the air to flow through the pipes from the locomotive to the car-cylinders, and this time increased quickly with the length of the trains. Still more serious, however, was the fact that on detached coaches the air-brakes could not be applied, the result being sometimes serious collisions between the front and rear portions of the train. Those respects in which the non-automatic brake is inadequate will be understood from the following summary of the requirements most important in a train-braking apparatus. (1) It must be capable of application to every wheel throughout the train. (2) It must be so prompt in action that the shortest possible time shall elapse between its first application and the moment when the full power can be exerted throughout the train. (3) It must be capable of being applied by the engine-driver or by any of the officials in charge of the train, either in concert or independently. (4) The motion of the train must be arrested in the shortest possible distance. (5) The failure of a vital part must declare itself by causing the brake to be applied and to remain applied until the cause of failure is removed. (6) The breaking of the train in two or more parts must cause immediate automatic application of the brakes on all the coaches. (7) When used in ordinary service stops it must be capable of gradual and uniform application (followed, if necessary, by a full emergency application at any part of the service application) and of prompt release under all conditions of application. (8) It must be simple in operation and construction, not liable to derangement, and inexpensive in maintenance.

In the automatic vacuum-brake, the exhausting apparatus generally consists of a combined large and small ejector, worked by steam and under the control of the driver, though in some forms of the vacuum-brake, such as are used on the Great Western and London and North-Western railways, an air-pump, driven from the main axle of the locomotive, is substituted for the small ejector. These ejectors, of which the small one is at work continuously while the large one is only employed when it is necessary to create vacuum quickly, e.g., to take off the brakes after a short stop, produce a vacuum of 18 or 20 inches in the train-pipe, which extends the whole length of the train and communicates under each vehicle with a cylinder, to the piston of which, by suitable rods and levers, the brake-shoes are connected. The communication between the train-pipe and the cylinder is controlled by a ball-valve, which consists merely of a

*Simple
air-brake.*

*Automatic
vacuum-
brake.*

half-inch brass ball, having a rolling action in a horizontal direction (see Figs. 1 and 2). The spindle with the release

FIG. 1.—Automatic Vacuum-Brake. (The dots indicate atmospheric pressure.)

valve is added for the purpose of withdrawing the ball from its seat when it is necessary to take off the brakes by hand; it is made air-tight by a small diaphragm, the

pressure on which, when there is vacuum in the pipe, pulls in the spindle and allows the ball to fall freely into its seat. When air is exhausted through the train-pipe it travels out from the top of the cylinder direct, and from the bottom past the ball, which is thus forced up the incline of the spindle, to roll back again to its seating when the exhaustion is complete. In this state of affairs the piston is held in equilibrium and the brake-blocks are free of the wheels. To apply them, air is admitted to the train-pipe, either purposely by the guard or driver, or accidentally by the rupture of the train-pipe or coupling hose between the vehicles. The air passes to the lower side of the piston, but is prevented from gaining access to the upper side by the ball valve which blocks the passage; hence the pressure becomes different on the two sides of the piston, which in consequence is forced upwards and thus applies the brakes (see Fig. 1). They are released by the re-establishment of equilibrium (by the use of the large ejector if necessary); when this is done the piston falls and the brakes drop off. The general arrangement of the apparatus is shown in Fig. 2. To render the application of the brakes nearly simultaneous throughout a long train, the valve in the guard's van is arranged to open automatically when the driver suddenly lets in air to the train-pipe. This valve has a small hole through its stem and is secured at the top by a diaphragm to a small dome-like chamber, which is exhausted when a vacuum is created in the train-pipe. A gradual application destroys the vacuum in the chamber as quickly as in the pipe, but

FIG. 2.—Automatic Vacuum-Brake, showing its general arrangement.

with a sudden one the vacuum below the valve is destroyed more quickly, and so the pressure of the atmosphere on the diaphragm lifts the valve and admits air.

In the Westinghouse automatic quick-action air-brake a main air reservoir on the engine is kept charged with compressed air at 90 lb per square inch by means of

the pump, controlled by an automatic governor. Conveniently placed on the locomotive is a valve called the driver's valve, which is connected by a pipe with the main reservoir; by means of this the driver controls the flow of air from the main reservoir to the train-pipe, or from the train-pipe to the

**Automatic
air-brake.**

atmosphere. Attached to it is a reducing valve, which, in the normal or running position of the former, reduces the pressure of the air flowing from the main reservoir to the train-pipe to 70 lb per square inch, or 20 lb per square inch less than the pressure in the main reservoir. A train-pipe runs the whole length of the train. In addition to the brake-cylinder each vehicle is supplied with an air reservoir, called the auxiliary reservoir, and an automatic valve called a triple valve. The auxiliary reservoir receives air from the train-pipe and stores it for use in the brake-cylinder of its own vehicle, and both the auxiliary reservoir and triple valve are connected directly or indirectly with the train-pipe. The general arrange-

ment of the brake apparatus on a passenger coach is shown in Fig. 3. The brake-cylinder is in section disclosing the piston and release spring. The automatic action of the brake is due to the construction of the triple valve, the principal parts of which are a piston and slide valve so arranged that the air in the auxiliary reservoir acts at all times on the side of the piston to which the slide valve is attached, while the air in the train-pipe exerts its pressure on the opposite side. A moderate reduction of air pressure in the train-pipe causes the greater pressure remaining stored in the auxiliary reservoir to force the piston of the triple valve with its slide valve to a position which will allow the air in the auxiliary reservoir to pass directly into the brake-cylinder and apply the brake. A sudden or violent reduction of the air in the train-pipe produces the same effect, and in addition causes supplemental valves in the triple valve to be opened, permitting the pressure in the train-pipe also to enter the brake-cylinder, augmenting the pressure derived from the auxiliary

FIG. 3.—Diagram of the principal parts of an Air-Brake on one car.

ment of the brake apparatus on a passenger coach is shown in Fig. 3. The brake-cylinder is in section disclosing the piston and release spring.

The automatic action of the brake is due to the construction of the triple valve, the principal parts of which are a piston and slide valve so arranged that the air in the auxiliary reservoir acts at all times on the side of the piston to which the slide valve is attached, while the air in the train-pipe exerts its pressure on the opposite side. A moderate reduction of air pressure in the train-pipe causes the greater pressure remaining stored in the auxiliary reservoir to force the piston of the triple valve with its slide valve to a position which will allow the air in the auxiliary reservoir to pass directly into the brake-cylinder and apply the brake. A sudden or violent reduction of the air in the train-pipe produces the same effect, and in addition causes supplemental valves in the triple valve to be opened, permitting the pressure in the train-pipe also to enter the brake-cylinder, augmenting the pressure derived from the auxiliary

reservoir about 20 per cent. This causes practically instantaneous action of the brakes to their highest efficiency throughout the entire train. The same effect is produced should the train break in two or a hose or any part of the train-pipe burst. Sometimes the passengers are provided with the means of thus arresting the train on an emergency, a cord running along the inside or outside of the coaches, which on being pulled opens a valve connected to the train-pipe; this arrangement is applicable both to the vacuum and compressed-air brakes. When the pressure in the brake-pipe is again restored to an amount in excess of that remaining in the auxiliary reservoir, the piston and slide valve are forced in the opposite direction to their normal position, communication is opened from the train-pipe to the auxiliary reservoir, and the air in the brake-cylinder escapes to the atmosphere, thus releasing the brakes.

The quick-action triple valve is shown in section in Fig. 4. It consists essentially of two mechanisms: first, a piston and slide valve, 5 and 3, which, properly arranged, constitute the automatic feature; and second, the piston, 8, puppet valve, 10, and check valve, 15, by means of which quick action is obtained. The latter feature is only essential when stops are to be made in the shortest distance possible, and therefore this part of the mechanism does not come into action during ordinary or "service" stops. The train-pipe is connected at 18, admitting compressed air to chamber 13, thence to chamber 19, underneath piston 5, which is forced to the position shown in the diagram, there admitting air through feed ports *i* and *k*, above the slide valve 3 to the auxiliary reservoir at *B*, in which pressure soon equals that in the train-pipe and the flow stops. In this position port *G*, which communicates with a conduit leading to the brake-cylinder, is in communication with the atmosphere through ports *N* and *P* and the brakes are released. If a slight or gradual reduction of pressure is made in the train-pipe, piston 5 moves to the left until it is arrested by graduating stem 21. Its first movement opens graduating valve 7 to port *z*. When in the position against graduating stem 21 communication between ports *G* and *P* is cut off, and port *z* is open to *G*, causing a flow of air from the auxiliary reservoir to the brake-cylinder, which continues until the pressure on the reservoir side of piston 5 is slightly less than that on the train-pipe side, when the piston 5 is moved far enough to the right to close port *z*, by graduating valve 7. The resistance of the slide valve 3 is too great to be overcome by this slight difference in pressure, so its position is unchanged and the brakes are held applied. A further reduction in the train-pipe pressure will admit more air through port *z*, by moving the piston again to the left, increasing the force of the application, which, if allowed to continue, will cause an equalization of pressure between the auxiliary reservoir and the brake-cylinder when the brakes are fully applied. To release, the full pressure in the train-pipe and consequently underneath piston 5 is restored, which restores all parts to position shown in the diagram, permitting the air in the brake-cylinder to escape to the atmosphere through ports *r*, *N*, and *P*. When the shortest stop is desired, a quick and considerable reduction in pressure is made in the train-pipe. The result is that the piston 5 moves its full traverse, compresses spring 22, bringing port *s* in register with port *r*, and allowing the auxiliary

reservoir air to flow into the brake-cylinder. At the same time air admitted through port *t* moves piston 8, which unseats valve 10, and allows train-pipe air to lift check valve 15 and charge the brake-cylinder with air from the train-pipe, in addition to that from the auxiliary reservoir. In this way not only is a very sudden application of the brakes brought about, but also an increased force of application of about 20 per cent. over the greatest force of an ordinary application. This sudden venting of the train-pipe into each brake-cylinder gives an extremely rapid serial action of the brakes on a train of vehicles by means of which the various brakes throughout the train are successively applied almost with the rapidity of sound.

It is well known that brake-shoes can be applied,

FIG. 4.—Air-Brake Triple Valve.

without skidding the wheels, with greater pressure at high speeds than at low. Advantage is taken of this fact in the design of the high-speed brake, invented in 1894, which consists of attachments, by means of which the pressure in the train-pipe and reservoirs can be increased at the will of the driver. The increased pressure acting in the brake-cylinder increases in the same proportion the pressure of the brake-shoes against the wheels. Attached to the brake-cylinder is a valve for automatically reducing the pressure therein proportionately to the reduction in speed, until the maximum pressure under which the brakes are operated in making ordinary stops is reached, when this valve closes, and the maximum safe pressure for operating the brakes at ordinary speeds is retained until a stop is made.

Famous tests of railway brakes were those made by the late Sir Douglas Galton, K.C.B. (then Capt. Galton, R.E.), and Mr Westinghouse on the London, Brighton, and South Coast railway, in England, in 1878, and by a committee of the Master Car Builders' Association, near Burlington, Iowa, in 1886 and 1887.

The object of the former series was to determine the co-efficient of friction between the brake-shoe and the wheel, and between the wheel and rail at different velocities when the wheels were revolving and when skidded, *i.e.*, stopped in their rotation and caused to slide. These experiments were the first of their kind ever undertaken, and for many years their results furnished most of the trustworthy data obtainable on the friction of motion. It was found that the co-efficient of friction between cast-iron shoes and steel-tired wheels increased as the speed of the train decreased, varying from 0.111 at 55 miles an hour to 0.33 just moving. It also decreased with the time during which the brakes were applied; thus at 20 miles an hour the co-efficient was at the beginning 0.182, after ten seconds 0.133, after twenty seconds 0.099. Generally speaking, especially at moderate speeds, the decrease in the co-efficient of friction due to time is less than the increase due to decrease of speed, although when the time is long the reverse may be true. When the wheels are skidded the retardation of the train is always reduced; therefore, for the greatest braking effect, the pressures on the brake-shoes should never be sufficient to cause the wheels to slide on the rails. The Burlington brake tests were undertaken to determine the practicability of using power brakes on long and heavy freight trains. In the 1886 tests there were five competitors—three buffer-brakes, one compressed-air-brake, and one vacuum-brake. The tests comprised stops with trains of twenty-five and fifty vehicles, at 20 and 40 miles an hour, on the level and on gradients of 1 in 100. They demonstrated that the buffer-brakes were inadequate for long trains, and that considerable improvements in the continuous brakes, both compressed-air and vacuum, would be needed to make them act quickly enough to avoid excessive shocks in the rear vehicles. In 1887 the trials of the year before were repeated by the same committee, and at the same place. Trains of fifty vehicles fitted with each brake were again provided, and there were again five competitors, but they all entered continuous brakes—three compressed-air-brakes, one vacuum, and one electric. The results of the first day's test of the train equipped with Westinghouse brakes are shown in Table I., the distances in which are the feet run by the train after the brakes were set, and the times the seconds that elapsed from the application of the brakes to full stop.

TABLE I.—Stops of a Train of Fifty Empty Cars, 1887—Automatic Air-Brakes.

Speed in Miles per Hour.	Distance in Feet.	Time in Seconds.	Equivalent Distance at 20 Miles and 40 Miles.	
19½	186	9½	196	...
19¼	215	11	233	...
36½	588	17	...	693

The remarkable shortness of these stops is the more evident when they are compared with the best results obtained in 1886, as shown in Table II.

TABLE II.—*Stops of a Train of Fifty Empty Cars, 1886—Automatic Air-Brakes.*

Speed in Miles.	Distance in Feet.	Time in Seconds.	Equivalent Distance at 20 Miles and 40 Miles.	
23·5	424	17½	307	...
20·3	354	16	340	...
40	922	22½	...	922
40	927	22¼	...	927

The time that elapsed between the application of the brakes on the engine and on the fiftieth vehicle was almost twice as great in 1886 as in 1887, being in the latter tests only five to six seconds, and in 1887 the stops were made in less than two-thirds the distance required in 1886. Still, violent shocks were caused by the rear vehicles running against those in front, before the brakes on the former were applied with sufficient force to hold them, and these shocks were so severe as to make the use of the brakes in practice impossible on long trains. When the triple valves were actuated electrically, however, the stops were still further improved, as shown in Table III.

TABLE III.—*Stops of a Train of Fifty Empty Cars—Electric Application of Air-Brakes.*

Speed in Miles.	Distance in Feet.	Time in Seconds.	Equivalent Distance at 20 Miles and 40 Miles.	
21½	160	7	139	...
23	183	8	138	...
38	475	14½	...	519
36½	460	14	...	545

Although the same levers, shoes, rods and other connexions were used, there were no shocks in the fiftieth car of the train on any stop, whether on the level or on a gradient. The committee in charge reported that the best type of brake for long freight trains was one operated by air, in which the valves were actuated by electricity, but they expressed doubt of the practicability of using electricity on freight trains. The Westinghouse Company then proceeded to quicken the action of the triple valve, operated by air only, so that stops with fifty-car trains could be made without shock, and without electrically operated valves; and they were so successful in this respect that, towards the end of the same year, 1887, with a train of fifty vehicles, stops were made without shock, fully equalling in quickness and shortness of distance run any that had been made at the trials by the electrically operated brakes.

In 1889 some further tests were made by Sir Douglas Galton with the automatic vacuum-brake, on a practically level portion of the Manchester, Sheffield, and Lincolnshire railway (now the Great Central). The train was composed of an engine, tender, and forty carriages, the total length over buffers being 1464 feet, and the total weight 574 tons, of which 423 tons were braked. At a speed of about 32 miles an hour this train was brought to a standstill in twelve seconds after the application of the brakes, in a distance of 342 feet.

(E. M. HE.; H. M. R.)

Brambanan (better PRAMBANAN), a village in Java, south of the Merapi (Mir-Api), in the territory of the sultan of Surakarta, near the frontier of Djokakarta (Djogjakarta). Among the most remarkable of the Hindu temples (Tjandis or Chandis) are Kalasa or Kali-bening, a twelve-sided pyramid, 70 feet high, and near it Sari, a quadrilateral building, Chandi China, and Lará Jorgran, the last the temple, *par excellence*, of Prambanan, comprising a group of eleven, of which two are of large size.

For recent descriptions (since 1875) of the monuments, the inscriptions, and the history of Hinduism, as connected with these ruins, see TIJDSCHRIFT VOOR IND. *Taal-Land en Volkskunde*, xxxi. and xxxii. Batavia, 1886 and 1887.—YZERMAN. *Beschrijving der ondheden naby de greus der residenties Soerakarta a Djogjakarta*. Batavia, 1891. Brampton, a market town and railway station in the Eskdale parliamentary division of Cumberland, England, 9 miles E.N.E. of Carlisle. Of the ancient parish church only the interesting chancel is left, but there are a modern parish church, a Presbyterian church (1662), and Methodist chapel; also a moot hall, and two other halls. Roman remains are frequently found in the neighbourhood. There are cattle and sheep markets. Area of civil parish, 6466 acres; population (1881), 3438; (1901), 2494.

Brampton, a township in the Chesterfield parliamentary division of Derbyshire, England, 3 miles W. by N. of Chesterfield. A parish church contains ancient memorials, and has been restored. The industries of the parish are agriculture and quarrying. Area, 8156 acres; population (1881), 6383; (1901), 2185. In 1892 the borough of Chesterfield was enlarged so as to include a portion of this parish. The urban district of Brampton and Walton has an area of 10,102 acres; population (1891), 2532; (1901), 2698.

Brampton, Henry Hawkins, 1st BARON (1817—), English judge, was born at Hitchin, on 14th September 1817. He received his education at Bedford school. The son of a solicitor, he was early familiarized with legal principles, a training which stood him in good stead throughout his long forensic career. Called to the bar by the Middle Temple in 1843, he at once joined the old home circuit, and after enjoying a lucrative practice as a junior, took silk in 1858. His name is identified with many of the famous trials of the reign of Queen Victoria. He was successfully engaged as junior to Mr Edwin James in the Simon Bernard case (of the Orsini plot celebrity), as junior to Mr (afterwards Lord Chief Justice) Bovill in that of *Roupell v. Waite*, and appeared together with Sir John Karslake (Solicitor-General), Mr Hardinge Giffard (afterwards Earl Halsbury), and Serjeants Ballantyne and Parry on behalf of the several defendants in the Overend-Gurney prosecutions, which resulted in the acquittal of the accused. The two *causes célèbres*, however, in which Lord Brampton attained his highest legal distinction, were the Tichborne trials and the great will case of *Sugden v. Lord St Leonards*. In both of these he was victorious. In the first his masterly cross-examination of the witness Baigent was one of the great features of the trial. He did a lucrative business in references and arbitrations, and acted for the royal commissioners in the purchase of the site for the new law courts. Election petitions also formed another branch of his extensive practice. Mr Hawkins was raised to the bench in 1876, and was assigned to the then Exchequer division of the High Court, not as baron (an appellation which was being abolished by the Judicature Act), but with the title of Sir Henry Hawkins. He was a great advocate rather than a great lawyer. His searching voice, his manner, and the variety of his facial expression, gave him an enormous influence with juries, and as a cross-examiner he was seldom, if ever, surpassed. He was an excellent judge in chambers, where he displayed a clear and vigorous grasp of details and questions of fact. His knowledge of the criminal law was extensive and intimate, the reputation

he gained as a "hanging" judge making him a terror to evil-doers; and the Court for Crown Cases Reserved was never considered complete without his assistance. In 1898 he retired from the bench, and was raised to the peerage under the title of Baron Brampton. He has frequently taken part in determining House of Lords appeals, and his judgments have been distinguished by their lucidity and grasp. He held for many years the office of counsel to the Jockey Club, and as an active member of that body found relaxation from his legal and judicial duties at the leading race meetings, and has been considered a capable judge of horses. In 1898 he was received into the Roman Catholic Church.

Bramwell, George William Wilshere, BARON (1808-1892), English judge, was born in London on 12th June 1808, being the eldest son of George Bramwell, of the banking firm of Dorrien, Magens, Dorrien and Mello, 22 Finch Lane, E.C. (died 1851). He was educated privately, first at Dr. Reddy's school at Camberwell, where W. F. Channell (afterwards, like himself, a Baron of the Exchequer) was one of his school-fellows, and later he went to Palace school, Enfield, kept by Dr May. At the age of sixteen he entered Dorriens' bank, where he gained a practical knowledge of commercial and particularly of banking matters of great use to him in his legal career. In 1830 he gave up business for the law, becoming a pupil in the chambers of Fitzroy Kelly, then a barrister of six years' standing, and afterwards successively Solicitor-General, Attorney-General, and, ten years after Bramwell himself had been raised to the bench, chief baron of the Exchequer. At first Bramwell was content to take out the certificate of a special pleader, and practised as such for some years at 3 Serjeants' Inn. The work of special pleaders (now obsolete) was confined to drawing the pleadings (preliminary documents which precede a trial), which in those days had to be drawn subject to rigid rules, so as to state with the strictest accuracy the issues to be raised at the hearing of the cause. Bramwell had been admitted as a student at Lincoln's Inn in 1830, and at the Inner Temple in 1836, and he was eventually called to the bar at both Inns in 1838. He soon worked his way into a good practice both in London and the home circuit, his knowledge of law and procedure being so well recognized that in 1850 he was appointed a member of the Common Law Procedure Commission, which resulted in the Common Law Procedure Act of 1852. This Act he drafted jointly with his friend Mr (afterwards Mr Justice) Willes, and thus began the abolition of the system of special pleading. In 1851 Lord Cranworth made Bramwell a Queen's counsel, and the Inner Temple elected him a benchman,—he had ceased to be a member of Lincoln's Inn in 1841. In 1853 he served on the Royal Commission to inquire into the assimilation of the mercantile laws of Scotland and England and the law of partnership, which had as its result the Companies Act of 1862. It was he who, during the sitting of this Commission, suggested the addition of the word "limited" to the title of companies that sought to limit their liability, in order to prevent the obvious danger to persons trading with them in ignorance of their limitation of liability. This danger had apparently seemed insuperable to some members of the Commission, and its removal by a single word affords a typical instance of Bramwell's hard-headed business-like common sense. As a Queen's counsel Bramwell enjoyed a large and steadily increasing practice. Of his methods at the bar and his attitude towards the law, it has been said that where other distinguished lawyers of his day would read a client's story in a brief, and then turn at once to find a case "on all fours" with it, Bramwell's way was, after mastering the

facts, to make up his mind as to what principles were involved, and what the law must be in order that justice might be done, and then seek for authority in support of his view. It is interesting to note the steady progress of Bramwell in his profession as shown by his fee-book, and also to compare the income of an English barrister with a good commercial practice in the 'forties and 'fifties, with those of men in similar circumstances in other generations. Mr Bramwell made, in the sixth year after his call £850, in the seventh year £1187, in the eighth £1533—a friend betting him in the last-named year that in three years he would confess to having passed all the other juniors on his circuit. In the first year after he "took silk" he made £3414, in the three following years, £4549, £5846, and £7107 respectively. In his last year at the bar he nearly reached £8000, a large sum in those days for his class of practice; but he had no opportunity of raising his income higher, as in 1866 Baron Parke (afterwards Lord Wensleydale) resigned his seat in the Court of the Exchequer after occupying it for twenty-two years, and Lord Cranworth invited Mr Bramwell, Q.C., to fill his place.

As a baron of the Exchequer he sat for twenty years, earning a high reputation in the trial both of civil causes and of criminal charges, although his previous personal experience of crime was said to be limited to a single brief in a criminal case. In 1867, with Mr Justice Blackburn and Sir John Coleridge, he was made a member of the Judicature Commission. In 1871 he was one of the three judges who refused the seat on the Judicial Committee of the Privy Council to which Sir Robert Collier, in evasion of the spirit of the Act creating the appointment, was appointed; and in 1876 he was raised to the Court of Appeal, where he sat till the autumn of 1881. As a puisne judge he had been conspicuous as a sound lawyer, with a strong logical mind unfettered by technicalities, but endowed with considerable respect for the common law. His rulings were always clear and decisive, while the same clearness and decision marked his dealings with fact, and, coupled with a straightforward, unpretentious manner, gave him great influence with juries. In the Court of Appeal he was perhaps not so entirely in his element as at Nisi Prius, but the same combination of sound law, strong common sense, and clear expression, characterized his judgments, marked as they are by a tendency to recall and refute the arguments of counsel, rather than to be expositions of the law applicable to the matter in hand, delivered irrespective of such arguments. His decisions during the three stages of his practical career are too numerous to be referred to particularly, although *Ryder v. Wombwell* (L.R. 3 Ex. 95); *R. v. Bradshaw* (14 Cox C. C. 84); *Household Fire Insurance Company v. Grant* (4 Ex. Div. 216); *Stonor v. Fowle* (13 App. Cas. 20), have been cited as examples. A quaint instance is recorded of his candour. Having sat all day with two Chancery Lords Justices hearing an appeal involving points of equity only, he gave his judgment in these terms:—"Having listened all day to things which I don't think I ever heard of before, I can safely say I am of the same opinion, and for the same reasons." In the course of another judgment (9 Chy. Div. 28) he said, "If juries had to give reasons for their verdict trial by jury would not last five years." He was a staunch upholder on the bench, and as a controversial writer, of the common law both in civil and criminal matters, believing that the less it was interfered with by legislation the better. "Please govern me as little as possible," he was wont to say. In particular he strenuously defended, wherever possible, the principle involved in the words "freedom of contract," diminished (whether rightly or wrongly is a matter of opinion) by modern legislation, S. II. — 44

such as that limiting the relations of landlord and tenant, or master and servant. He earned the reputation of regarding rich corporations with undue favour through his resentment at seeing them unjustly "bled" by juries that sympathized with plaintiffs; and in the case of railway companies he further refused to recognize the effect on their position of the extraordinary powers and privileges given them by Parliament. Reference in this connexion may be made to *Vaughan v. The Taff Railway Company* (3 & 5 Hurlston and Norman's Reports); and the *Hammer-smith Railway Company v. Brand* (Law Reports 4 H.L.), in which the decisions were adverse to the companies, and in which the tendencies last referred to may be traced.

Throughout his legal career Bramwell was constantly in friendly communication with American lawyers, the common law being the bond between them. An expression of his feeling towards American lawyers is to be found in the case of *The Attorney-General v. Sillem* (2 H. & C. 540). In addition to his other qualities as a judge, and particularly his honesty and love of justice, Lord Bramwell's courtesy and consideration towards those practising before him (although he could be peremptory at times when rendered impatient) had won him their personal affection and esteem, so that upon his retirement, which was announced in the long vacation of 1881, exceptional honour was accorded to him, twenty-six judges and a huge gathering of the bar entertaining him at a memorable banquet in the Inner Temple hall. Shortly afterwards, on 8th December, Mr Gladstone wrote to him offering him a peerage, which he accepted, taking the title Baron Bramwell of Hever, from his home in Kent. Thus he had not wholly said good-bye to judicial life, and many of his decisions are to be found in the reports of the House of Lords, notably that in *Vagliano v. The Bank of England* (App. Ca. 1891), in which he and Lord Field differed from the majority. In private life Bramwell had simple tastes and enjoyed simple pleasures. He lived, when not in London, at Four Elms, near Edenbridge. He was extremely fond of music, and himself played the piano. He was fond also of his garden and of animals, particularly dogs. He rode a little at one time, but never shot. He was fond of walking and of swimming, and he played billiards. He was twice married: (1) 1830, to Jane, daughter of Bruno Silva, who died in 1836, and by whom he had one daughter; (2) 1861, to Miss Martha Sinden. He died at Four Elms on 9th May 1892.

At all times Lord Bramwell had been fond of controversy and controversial writing. He had written from time to time upon many topics principally of legal interest in the *Times*, the *Economist*, and elsewhere, but as a peer he had more leisure and also greater freedom than he had had as a judge to deal with the wide variety of questions which interested him, particularly those involving politics (although personally he acknowledged allegiance to no party), and he did so with characteristic vigour, with shrewd insight into the weak parts of his adversary's case, and a still keener appreciation of the strong points of his own. Without being ever intentionally unfair in controversy, he lost nothing by ignoring at times the full meaning of his adversary unless it was expressed in terms that prevented him from doing so. Still the great majority of his letters to the *Times* over his well-known signature B. (he also signed himself at different times Bramwell, G.B. and L.L.), will always afford good reading, and it is interesting to trace the fulfilment or non-fulfilment of his predictions in the light of subsequent events. He joined in 1882 the Liberty and Property Defence League, and some of his writings after that date took the form of pamphlets published by that society. As examples of Lord Bramwell's controversial style may be cited his letters to the *Times*, 24th April 1878 (Employers' Liability and Freedom of Contract); 3rd June 1880 (Hares and Rabbits Bill and Freedom of Contract); 16th and 24th May 1883 (Unearned Increment); for replies see 22nd and 28th May); 12th November 1885 (Mr Joseph Chamberlain and the Enclosure of Commons). Pamphlets, *Laisssez Faire*; "Nationalization of Land," a reply to Henry George's *Progress and Poverty*; "Drink" (for "Drink" see also the *Times*, 10th April 1885), published by the Liberty and Property Defence League;

"Drink, a Rejoinder," *Nineteenth Century Magazine*, June 1885; letters to the *Economist* (Railways), 2nd August 1884, 13th and 20th March 1886; letter on Employers' Liability to Sir Henry Jackson, published as a pamphlet. "The letter of Mr. Baylis exhibits a crass ignorance of the subject on which he writes and a proportionate confidence" (*Times*, 11th November 1886), written by him in reply to a young barrister who had differed from him with regard to the precise status of Serjeants' Inn, may be quoted as an instance of the hard hitting and somewhat intolerant style that he frequently adopted.

Brand, Sir John Henry (1823-1888), President of the Orange Free State, was the son of Sir Christoffel Brand, Speaker of the House of Assembly of the Cape Colony. He was born at Cape Town, 6th December 1823, and was educated at the South African College. Continuing his studies at Leyden, he took the degree of D.C.L. in 1845. He was called to the English bar from the Inner Temple in 1849, and practised as an advocate in the Supreme Court of the Cape of Good Hope from that year until 1863. In 1858 he was appointed professor of Law in the South African College. He was elected president of the Orange Free State in 1863, and subsequently re-elected for five years in 1869, 1874, and 1879. In 1864 he resisted the pressure of the Basutos on the Free State boundary, and after vainly endeavouring to induce Moshesh, the Basuto chief, to keep his people within bounds, he took up arms against them in 1865. This first war ended in the treaty of Thaba Bosigo, 3rd April 1866; and a second war, caused by the treachery of the Basutos, ended in the treaty of Aliwal North, 12th February 1869. In 1871 Brand was solicited by a large party to become president of the South African Republic, and thus unite the two republics; but as the project was hostile to Great Britain he declined to do so, and maintained his constant policy of friendship towards the latter country, where his merits were recognized in 1882 by the well-deserved honour of the G.C.M.G. His watchfulness for the interests of the Orange Free State was sufficiently shown in his despatches on the question of the Diamond Fields in 1872. A fluent speaker, a far-sighted politician, and endowed with great firmness and independence of character, President Brand was respected throughout South Africa. He died on 14th July 1888. (See ORANGE RIVER COLONY.)

Brandenburg, a central province of Prussia, with an area of 15,381 sq. miles, and population of 2,821,695 (1895), the second in point of area and the third in point of population of the provinces of the kingdom. The crops chiefly grown are potatoes, hay, rye, beetroot, oats, barley, wheat, and some tobacco (£138,750 in 1897). In 1897 the live stock embraced 898,298 sheep, 885,487 pigs, 806,066 cattle, and 280,512 horses. In the same year the mines yielded 7,941,632 tons of lignite, valued at £730,900, and the foundries and furnaces produced 27,698 tons of materials, valued at £228,600. In 1898-99 the sugar factories produced 56,693 tons of sugar; the breweries, 146,300,000 gallons of beer; and the distilleries, 6,724,718 gallons of pure alcohol. For further particulars, see under PRUSSIA.

Brandenburg, a town of Prussia, on the Havel, 38 miles W.S.W. of Berlin, capital of the circle of Brandenburg, government-district of Potsdam, province of Brandenburg; station on the Berlin-Magdeburg railway. The town has 8 churches and a synagogue, a high school (Ritterakademie), a gymnasium, 13 real-gymnasias, and 2 higher-grade girls' schools. On Marienberg, to the north-

west of the town, is a tower (1880) to the memory of about 4000 Brandenburgers who fell in the wars of 1864, 1866, and 1870-71. There is considerable shipping and fishing on the river. Population (1880), 28,685; (1890), 37,817; (1900), 49,263.

Brandes, Georg Morris Cohen (1842—), Danish critic and literary historian, generally known as GEORG BRANDES, was born in Copenhagen on 4th February 1842. He became a student in the university in 1859, and first studied jurisprudence. From this, however, his maturer taste soon turned to philosophy and aesthetics. In 1862 he won the gold medal of the university for an essay on *The Nemesis Idea among the Ancients*. Before this, indeed since 1858, he had shown a remarkable gift for verse-writing, the results of which, however, were not abundant enough to justify separate publication. Brandes, indeed, did not collect his poems until so late as 1898. At the university, which he left in 1864, Brandes was much under the influence of the writings of Heiberg in criticism and Søren Kierkegaard in philosophy, influences which have continued to leave traces on his work. From 1865 to 1871 Brandes travelled much in Europe, acquainting himself with the condition of literature in the principal centres of learning. His first important contribution to letters was his *Æsthetic Studies* of 1868, in which, in several brief monographs on Danish poets, his maturer method is already foreshadowed. In 1870 he published several important volumes, *The French Æsthetics of Our Days*, *Criticisms and Portraits*, and a translation of *The Subjection of Women* of John Stuart Mill, whom he had met that year during a visit to England. Brandes now took his place as the leading critic of the north of Europe, applying to local conditions and habits of thought the methods of Taine. He became *docent* or reader in Belles Lettres at the university of Copenhagen, where his lectures were the sensation of the hour. The professor of Æsthetics was the poet Carsten Hauch, a very aged man; when he died in 1872, it was taken as a matter of course that Brandes would succeed him. But the young critic had offended many susceptibilities by his ardent advocacy of modern ideas; he was known to be a Jew, he was convicted of being a Radical, he was suspected of being an atheist. The authorities refused to elect him, but his fitness for the post was so obvious that the chair of Æsthetics remained vacant in the university of Copenhagen, no one else daring to take a post from which Brandes had been rejected. In the midst of these polemics the critic began to issue the most ambitious of his works, the *Main Streams in the Literature of the Nineteenth Century*, of which four volumes appeared between 1872 and 1875. The brilliant novelty of this criticism, as well as the tumult which gathered round the person of the critic, combined to give it unbounded success, and the reputation of Brandes grew apace, not only in his own country, but in Germany and Russia. His subsequent writings have been too numerous to be chronicled here in detail. But among them must be mentioned the monographs on *Søren Kierkegaard* (1877), on *Esias Tegner* (1878), on *Lord Beaconsfield* (1878), and on *Henrik Ibsen* (1899). Brandes has written with great fulness on the main contemporary poets and novelists of his own country and of Norway, and he and his disciples have long been the arbiters of literary fame in the north. His *Danish Poets* (1877), his *Men of the Modern Transition* (1883), and his *Essays* (1889), are volumes essential to the proper study of modern Scandinavian literature. In 1877 Brandes left Copenhagen and settled in Berlin, taking a considerable part in the æsthetic life of that city;

he speaks and writes German like a native. His political views, however, made Prussia uncomfortable for him, and he returned in time to Copenhagen, where he found a whole new school of writers and thinkers eager to receive him as their leader. The most important of his recent works has been his study of Shakespeare, 1897-98, which was translated into English by Mr Archer, and at once took a high position. It is, perhaps, the most authoritative work on Shakespeare, not principally intended for an English-speaking audience, which has hitherto been published in any country. Dr Brandes has recently been engaged on a history of modern Scandinavian literature. In his critical work, which is extended over a wider field than that of any other living writer, Brandes has been aided by a singularly charming style, lucid and reasonable, enthusiastic without extravagance, brilliant and coloured without affectation. In 1900 he collected his works for the first time in a complete and popular edition.

Brandon, a city and port of entry of Manitoba, Canada, on the Assiniboine river, and the Canadian Pacific and Canadian Northern railways, situated in 99° 57' W. and 49° 50' N., 1184 feet above the sea. It is in one of the finest agricultural sections of Manitoba, and contains grain elevators, saw-mills, and grist-mills. It was first settled in 1881, and incorporated as a city in 1882. Population (1891), 3778; (1901), 5380.

Brandywine Creek, a small stream rising in Chester county, in South-east Pennsylvania, and flowing into Christiana Creek in Northern Delaware. Its banks in Pennsylvania were the scene of an engagement in 1777, during the American revolution, between the American forces under Washington and a British army under General Howe, in which the former were defeated.

Brantford, a city and port of entry of Ontario, Canada, situated 22 miles S.S.W. of Hamilton, on the Grand river, and on the Grand Trunk and Toronto, Hamilton, and Buffalo railways. Agricultural implement, plough, engine, bicycle, and stove works and potteries, constitute the most important industrial establishments. It contains an institute for the education of the blind, maintained by the provincial Government, and a ladies' college. The total value of the exports for 1899-1900 was \$993,346, and imports \$1,413,950. Incorporated as a city in 1877, the population in 1881 was 9616; in 1891, 12,753; and in 1901 it was 16,621.

Brasseur de Bourbourg, Charles Étienne (1814-1874), Belgian ethnographer, was born at Bourbourg, near Dunkirk, 8th September 1814. He entered the Roman Catholic priesthood, was professor of ecclesiastical history in the Quebec seminary in 1845, vicar-general at Boston in 1846, and from 1848 to 1863 travelled as a missionary, chiefly in Mexico and Central America. He gave great attention to Mexican antiquities, published in 1857-59 a history of Aztec civilization, and edited a collection of documents in the indigenous languages from 1861 to 1864. In 1863 he announced the discovery of a key to Mexican hieroglyphic writing, but its value is very questionable. In 1864 he was archaeologist to the French military expedition in Mexico, and his *Monumens anciens du Mexique* was published by the French Government in 1866. Perhaps his greatest service was the publication of the *Popot Vuh*, a sacred book of the Indians in the Quichel language, in 1861, along with a Quichel Grammar, and an essay on Central American mythology. In 1871 he brought out his *Bibliothèque Mexico-Guatemalienne*, and in 1869-70 gave the principles of his decipherment of Indian picture-writing in his *Manuscrit Troano, études sur le système graphique et le langue des Mayas*. He died at Nice on 8th January 1874.

His chief merit is his diligent collection of materials; his interpretations are generally fanciful.

Braunau (Czech, *Broumov*), the chief town of a government-district in Bohemia, Austria, near the frontier of Prussian Silesia. It has an imposing Benedictine abbey (1321), and a church (1683) which played an important part in the events leading to the Thirty Years' War still stands. In 1618 the attempt to build a Protestant church was forcibly prevented, an act which was regarded as the immediate occasion of the Protestant insurrection in Bohemia. After the battle of the White Hill, near Prague, the town was deprived of all its privileges, which were, however, in great part restored nine years later. It is now a manufacturing centre (cloth, woollen and cotton stuffs, &c.), and has a considerable trade. Population (1890), 7052; (1900), 7622, chiefly German.

Braunsberg, a town of Prussia, province of East Prussia, 38 miles by rail S.W. of Königsberg, and 5 miles from the shore of the Frisches Haff. Braunsberg

has manufactures of soap, yeast, carriages, bricks, and an active trade in flax, corn, flour, timber, &c. Population (1885), 10,759; (1895), 11,856; (1900), 12,497.

Bray, a maritime town, urban sanitary district, and watering-place in the county of Wicklow, Ireland, on the Dublin, Wicklow, and Wexford railway, 12 miles S.S.E. of Dublin. Formerly the town was situated partly in Wicklow and partly in Dublin, but under the Local Government (Ireland) Act, 1898, the portion in Dublin was added to Wicklow. It is known as the "Irish Brighton," and is the chief watering-place in Ireland. A sea wall and promenade, erected at a cost of £25,000, was opened in 1885, and has since been enlarged. A commodious harbour has been constructed by the Urban District Council, who are also the harbour authority, at a cost of £45,000, which is capable of accommodating steamers and ships of 400 tons burden. The town is lighted by electricity, and is rapidly increasing in size. Population (1881), 6535; (1901), 7284, a number which doubles in the season.

B R A Z I L.

1. GEOGRAPHY AND STATISTICS.

BRAZIL, a country of South America, extends from about 4° N. lat. to 35° 41' S. lat., and from 35° to about 73° W. long. On the north the greater part of the frontier is undefined, but by agreement of 1883 the watershed between the Amazon and Orinoco rivers was accepted as portion of the Venezuelan boundary. The dispute concerning the boundary towards French Guiana was, under a convention of April 1897, referred to a Swiss court of arbitration, which gave its award on 1st December 1900. The boundary follows the Oyapoc river from its mouth to its source, and thence the watershed of the Tumuc Humac mountains to the frontier of Dutch Guiana. Towards Peru the Javary river is regarded as the boundary. The frontier line towards Bolivia is still a matter of dispute. The Acre region, claimed by Bolivia, contains rich rubber forests and has attracted many Brazilians, who refuse to acknowledge the Bolivian claim. On 30th October 1899 a protocol was signed on behalf of the two republics providing for the demarcation of the frontier. Farther south the boundary of Brazil is not disputed, the frontier towards the Argentine Republic having been settled in 1895 by arbitration.

Climate and Topography.—Within the vast area of Brazil are comprised very varied conditions of climate and widely-diversified topographical features. In the south is Rio Grande do Sul, a state consisting, for the most part, of fertile prairie land, suitable for pastoral and agricultural industries, with a temperate, healthy climate, admirably adapted for European settlement. The adjoining state of Santa Catharina has similar characteristics, but is intersected by broken country and low mountain ranges. Farther north lies the state of Paraná with a climate, at the sea-level, humid and almost tropical in summer, but on the grassy, well-watered plateau, some 50 miles from the coast, at a height of 3000 feet, temperate and healthy. In the states of São Paulo, Rio de Janeiro, and Espiritu Santo, the coast-level is tropical and unhealthy, while the highlands of the interior are temperate and pleasant. Inland to the west and north of Rio de Janeiro is the state of Minas, possessing fertile valleys and bold mountain ranges, interspersed with grass-clad tablelands and great areas of forest. Northwards as far as the delta of the Amazon the country, having a

fertile soil and a heavy rainfall, is clothed with dense vegetation and forest growth; but towards the interior the land rises to a height of some 4000 feet, and spreads out into a fairly open plateau with a temperate climate. From the delta of the Amazon inland, for many hundreds of miles, there are low, heavily-wooded lands, intersected by innumerable swamps and streams. To the west and north of the Amazon the territories are practically unexplored, but many of these forest districts are rich in india-rubber trees.

The only important waterways in Brazil are the Pará and the Amazon, with its tributaries in the north, the San Francisco in the east, the Uruguay in the south-west, and the Paraguay in the west, the last giving access to the state of Matto Grosso. The Amazon is navigable as far as Iquitos in Peru, about 350 miles from the Pacific. All the inhabited districts of Brazil are well watered, and rain falls abundantly.

Area and Population.—Brazil, with an area of 3,218,100 square miles, had in 1890 a population of 14,333,915, the average density being thus 4.5 inhabitants per square mile. Of the population, 7,237,932 were males and 7,095,983 were females. The area and population of the twenty states and of the Federal District are given in the subjoined table:—

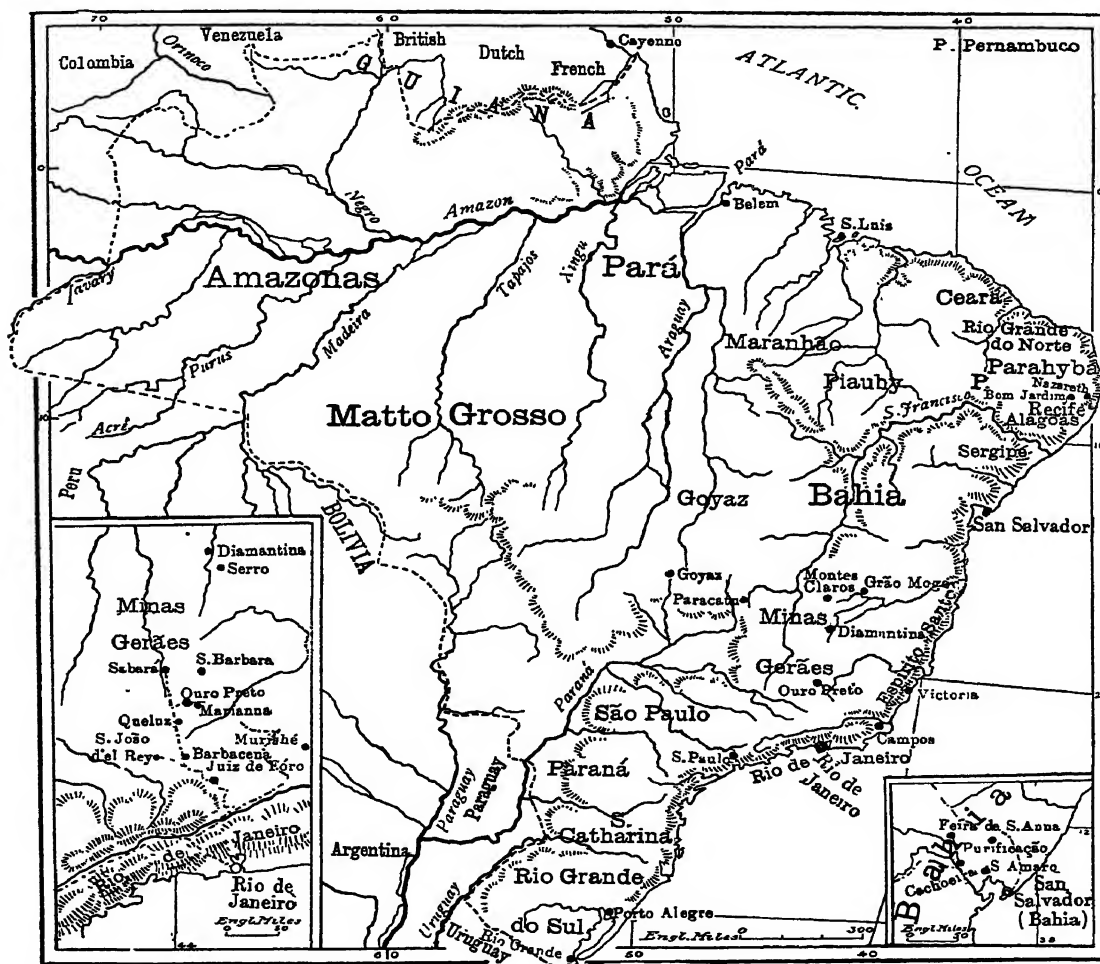

States.	Area in Square Miles.	Population, 1890.	Pop. per Square Mile.
Alagoas . . .	22,580	511,440	22
Amazonas . . .	732,250	147,915	...
Bahia . . .	164,600	1,919,802	12
Ceará . . .	40,240	805,687	20
Espiritu Santo . . .	17,310	135,997	8
Goyaz . . .	288,460	227,572	...
Maranhão . . .	177,510	430,854	2
Matto Grosso . . .	532,550	92,827	...
Minas Gerães . . .	221,890	3,184,099	...
Pará . . .	443,790	328,455	...
Parahyba . . .	28,840	457,232	16
Paraná . . .	85,430	249,491	3
Pernambuco . . .	49,560	1,030,224	21
Piahy . . .	116,490	267,609	2
Rio de Janeiro . . .	26,630	876,884	33
Rio Grande do Norte . . .	22,190	268,273	12
Rio Grande do Sul . . .	91,310	897,455	10
Santa Catharina . . .	28,620	283,769	10
São Paulo . . .	112,280	1,384,753	12
Sergipe . . .	15,090	310,926	20
Federal District . . .	540	522,651	970
Total . . .	3,218,160	14,333,915	4

In these numbers, however, the population is probably much understated, for the great extent of territory and difficulty of communication render a complete enumeration impracticable. An official estimate, supplementing the census returns, puts the total number of inhabitants at 16,330,216. About 25 per cent. of the population are whites, mostly undersized and puny, living in the coast regions; the remainder are mulattoes, negroes, and Indians. There is, however, a large immigration, which is eagerly encouraged by the Government, free passes from Europe, assistance on arrival, and grants of land being provided for settlers. During the twenty-eight years, 1871-98, 1,497,064 immigrants entered Brazil. In the last five years of this period the numbers were:—1894, 63,294; 1895, 164,371; 1896, 157,948; 1897, 112,495; 1898, 53,822. The new-comers in 1898 comprised 33,272 Italians, 11,662 Portuguese, 5943 Spaniards, 669 Austrians and Hungarians, 477 Germans,

Towns.	Population.	Towns.	Population.
Montes Claros (Min. Ger.)	61,555	Muriahé (Min. Ger.)	50,189
Ouro Preto (Min. Ger.)	59,249	Belem (Para)	50,064
Barbacena	57,850	S. João d'El Rey (Min. Ger.)	48,722
Mariana	56,404	Cachoeira (Bahia)	48,352

Purificação (Bahia)	51,602	Paracatu (Min. Ger.)	46,621

Constitution.—On 15th November 1889 the Emperor Dom Pedro II. was dethroned and a Federal Republic proclaimed, under the title of the United States of Brazil. A Congress, convoked by a Provisional Government and elected by popular vote, met on 15th November 1890, and

adopted, on 24th February 1891, the constitution now in force. Each of the old provinces forms a state, administered at its own expense without interference from the Federal Government, except for defence, the maintenance of order (with the consent of the state), and the execution of the federal laws; but fiscal arrangements, in such matters as import duties, stamps, postage, and bank-note circulation, belong to the union. The legislative power is vested in a National Congress of two chambers. The Senate consists of sixty-three members (three for each state and the Federal District), elected for nine years, one-third of the number retiring every three years. Members must be over thirty-five years of age. The Chamber of Deputies contains 212 representatives, chosen for three years; the number sent by any one state must not be less than four, and must not exceed the proportion of one for every 70,000 in-

B.V. Darbishire & O.J.R. Howarth

SKETCH MAP OF BRAZIL

Oxford 1901

247 French, 137 Russians (Jewish), and 129 Swiss. The Italian immigrants betake themselves in great numbers to the coffee plantations in São Paulo, Espirito Santo, and Minas Gerães. In São Paulo alone, in 1899, the Italian population was returned at 1,020,000. Spaniards and Portuguese usually settle in the northern states, where sugar, cotton, and tobacco are grown, or in cities, where they engage in minor trades and industries. The German settlements are mainly in the southern states, Rio Grande do Sul and Santa Catharina, where the German colonists are estimated to number more than 300,000.

The principal towns, with their population as given in the census of 1890, are:—

Towns.	Population.	Towns.	Population.
Rio de Janeiro	522,651	Juiz de Fóro (Min. Ger.)	74,136
San Salvador (Bahia)	174,412	Queluz	68,270
Recife (Pernambuco)	111,556	São Paulo (S. Paulo)	64,934
San Amaro (Bahia)	79,220	Nazareth (Pernambuco)	63,746
Campos (R. Janeiro)	78,036	S. Barbara (Min. Ger.)	62,423
Sabará (Minas Gerães)	77,754	Grão Mogol	62,136
Serro	75,270	Feira de S. Anna (Bahia)	61,758

habitants, as determined by a decennial census. Senators and deputies are elected by direct popular vote, every registered Brazilian over twenty-one years of age, not disqualified for special reasons, being an elector. Members of both chambers are paid. The president and vice-president of the republic are likewise elected by direct vote of the people. The term of office is four years, and the retiring president is not eligible for the succeeding term. The election is held on 1st March in the last year of each presidential period, and the new president assumes office on 15th November following. The president is the head of the executive; he sanctions and promulgates laws, issues decrees, and makes treaties (subject to ratification by Congress). He has supreme command of the army and navy, and (with the consent of Congress) appoints federal judges and diplomatic ministers. He is assisted by a cabinet of ministers, who

are nominated and may be dismissed by himself. The ministers are heads of the various departments of Government, but have not seats in either chamber and are not responsible to Congress for advice given to the president of the republic.

Local Government.—Each state has its own constitution, which must be republican, and each has its own legislative and administrative authorities, with whom the central Government cannot interfere, except through the supreme federal tribunal. The Federal District is administered by a council elected by the citizens of the district, the municipal executive authority being exercised by a prefect appointed for a term of four years by the president of the republic. The number of municipal districts in Brazil is stated to be 892, and of parishes with administrative machinery 1886.

Justice.—The administration of justice is entrusted to a federal supreme court of fifteen judges holding office for life, and to inferior federal courts distributed through the country. The states have also their own tribunals, with which the federal courts may not interfere. Justice, however, both civil and criminal, as administered in Brazil, has fallen into reproach. Judicial appointments in the early years of the republic were made with little regard to fitness for office, and so little confidence is placed in the tribunals that many rather submit to flagrant wrong than seek the redress to which they are entitled.

Education.—Education is in a backward condition, and probably 80 per cent. of the population can neither read nor write. According to the constitution, instruction at all its stages is under lay management. Elementary education is free, but not compulsory. Primary schools are under the care of the states and municipalities. In 1891 the number of such schools was returned at 8793 and of pupils 376,399, but the states do not supply complete information concerning their educational work. Secondary and higher education are under both federal and state control. In the capital the former is given in the National Gymnasium and the Benjamin Constant Institute, which confer degrees, and in the states there are institutions of similar purpose. Higher education is mostly of a professional nature. There are law schools at Pernambuco and São Paulo; medical schools at Rio de Janeiro and Bahia; a polytechnic at Rio de Janeiro; a school of mining at Ouro Preto, and a school of fine arts at Rio de Janeiro, all maintained by the Federal Government. There are also free schools of law, engineering, &c., granting diplomas and degrees; but such institutions must obtain Government recognition, must have a fixed endowment, and must have a Government official present when examinations are held. Private schools of all grades are numerous.

Finance.—The national revenue is derived largely from duties on imports; but an inland revenue stamp duty has been imposed on tobaccos, wines, boots and shoes, candles, and several other classes of merchandise. Formerly customs duties were payable entirely in currency; but a decree of 1899 required that 10 per cent. should be paid in gold, practically increasing the duty on many articles. The greater portion of the expenditure passes through the Department of Finance. The annual revenue and expenditure over a series of years, when stated in currency, show a large increase from year to year, but when stated in sterling they exhibit a remarkable decrease. This discrepancy is explained by the rapid depreciation of the inconvertible paper currency. The revenue and expenditure for 1889 and for each of the years 1894-98, stated in sterling, and the value of the paper milreis in pence, were as follows:—

	Exchange.	Revenue.	Expenditure.
	Pence.	£	£
1889	27	18,094,535	20,943,616
1894	10	11,014,384	15,189,594
1895	10	12,820,378	14,370,098
1896	9	12,523,841	14,021,025
1897	8	9,033,253	10,417,460
1898	7	9,429,720	10,911,560

For 1899 the revenue was estimated at 351,114,000 milreis (or, at 7d., £10,182,300), and the expenditure at 328,623,257 milreis (or £9,530,100); for 1900, revenue, 53,975,543 milreis gold and 312,953,000 paper, and expenditure, 36,974,000 milreis gold and 263,162,000 paper; for 1901, revenue, 58,869,000 milreis gold and 278,565,000 paper; expenditure, 35,799,000 milreis gold and 241,125,000 paper.

In 1888, a year before the establishment of the republican régime, the internal and external national debts amounted to £74,000,000 sterling, with the currency at par. At the end of 1898 the national debt was stated to consist of: external loans, £38,359,200; internal gold loans, 179,268,500 milreis; internal currency loans, 426,813,100 milreis. There were, in addition, a floating debt of 300,000,000 milreis; Treasury bonds to the amount

of £1,000,000, and paper money amounting to 780,000,000 milreis. In 1898 the Government, unable to meet the cost of service of the debt and the payment for railway guarantees, had entered into an arrangement for the issue of a 5 per cent. funding loan to the amount of £10,000,000; the suspension of all amortization for thirteen years; and the withdrawal and incineration of the paper currency *pari passu* with the issue of the loan, the milreis being counted at 18d. The scheme was put in operation in June 1898; by the end of May 1900 the loan emissions amounted to £5,519,982, and paper currency had been destroyed to the amount of 84,672,610 milreis (or 11,091,260 milreis more than the arrangement required). Within the same period the £1,000,000 of Treasury bonds had been paid off, and of the internal gold debt (the service of which, in gold, had disturbed the market) 22,807,000 milreis (£2,534,000) was redeemed and the remainder converted into currency debt. Interest is paid on the external debt at 4, 4½, and 5 per cent.; on the currency debt at 4, 5, and 6 per cent.

Besides the national debt there are Brazilian state debts of considerable importance. In 1899, sixteen states had internal debts amounting, in all, to 81,708,627 milreis; four had floating debts reaching, on the aggregate, 10,311,182 milreis; and five had external debts amounting to £9,168,000 sterling; but of this amount £1,930,750 was due to the Federal Government. The external debts of states were those of São Paulo, £3,224,600; Bahia, £2,013,200, of which £1,300,000 was due to the Federal Government; Minas Geraes, £2,600,000; Espiritu Santo, £700,000; Pernambuco, £630,750, due to the Federal Government.

Defence.—The army consisted in 1899 of 2300 officers and 28,160 non-commissioned officers and men, organized in 40 battalions of infantry, 14 regiments and 1 corps of cavalry, 6 regiments of field, and 6 regiments of garrison artillery, and 2 battalions of engineers. Military service is nominally but not actually compulsory. The organization of an effective National Guard has been proposed. The rifle used is the Mannlicher for all the land forces. In addition to the regular troops there are the armed police, numbering 20,000 men. These are used as soldiers when occasion demands, and for all practical purposes form part of the military organization. Brazil is divided into seven military districts. In the military schools there are 1400 students.

The navy has been largely reinforced in recent years by the purchase of modern vessels, and the rearming and partial reconstruction of several of the older ships. The list of ships available for service now includes 2 armoured and 2 partly armoured turret ships; 6 first-class and 2 second-class cruisers; 1 guard ship; 3 monitors for river work, besides 2 building; 37 torpedo craft of various kinds.

For service afloat there are 4000 seamen, 1000 firemen, 400 marines, and 3000 cadets and boys in the naval schools and training ships. The school at Rio de Janeiro, from which the cadets graduate to the rank of midshipmen, is one of the best of the Brazilian educational establishments; it is selected by many of the prominent Brazilians for their sons, and, as a consequence, many representatives of the leading families of Brazil are found in the naval service. There are four naval arsenals, the principal one at Rio de Janeiro, the others at Bahia, Pernambuco, and Pará. At Rio de Janeiro there is a dry-dock in the naval yard on Cobras Island capable of receiving any of the vessels now on the navy list. There is also a slip for the use of torpedo boats and other craft of smaller dimensions. In the navy the small-arm in use is the Mauser rifle.

Products.—Brazil has exceptional natural resources; and with settled government, and necessary protection for life and property, this wealth must sooner or later be developed. The most important agricultural product is coffee, the cultivation of which has largely extended. When slavery was abolished in 1888 the owners of coffee plantations were brought face to face with two serious difficulties. The freeing of the slaves without compensation inflicted on the owners an enormous monetary loss, for the money laid out in the purchase of negroes had formed a large portion of their working capital, and, moreover, it was doubtful whether the former slaves would work at all after having obtained their freedom. Fortunately for Brazil, the prices for coffee in Europe at this crisis were high, and became abnormally so in 1889 and 1890. Money to work the plantations was easily obtained by mortgage of properties, although the rates of interest charged were very high. At first the negroes were not inclined to work; but after the novelty of the change had passed, large numbers of them returned to the plantations as labourers. To make up the deficiencies, immigration from Italy and Portugal was encouraged and supplied labour more satisfactory than that of the former slaves.

Of late years the wealthier coffee-growers, instead of investing their profits in Government bonds as formerly, have made use of them to extend their plantations. A considerable amount of foreign capital, especially British, has been invested in the industry, and improved methods of cultivation and preparation have come into use. The total coffee production of Brazil in the year 1879-80 and in the eleven years ending 1898 is estimated to have been as follows (in bags of 132 lb):—

Year.	Bags.	Year.	Bags.
1879-80 . . .	3,172,000	1892-93 . . .	6,193,000
1887-88 . . .	3,006,000	1893-94 . . .	4,307,000
1888-89 . . .	6,735,000	1894-95 . . .	6,689,000
1889-90 . . .	4,220,000	1895-96 . . .	6,250,000
1890-91 . . .	5,308,000	1896-97 . . .	8,680,000
1891-92 . . .	7,376,000	1897-98 . . .	11,110,000

For 1898-99 the yield was estimated at 9,280,000, and for 1899-1900 at about 11,500,000 bags.

Next in importance to coffee culture is the production of rubber. The trees from the milky juice of which rubber is manufactured are of several kinds. The *Manihot Glaziovii*, or maniocoba, is worked in the state of Ceará, and its propagation is being tried also in the state of Rio de Janeiro. The *Hancornia speciosa*, or mangabeira, is the rubber plant of Maranhão, and it is also being planted in Bahia. The tree which is most productive, however, is the *Hevea brasiliensis*, or seringueira, growing in the valley of the Amazon. It is found sparsely scattered over the forests on the Amazon and its tributaries, the region of the Purus in Bolivia being regarded as the richest. During five months of the year, August-December, the juice of this tree is gathered by labourers who, for the whole extent of the valley, are estimated to number about 120,000, the number of trees annually tapped being put at about 24,000,000. From the whole valley, including its upper portions in Peru and Bolivia, the rubber is sent down the river to Pará, whence it is shipped under the name of "Pará rubber" to Europe and the United States. The quantity shipped to foreign countries in 1897 amounted to 22,180 tons; in 1898, to 21,880 tons; in 1899, to 25,030 tons. Of the shipments in 1899, 13,660 tons went to the United States of America, and the remainder to Europe.

Apart from coffee and rubber, there has not been remarkable development in the agricultural and forest industries of Brazil. Tobacco, cocoa, and cotton cultivation have slightly extended, but sugar-growing has decreased. The centres of the sugar industry are Bahia and Pernambuco. Food-stuffs, which might be grown abundantly in the country, are imported, the local production of maize, beans, and many other articles of common use being insufficient for local demands.

Cattle-breeding is carried on to a large extent in the states of Minas Geraes, Paraná, Santa Catharina, and Rio Grande do Sul. The southern states have been so greatly disturbed by revolutionary outbreaks that the number of cattle has decreased, in spite of the natural advantages of the country. In Rio Grande do Sul the *saladero* establishments prepare the meat into *tasajo*, or jerked beef.

Minerals.—Mining enterprise may possibly offer attractions for the investment of capital on a large scale. The diamond fields, far from being exhausted, have hardly been prospected. Difficulties of transport have proved a great obstacle; but a French syndicate has undertaken a thorough investigation of the Diamantina district, where the bulk of the stones hitherto exported from Brazil have been found. Gold-mining is also becoming an important industry, especially in the state of Minas. The output is annually increasing, and the required capital is slowly coming forward. Low grade ores are to be found in many districts; but the machinery necessary to work the mines is expensive, and investors are cautious. Iron ore exists in large quantities in several of the states, but no attempt has hitherto been made to work it. Coal has been found in different parts of Southern Brazil, and is regularly mined in Rio Grande do Sul. The output in 1895 was 11,012 tons, and in 1896 13,300 tons. Difficulties of transport have stood in the way of any rapid expansion in the coal-mining industry.

Commerce.—The commerce during recent years has suffered from the effects of the inflation of prices and over-trading which took place in 1890 and 1891; from fluctuation in the value of the currency; from the fall in the price of coffee, the main article of export, and from the additional taxation imposed by the Government in the beginning of 1899. There are no complete or trustworthy statistics of the trade of the republic, such general statements as are published being merely estimates. In 1899 a Commercial Statistical Department was established, a journalist statistician having offered gratuitous service; and hereafter more exact information, at least as regards imports, will probably be supplied. The estimated value in sterling of the imports and exports from 1893 onwards are given as follows:—

Year.	Imports.	Exports.
1893 . . .	£17,789,570	£32,827,826
1894 . . .	15,653,888	27,547,944
1895 . . .	15,420,292	29,015,000
1896 . . .	17,023,012	26,027,137
1897 . . .	21,567,660	26,752,224
1898 . . .	24,486,000	27,442,450
1899 . . .	20,000,000	24,500,000

The imports are mainly textiles, food-stuffs, coal, iron, machinery, and hardware; while the exports consist of coffee, rubber, hides and skins, cocoa, the precious metals, manganese ore, sugar, and

tobacco. The coffee shipments in 1898 were valued at £15,500,000, and the rubber at £4,600,000. The export of hides in the same year amounted to £450,000, and of cocoa, to £400,000. As to the distribution of the trade of the republic, there are no sufficient data. At the port of Rio de Janeiro in 1899 the imports were stated to amount to the value of 229,207,000 milreis, which at 8d. per milreis would be equivalent to £7,640,230. Of this amount 41 per cent. came from Great Britain, 11 from Germany, 10 from France, 9 from the Argentine Republic, 8 from the United States, 6 from Uruguay, and 5 from Portugal. According to British statistics, the imports from Brazil into the United Kingdom in 1899 amounted to the value of £3,959,854, of which £3,089,499 was for rubber. The exports from the United Kingdom to Brazil in the same year amounted to £5,389,540. According to American statistics, the value of the imports from Brazil into the United States in 1899 amounted to \$57,875,747 (£12,038,150), of which \$35,253,010 (£7,332,600) was for coffee, and \$16,999,845 (£3,535,860) for rubber. The exports from the United States to Brazil in the same year amounted to \$12,239,086 (£2,545,720).

The import customs receipts of the republic in 1898 amounted to 245,909,405 milreis; in 1899 to 271,203,228 milreis (or about £8,196,900 in 1898, and £9,040,100 in 1899). Export duties are not levied by the Federal Government, but by the governments of the separate states. In some states taxes on exports are the chief source of revenue. The state of Pará in 1897-98 had a revenue of £568,000, of which £476,000 was derived from export duties, £437,000 being from rubber exports alone.

Foreigners take a large share in the commerce of Brazil, both in high finance and regular trading. The British and German banks practically control the exchange market; and the Banco da Republica, the Brazilian state bank, in spite of many attempts, has not yet proved strong enough to change the existing condition of affairs. As merchants and importers the British element is well represented in most branches of trade, but numerically the Portuguese are stronger. In São Paulo the trade is mostly in the hands of Italians; in Bahia, Santa Catharina, and Rio Grande do Sul, the German influence is very strong.

Manufactures.—Of the manufacturing industries the most important is the production of cotton goods, such as sheetings, gingham, and prints from cotton grown in the northern states, chiefly Pernambuco. There were, in 1899, altogether 134 cotton factories within the republic. In or near Rio de Janeiro were 19, with a total of 288,066 spindles and 10,100 looms, turning out 132,228,000 yards annually. There are several woollen factories in South Brazil. At Rio de Janeiro (Petropolis) there are two silk-mills and two large flour-mills. Other industries more or less prosperous are distilling, brewing, the manufacture of boots and shoes, hats, cord and twine, saddlery, and coarse hempen cloth for coffee sacks.

Shipping.—In 1898 the merchant marine consisted of 229 steamers, with an aggregate net tonnage of 94,262 tons; and 344 sailing vessels, with a total tonnage of 88,000 tons. In recent years the number of vessels engaged in the foreign trade entering and clearing at the port of Rio de Janeiro has considerably declined. In 1896, 1535 vessels of 2,469,628 aggregate tonnage entered, and 1404 of 2,282,999 tons cleared. In 1899, 1077 vessels of 1,916,949 tons entered, and 1019 of 1,859,707 tons cleared. Of the vessels entered in 1899, 432 of 956,362 aggregate tonnage were British; 153 of 330,784 tons were French, 136 of 242,774 were German; and 79 of 166,887 were Italian. The number of vessels engaged in the coasting trade that entered the port in 1899 was 1085, with a total tonnage of 395,498; and the number that cleared was 1085, with a tonnage of 370,447. Since December 1896 the coasting and river trade has been exclusively under the Brazilian flag. The principal steamship company engaged in the coastwise trade was, for ten years, the Lloyd Brazillero with 22 steamers; but the company was not financially successful, and in April 1900 its property was sold for the benefit of creditors. The Government pays an annual subsidy, amounting to 1,476,240 milreis, to the Maranhão and the Pernambuco companies which run between Pernambuco, Ceará, and Sergipe and the island of Fernando de Noronha. For river navigation, including the Amazon, its tributaries, Lakes Norte and Manguaba (state of Alagoas), the Rio das Velhas, and the San Francisco, the Government pays an annual subsidy of 13,334,000 milreis.

Railways.—Railway enterprise has made some progress, but the disordered financial condition of the country has acted as a bar to the free investment of foreign capital. In 1899 the number of miles open to traffic and in construction was—

	Miles.	
	Open.	In Construction.
Property of the Federal Government . . .	2004	...
Subsidized . . .	2445	3720
Without subsidy . . .	995	387
Worked or conceded by State Governments . . .	3279	885
Total . . .	8723	4992

The railway system connects Rio de Janeiro with Santos and São Paulo to the south, and with the states of Minas and Espírito Santo to the north. The remaining railways are in isolated sections at Pernambuco, Bahia, Paranaíba, Santa Catharina, and the eastern and western districts of Rio Grande do Sul. The intention originally was to link these various sections together, and form a trunk line from Pernambuco to Rio Grande, thence making connexion with the Uruguayan railway system. Various definite schemes are in hand for connecting and extending railways and tramways (electric and other); but, between judicial embargo and Government imposts, success in such enterprises is difficult to attain.

Posts and Telegraphs.—The postal service of Brazil shows a large annual deficit, on account of the vastness of the country, the difficulties of communication, and the great abuse of the franking privilege. In 1893 there were 2826 post offices, and the mails carried 33,441,000 letters and post-cards, and 37,674,000 samples and printed packets. The telegraph system of Brazil extends over nearly all the country, and is under Government control (some cable lines only excepted). At the close of 1896 the trunk lines were 4250 miles long, with 14,520 miles of wire; the branch lines, 8300 miles, with 10,620 miles of wire; or a total of 12,550 miles, with 25,140 miles of wire. There were also 1770 miles of line along the railways. At the same date there were 376 telegraph stations (45 of which had telephone service) and 17 cable stations. The service, notwithstanding the transmission of more than 1,300,000 telegrams, showed a deficit of 5,000,000 milreis, due to too low rates and privileges to officials and the press.

Money and Credit.—The standard of value is gold, the monetary unit being the gold milreis, worth 2s. 2½d. at par. The 10-milreis gold piece weighs 8·9648 grammes, ·916 fine, and thus contains 8·2178 grammes of pure gold. The 2-milreis silver piece weighs 25·25 grammes, ·916 fine. The existing currency, however, is almost entirely paper, which, owing to the large emissions made in the earlier years of the republic, is of depreciated value. The lowest point was reached in April 1893, when the paper milreis was worth only 5·81 pence. In June 1893 the scheme for the withdrawal of the paper money was put in force, and by the end of May 1900 the amount had been reduced from 785,941,758 milreis to 701,269,148 milreis. In addition to this arrangement two funds have been established—one for the redemption of the paper currency, the other for guaranteeing the notes continuing to circulate. Into the latter fund will be paid 5 per cent. of the import duties payable in gold, and moneys from other sources, including the amount received or to be received from the Bank of the Republic. When this bank was reorganized in 1897 it was agreed that its debt due to the Treasury should be extinguished within twenty years. But early in 1900 an arrangement was made whereby the whole amount of 186,000,000 milreis, comprising 66,000,000 milreis due from the bank itself, 80,000,000 from the industrial *bonuses* account, and 40,000,000 from the mortgage bank account, should be extinguished by a present payment of 25,000,000 milreis (at 8d.), and further payments in four instalments amounting to another 25,000,000 milreis within two years. The metric system of weights and measures was made compulsory in 1874, but the old system has lingered on.

2. RECENT HISTORY.

Under the long reign of Dom Pedro II. progress and material prosperity made steady advancement in Brazil. Occasional political outbreaks occurred, but none of very serious nature except in Rio Grande do Sul, where a long guerilla warfare was carried on against the

imperial authority. The emperor occupied himself to a far greater extent with the economic development of his people and country than with active political life. Unostentatious in his habits, Dom Pedro always had at heart the true interests of the Brazilians. Himself a highly-educated man, he sincerely desired to further the cause of education, and devoted a large portion of his time to the study of this question. His extreme Liberalism prevented his opposing the spread of Socialist doctrines preached far and wide by Benjamin Constant. Begun about 1880, this propaganda took deep root in the educated classes, creating a desire for change and culminating in the military conspiracy of November 1889, by which monarchy was replaced by a Republican form of government.

At first the revolutionary propaganda produced no personal animosity against the emperor, who continued to be treated by his people with every mark of respect and affection, but this state of things gradually changed. In 1864 the Princess Isabella, the eldest daughter of the emperor and empress, had married the Conde d'Eu, a member of the Orleans family. The marriage was never popular in the country, owing partly to the fact that the Conde d'Eu was a reserved man who made few intimate friends and never attempted to become a favourite. Princess Isabella was charitable in many ways, always ready to take her full share of the duties falling upon her as the future empress, and thoroughly realizing the responsibilities of her position; but she was greatly influenced by the clerical party and the priesthood, and she thereby incurred the hostility of the Progressives. When Dom Pedro left Brazil for the purpose of making a tour through Europe and the United States he appointed Princess Isabella to act as regent, and she showed herself so swayed in political questions by Church influence that Liberal feeling became more and more anti-dynastic. Another incident which gave strength to the opposition was the sudden abolition of slavery without any compensation to slave-owners. The planters, the principal possessors of wealth, regarded the measure as unnecessary in view of the Act which had been passed in 1885 providing for the gradual freeing of all slaves. The arguments used were, however, of no avail with the regent, and the decree was promulgated on 13th May 1888. No active opposition was offered to this measure, but the feelings of unrest and discontent spread rapidly.

Towards the close of 1888 the emperor returned and was received by the populace with every demonstration of affection and esteem. Even among the advocates of Republicanism there was no intention of dethroning Dom Pedro, excepting a few extreme members of the party, who now gained the upper hand. They argued that it would be much more difficult to carry out a successful *coup d'état* when the good-natured, confiding emperor had been succeeded by his more suspicious and energetic daughter. Discontented officers in the army and navy rallied to this idea, and a conspiracy was organized to depose the emperor and declare a republic. On 14th November 1889 the palace was quietly surrounded, and on the following morning the emperor and his family were placed on board ship and sent off to Portugal. A Provisional Government was then formed and a proclamation issued to the effect that the country would henceforth be known as the United States of Brazil, and that in due time a republican constitution would be framed. The only voice raised in protest was that of the minister of war, and he was shot at and severely wounded as a consequence. Dom Pedro, completely broken down by the ingratitude of the people whom he had loved so much and laboured for so strenuously, made no attempt at resistance. The Repub-

lican Government offered to compensate him for the property he had held in Brazil as emperor, but this proposal was declined. His private possessions were respected, and were afterwards still held by Princess Isabella.

The citizen named as president of the Provisional Government was General Deodoro da Fonseca, who owed his advancement to the personal friendship and assistance of Dom Pedro. Second in authority was placed General Floriano Peixoto, an officer also under heavy obligations to the deposed monarch, as indeed were nearly all of those who took active part in the conspiracy.

Though the overthrow of the imperial dynasty was totally unexpected throughout, the new *régime* was accepted without any disturbances. Under the leadership of General Deodoro da Fonseca a prætorian system of government, in which the military element was all-powerful, came into existence, and continued till February 1891, when a National Congress assembled and formulated the constitution for the United States of Brazil. The former provinces were converted into states, the only right of the Federal Government to interfere in their administration being for the purposes of national defence, the maintenance of public order, or the enforcement of the federal laws. Under the terms of the constitution the legislative authority is exercised by the National Congress, with the assent of the president of the republic. Congress consists of the senate and the chamber of deputies, and meets annually on 3rd May unless specially convoked for another day. The ordinary sessions last for four months, but may be prorogued beyond that period. No member of congress, after his election, can make any contract with the executive power, or accept any commission or paid office, except such as are diplomatic, military, or imposed by law, nor can any member be a director of any company receiving a subsidy from the Federal Government. Deputies and senators are paid; they cannot be ministers of state and retain their seats in congress. The president of the republic, in whom is vested the executive authority, is elected by the direct vote of the people, as is also the vice-president. The election is held on 1st March, and the term of office is four years. The outgoing president is not eligible for election for the succeeding term. All citizens over 21 years of age, properly inscribed and not being beggars, "illiterates," soldiers serving in the army or members of monastic orders under vows of obedience, have the franchise. The fiscal arrangements of the constitution provide that import duties, stamps, post office revenue, and bank-note circulation are the property of the Federal Government; but export duties, formerly an imperial source of revenue, belong to the states. The Constitution of the United States of America was taken as a model for drawing up that of Brazil, and the general terms were as far as possible adhered to.

General da Fonseca and General Floriano Peixoto were elected to fill the offices of president and vice-president until 15th November 1894. This implied the continuance of prætorian methods of administration. The older class of more conservative Brazilians, who had formerly taken part in the administration under the emperor, withdrew altogether from public life. Many left Brazil and went into voluntary exile, while others retired to their estates. In the absence of these more respectable elements, the government fell into the hands of a gang of military adventurers and unscrupulous politicians, whose only object was to exploit the national resources for their own benefit. As a consequence, deep-rooted discontent rapidly arose. A conspiracy, of which Admiral Wandenkolk was the prime instigator, was discovered, and those who had taken part in it were banished to the distant state

of Amazonas. Disturbances then broke out in Rio Grande do Sul, in consequence of disputes between the official party and the people living in the country districts. Under the leadership of Gumerindo Saraiva the country people broke into open revolt in September 1891. This outbreak was partially suppressed, but afterwards it again burst into flame with great vigour. In view of the discontent, conspiracies, and revolutionary movements, President da Fonseca declared himself dictator. This act, however, met with such strong opposition that he resigned office on 23rd November 1891, and Vice-President Floriano Peixoto assumed the presidency.

Floriano Peixoto had been accustomed all his life to use harsh measures. For the first year of his term of office he kept seditious attempts in check, but discontent grew apace. Nor was this surprising to those who knew the corruption in the administration. Concessions and subsidies were given broadcast for worthless undertakings in order to benefit the friends of the president. Brazilian credit gave way under the strain, and evidences were not wanting at the beginning of 1893 that an outburst of public opinion was not far distant. Nevertheless President Peixoto made no effort to reform the methods of administration. Meanwhile, the revolution in Rio Grande do Sul had revived; and in July 1893 the Federal Government was forced to send most of the available regular troops to that state to hold the insurgents in check.

On 6th September prevailing discontent took definite shape in the form of a naval revolt in the Bay of Rio de Janeiro. Admiral Custodio de Mello took command of the naval forces, and demanded the resignation of the president. General Peixoto replied by organizing a defence against any attack from the squadron. Admiral Mello, finding that his demands were not complied with, began a bombardment of the city, but did not effect his purpose of compelling Peixoto to resign. The foreign ministers then arranged a compromise between the contending parties, to the effect that President Peixoto should place no artillery in the city, on condition that Admiral Mello should refrain from bombarding the town, provided the president did not place in it heavy artillery. Shortly afterwards the cruiser *Republica* and a transport ran the gauntlet of the Government forts at the entrance of the bay, and proceeded south to the province of Santa Catharina, taking possession of Desterro, its capital. A Provisional Government was proclaimed by the insurgents, with headquarters at Desterro, and communication was opened with Gumerindo Saraiva, the leader of the insurrection in Rio Grande do Sul. It was proposed that the army of some 10,000 men under his command should advance northwards towards Rio de Janeiro, while the insurgent squadron threatened the city of Rio. In November Admiral Mello left Rio de Janeiro in the armoured cruiser *Aquidaban* and went to Desterro, the naval forces in Rio Bay being left in charge of Admiral Saldanha da Gama, an ardent Monarchist, who had thrown in his lot with the insurgent cause. All was, apparently, going well with the revolt, Saraiva having invaded the states of Santa Catharina and Paraná, and defeated the Government troops in several encounters. Meanwhile, President Peixoto had fortified the approaches to the city of Rio de Janeiro, bought vessels of war in Europe and the United States, and organized the National Guard.

Early in 1894 dissensions occurred between Saraiva and Mello, which prevented any advance of the insurgent forces, and allowed Peixoto to perfect his plans. Admiral da Gama, unable to leave the Bay of Rio de Janeiro on account of lack of transport for the sick and wounded and the civilians claiming his protection, could do no more than wait for Admiral Mello to return from Desterro.

In the meantime the ships bought by President Peixoto arrived off Rio de Janeiro and prevented da Gama from escaping. On 15th March 1894 the rebel forces evacuated their positions on the islands of Villegaignon, Cobras, and Enxadas, abandoned their vessels, and were received on board two Portuguese warships then in the harbour, whence they were conveyed to Montevideo. The action of the Portuguese commander was prompted by a desire to save life, for, had the rebels fallen into the hands of Peixoto, they would assuredly have been executed.

When the news of the surrender of Saldanha da Gama reached Gumerindo Saraiva, then at Curitiba in Paraná, he proceeded to retire to Rio Grande do Sul. Government troops were despatched to intercept his retreat, and in one of the skirmishes which followed Saraiva was killed. The rebel army then dispersed. Admiral Mello made an unsuccessful attack on the town of Rio Grande, and then sailed to Buenos Ayres, there surrendering the rebel squadron to the Argentine authorities, by whom it was immediately delivered to the Brazilian Government. After six months of civil war peace was once more established, but there still remained some small rebel groups in Rio Grande do Sul. These were joined by Admiral da Gama and a number of the naval officers, who had escaped from Rio de Janeiro; but in June 1895 the admiral was killed in a fight with the Government troops. After the cessation of hostilities, the greatest barbarities were practised upon those who, although they had taken no part in the insurrection, were known to have desired the overthrow of President Peixoto. The Baron Cerro Azul was shot down without trial; Marshal de Gama Eza, an old imperial soldier of eighty years of age, was murdered in cold blood, and numerous executions of men of lesser note took place, among these being two Frenchmen for whose death the Brazilian Government was subsequently called upon to pay heavy compensation.

General Peixoto was succeeded as president on 15th November 1894 by Dr Prudente de Moraes Barros. It was a moot question whether Peixoto, after the revolt was crushed, would not declare himself dictator; certainly many of his friends were anxious that he should follow this course, but he was broken down by the strain which had been imposed upon him, and was glad to surrender his duties. He did not recover his health, and died shortly afterwards.

From the first day that he assumed office, President Moraes showed that he intended to suppress prætorian systems and reduce militarism to a minimum. This policy received the approval and sympathy of the majority of Brazilians, but naturally met with bitter opposition from the military element. The president gradually drew to him some members of the better Conservative class to assist in his administration, and felt confident that he had the support of public opinion. Early in 1895 murmurings and disorderly conduct against the authorities began to take place in the military school at Rio de Janeiro, which had always been a hotbed of intrigue. Some of the officers and students were promptly expelled, and the president closed the school for several months. This salutary lesson had due effect, and no more discontent was fomented from that quarter. Two great difficulties stood in the way of steering the country to prosperity. The first was the chaotic confusion of the finances resulting from the maladministration of the national resources since the deposition of Dom Pedro II., and the corruption that had crept into every branch of the public service. Much was done by President Moraes to correct abuses, but the task was of too herculean a nature to allow of accomplishment within the four years during which he was at the head of affairs. The second difficulty was the war waged by religious fanatics under the leadership of Antonio

Maciel, known as "Conselheiro," against the constituted authorities of Brazil.

The story of Conselheiro is a remarkable one. A native of Pernambuco, when a young man he married against the wishes of his mother, who took a violent dislike to the bride. Shortly after the marriage the mother assured her son that his wife held clandestine meetings with a lover, and stated that if he would go to a certain spot not far from the house that evening he would himself see that her assertion was true. The mother invented some plea to send the wife to the trysting-place, and then, dressing herself in male clothing, prepared to come suddenly on the scene as the lover, trusting to be able to make her escape before she was recognized. The three met almost simultaneously. Conselheiro, deeming his worst suspicions confirmed, shot and killed his wife and his mother before explanations could be offered. He was tried and allowed to go at liberty after some detention in prison. From that time Conselheiro was a victim of remorse, and to expiate his sin became a missionary in the *sertao* or interior of Brazil among the wild Jagunço people. He built places of worship in many different districts, and at length became the recognized chief of the people among whom he had thus strangely cast his lot. Some few years ago Conselheiro formed a settlement near Canudos, situated about 400 miles inland from Bahia. Difficulty arose between the governor of Bahia and this fanatical missionary, with the result that Conselheiro was ordered to leave the settlement and take away his people. This order was met with a sturdy refusal to move. Early in 1897 a police force was sent to eject the settlers, but encountered strong resistance, and suffered heavy loss without being able to effect the purpose intended. In March 1897 a body of 1500 troops, with four guns, was despatched to bring the Jagunços to reason, but was totally defeated. An army comprising some 5000 officers and men was then sent to crush Conselheiro and his people at all costs. Little progress was made, the country being difficult of access and the Jagunços laying ambushes at every available place. Finally strong reinforcements were sent forward, the minister of war himself proceeding to take command of the army, now numbering nearly 13,000 men. Canudos was besieged and captured in September 1897, Conselheiro being killed in the final assault. The expense of these expeditions was very heavy, and prevented President Moraes from carrying out many of the retrenchments he had planned.

Soon after the Canudos affair a conspiracy was hatched to assassinate the president. He was watching the disembarkation of some troops when a shot was fired which narrowly missed him, and killed General Bitencourt, the minister of war. The actual perpetrator of the deed, a soldier, was tried and executed, but he was apparently ignorant of the persons who procured his services. Three other men implicated in the conspiracy were subsequently sentenced to imprisonment for a term of thirty years. The remainder of the presidency of Dr Moraes was uneventful; and on 15th November 1898 he was succeeded by Dr Campos Salles, who had previously been governor of the state of São Paulo. President Salles publicly promised political reform, economy in the administration, and absolute respect for civil rights, and speedily made efforts to fulfil these pledges.

Brazil lacks to-day the first principles of Republican government. The people have no real voice in the election of congress or president. Political representation is governed by groups forming miniature oligarchies in the different states, and these autocratically determine how the elections shall result. Only a small proportion of the population entitled to vote can be induced to attend the

ballot, those who do so only coming forward because of influence brought to bear upon them, and not of their own free will. The great mass of the population is not at present capable of understanding the meaning of political freedom, and of the responsibility which such a state of affairs entails upon the inhabitants of any country where universal suffrage is granted. (C. E. A.)

Brazil, capital of Clay county, Indiana, U.S.A., situated in the western part of the state, 16 miles E. of Terre Haute, at an altitude of 648 feet. It is a coal-mining town of some importance, and the point of intersection of four railways. Population (1880), 3441; (1890), 5905; (1900), 7786.

Brazza, an island in the Adriatic, off the coast of Dalmatia. Population (1900), 24,465. It is the largest of the Dalmatian islands as well as the most thickly populated and fertile. The port of Milná is now a station of the Austrian Lloyd, and is provided with shipwrights' wharves. There are some twenty-five hamlets in the island. The cultivation of the silkworm is now included among the resources of the inhabitants.

Brazza, Pierre Paul François Camille de, COUNT DE SAVORGNAN (1852—), French explorer and administrator, of Italian extraction, was born on 26th January 1852, on board a vessel in the harbour of Rio de Janeiro. He was educated at the Jesuits' College at Paris, and, although a foreigner, served in the French navy. In 1874 he was naturalized as a Frenchman, and in 1875 was sent on a mission to explore the basin of the river Ogowe, in the neighbourhood of the French colony of the Gaboon river in Western Africa. The exploration occupied him three years, in which, notwithstanding his success in conciliating the natives, he underwent great hardships. He nevertheless proved the practicability of penetrating into Central Africa by way of the Ogowe, and in 1879 was despatched on another expedition by the African Association of France. In the course of this exploration M. de Brazza and his companions established twenty-seven posts, including the towns of Francheville and Brazzaville, and greatly extended the sphere of French influence by treaties with the native chiefs. He returned in 1882, and in 1883 was despatched by the French Government with a commission to consolidate French authority in the country. Having organized the administration as well as circumstances permitted, he returned to France and was made commissary-general of the new settlements in 1886. In 1887 he departed to assume the government, found the colony suffering from discord, and was obliged by sickness to return for a time. Upon his recovery he went out again, and organized another important expedition in 1891. He finally returned to France in 1897.

Brazzaville. See FRENCH CONGO.

Brechin, a royal and parliamentary burgh (Montrose group) of Forfarshire, Scotland, 8½ miles W.N.W. of Montrose by road; now the terminus of two branches of the Caledonian railway. Recent erections are Episcopal, United Free, and Established churches, a public library, new municipal buildings, new post office, and new railway station. The ancient cathedral is to be restored. Population (1881), 9031; (1901), 8941.

Breckinridge, John Cabell (1821-1875), American soldier and statesman, was born near Lexington, Kentucky, on 21st January 1821. He graduated at Centre College, and for many years was a successful lawyer in Lexington. He was major of a regiment of Kentucky volunteers in the Mexican war. Subsequently he became a member of the Kentucky House

of Representatives, and then for two terms was a representative in Congress. From 1857 to 1861 he was vice-president of the United States. He belonged to the pro-slavery branch of the Democratic party, and was its candidate for the presidency in 1860, in opposition to Stephen A. Douglas. In the electoral college 72 votes were cast for him, 180 for Lincoln, 39 for Bell, and 12 for Douglas. He became United States senator from Kentucky in March 1861, but soon joined the Confederate army, and was expelled from the United States Senate. As major-general in the Confederate service he achieved much distinction. He was secretary of war of the Confederacy from January to April 1865, when that government collapsed. He escaped to Cuba and went to Europe, but in 1868 he returned to his practice as a lawyer. He died at Lexington, 17th May 1875.

Brecon, Brecknock, or Brecknockshire, a county of South Wales, bounded on the N.W. by Cardigan, on the N. and N.E. by Radnor, on the E. by Hereford and Monmouth, on the S. by Monmouth and Glamorgan, and on the W. by Carmarthen.

Area and Population.—The area of the ancient county is 475,224 acres, or 743 square miles; population (1881), 57,746; (1891), 57,031 (of whom 28,509 were males, and 28,522 females, the number of persons per square mile being 77, and of acres to a person 8·33); (1901), 59,906. The area of the administrative county is 469,894 acres, with a population in 1891 of 51,393. The area of the registration county is 458,652 acres, with a population in 1891 of 52,872. Within the registration area there was between 1881 and 1891 a decrease in the population of 2·34 per cent. The excess of births over deaths between 1881 and 1891 was 5691, but the resident population decreased by 1268. The following table gives the numbers of births, deaths, and marriages, with the number and percentage of illegitimate births for 1880, 1890, and 1898 :—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				Number.	Per Cent.
1880	370	1627	1126	116	7·1
1890	422	1534	1018	89	5·8
1898	345	1574	919	84	5·3

There were in the county (in 1891) 203 natives of Scotland, 308 natives of Ireland, and 122 foreigners, while 31,086 of the population could speak English, 5228 Welsh, and 13,699 English and Welsh.

Constitution and Government.—The county returns one member to parliament, and also contains part of the parliamentary borough of Merthyr Tydfil. There is one municipal borough, Brecon. The urban districts are Brynmawr, Builth, and Hay. Brecknock is in the South Wales circuit, and assizes are held at Brecon, which has also a separate commission of the peace. The ancient county, which is partly in the diocese of Llandaff and partly in that of St. Davids, contains sixty-six entire parishes and districts, and parts of three others.

Education.—The number of elementary schools on 31st August 1899 was 87, of which 42 were board and 45 voluntary schools, 37 of the latter being National Church of England schools, and 8 "British and other." The average attendance at voluntary schools was 3268, and at board schools 5134. The total school board receipts for the year ending 29th September 1899 were nearly £19,863. The income under the Agricultural Rates Act was £980.

Agriculture.—Only a little more than five-twelfths of the county is under cultivation, and of this about three-fourths is in permanent pasture. There are also nearly 205,000 acres in hill pasture, and about 14,000 acres under woods. Oats occupy more than half the acreage under corn crops, barley more than one-fifth, and wheat about one-sixth. About four-fifths of the green crop area is under turnips, and less than one-seventh under potatoes. The following table gives the larger main divisions of the cultivated area at intervals of five years from 1880 :—

Year.	Total Area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	200,205	30,292	6817	22,428	136,442	4226
1885	204,483	27,455	7138	23,498	143,170	3072
1890	206,464	25,709	7517	19,555	151,203	2467
1895	202,345	22,866	7129	19,714	151,456	1149
1900	203,406	21,422	6908	20,893	153,208	969

The following table gives particulars regarding the live stock for the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	11,182	35,668	13,576	381,411	7421
1885	12,235	39,736	15,554	386,717	9423
1890	12,418	38,812	15,473	448,377	9723
1895	12,785	40,014	15,117	456,069	9813
1900	12,065	41,920	15,782	489,417	8232

Industries and Trade.—According to the report for 1898 of the chief inspector of factories (1900), the total number of persons employed in textile and non-textile factories and workshops in 1897 was 1073 as compared with 995 in 1896. Non-textile factories claim the large majority, and workshops nearly all the remainder. The number of persons employed in the mining industry in 1899 was 1968. The most valuable mineral is coal (chiefly anthracite). The following table gives particulars of the output in 1890 and 1899:—

	1890.	1899.
Tonnage	259,260	383,465
Value	£109,563	£142,930

Much valuable limestone is also obtained; 300,151 tons, valued at £41,892, being raised in 1899. In the same year 25,919 tons of gravel and sand were raised, and 75,413 tons of sandstone.

AUTHORITIES.—JONES. *History of the County of Brecknock*, 2 vols. Brecknock, 1805-1809.—POOLE. *Illustrated History of Brecknockshire*, 1886.—KILNER. *Four Welsh Counties*. London, 1891. See also the Guides to South Wales. (T. F. H.)

Breda, a town and railway station (1886) in the province of North Brabant, Netherlands, 30 miles N.N.E. of Antwerp, situated on the Mark, at its junction with the Aa, where the river becomes navigable. There is connexion by steam tram with Antwerp. The mausoleums (ascribed to Michael Angelo) of Engelbert and Henry of Nassau in the Protestant church are highly interesting. The fortress has been dismantled. Population, 26,097.

Bredow, a village of Prussia, in the province of Pomerania, immediately N. of Stettin, of which it virtually forms a suburb. Here are the famous Vulcan iron-works and shipbuilding yards (where the *Deutschland* and the *Kaiser Wilhelm der Grosse*, which broke the Atlantic record, were built), and also sugar, cement, and other factories. Population (1885), 12,715; (1900), 19,992.

Bregentz, or BREGENZ, chief town of the district of the same name in Vorarlberg, Austria, as also of that crown-land. It is a port on Lake Constance and a station on the Austrian state railway. In 1890 the population of the district was 41,824, all German and (with the exception of 420 Protestants) Catholic; in 1900, 46,216. Population of town (1869), 3686; (1890), 6739; (1900), 7595. It has a garrison of 519 men. Numerous Roman antiquities have been placed in the provincial museum. The town has acquired considerable importance through the railway and a steamship service on the lake, which has promoted the trade in corn, cattle, timber, animal products, &c. The principal industries are cotton spinning and weaving, the manufacture of silk, articles of jewellery, woodwork, and hardware.

Bremen, a city of Germany, capital of the free state of Bremen, on both banks of the Weser, 46 miles from the North Sea and 71 miles by rail S.W. of Hamburg. By the completion of engineering works on the Weser in 1887-99, at a total cost of £1,700,000, whereby the river has, amongst other improvements, been straightened and deepened to 18 feet, large ocean-going vessels are now able to steam right up to the city itself. It has excellent railway connexions with the chief industrial districts of Germany. Its trade, however, like that of Hamburg, is predominantly a transit trade; especially is it important as the importer

of the raw products of the United States. The growth of the commerce of the port of Bremen-Bremerhaven is illustrated by the following statistics:—The value of the total imports (both sea-borne and by river and rail) increased from £22,721,700 in 1883 to £44,657,100 in 1899; the imports from the United States, from £9,755,000 in 1883 to £15,099,800 in 1899; but from Great Britain they decreased from £3,040,000 in 1883 to £1,357,000 in 1894, though they rose again to £3,053,400 in 1899. The countries, in addition to those already named, from which imports principally come are Germany, Russia, the republics of South America, the Far East, and Australia. The exports amounted in value to a total of £26,096,500 in 1883, a sum which reached £43,043,700 in 1899. The exports to the United States increased from £3,985,000 in 1883 to £6,639,200 in 1897, but in 1899 dropped to £3,849,200. The exports to Great Britain amounted to £1,020,000 in 1883, and to £2,621,000 in 1899. As regards the shipping, the number of vessels which entered the ports of the free state (*i.e.*, Bremen city, Bremerhaven, and Vegesack) increased from 2869 of 1,258,529 aggregate tonnage, in 1883, to 4642 of 2,464,800 tons in 1898; at Bremen-Bremerhaven there arrived 4128 vessels of 2,406,748 tons in 1899. In addition, 1557 vessels of 375,300 tons arrived, belonging to the inland (river) navigation, in 1898. The arrivals under the British flag at the free state ports increased from 389 of 514,310 tons in 1892, to 407 of 661,149 tons in 1899. At the end of 1883 the mercantile fleet of Bremen (state) consisted of 356 sea-going vessels, aggregating 307,559 tons, 99 of these, measuring 89,046 tons, being steamships. By 1899 this fleet had increased to 536 vessels of 566,688 tons. Out of this total 380 vessels of 475,763 tons, or 83.9 per cent. of the total tonnage, belonged to the city of Bremen, which is indeed the seat of some of the more important of the German shipping companies, especially of the North German Lloyd (founded in 1856), which at the end of 1898 possessed a fleet of 73 steamboats of 266,138 tons, besides over 100 lighters and similar craft. Bremen shares with Hamburg the position of being one of the two chief emigration ports of Germany. There are three docks, all to the north-west of the city—namely, the free harbour (which was opened in 1888), the winter harbour, and the timber and industrial harbour; but it has been decided to make a new basin, 7200 feet long, below the present docks, with a separate basin for ships to turn in; also, the area of the timber dock is to be enlarged. Shipbuilding yards, jute-mills, flour-mills, and oil-mills exist on a large scale. A thorough restoration of the cathedral was begun in 1888, and a new tower was added in 1898-99. The church of Our Lady, dating from the 12th and 13th centuries, was restored in 1893, and the 12th-century Romanesque church of St Stephen in 1891. The most important and most imposing amongst the new architectural additions to the city are the post office (1878); the law courts (1891-95), a German Renaissance building; the German National Bank (1896); the Municipal Museum for Natural Science, Ethnology, and Commerce (1896), with several collections; and the city library, of about 115,000 vols., erected in the Dutch Renaissance style in 1895-96. The principal ornamental memorials and useful institutions embrace a gigantic "Roland" statue, symbolical of the city's authority; the Willehad fountain (1883); the monument of the 1870-71 war (1875); the Centaur fountain (1891); an equestrian statue of the Emperor William I. (1893); the Art Exhibition; and an industrial art museum. It is a peculiarity of the domestic accommodation of Bremen that the majority of the houses, unlike the custom in other German towns, are inhabited

each by one family only. Population (1890), 125,684; (1895), 141,894; (1900), 163,418.

The FREE STATE OF BREMEN has an area of 99 square miles, and a population of 156,723 (1880); 180,443 (1890); 224,697 (1900). The constitution was revised in 1875, 1878, and again in 1894. The executive consists of a senate of 16 members, elected for life by the House of Burgesses. The House of Burgesses numbers 150 members, of whom 14 are elected by university graduates, 42 by the merchants, 22 by the mechanics and manufacturers, 44 by the other taxpayers of the city, 12 by the towns of Vegesack and Bremerhaven, and 16 by the country districts. In 1895, 93·8 per cent. of the population, namely 184,360, out of 196,404, professed the creed of the Evangelical Lutheran church, 8686 were Roman Catholics, and less than 1000 were Jews. In 1897 there were in the state 6482 horses, 16,119 head of cattle, 14,875 pigs, and only 522 sheep. The state revenue was estimated for 1899-1900 at £1,266,100, and the expenditure at £1,595,400. The state contribution to the imperial exchequer amounted to £98,910 in 1900. In 1900 the state public debt amounted to £9,043,770. (J. T. BE.)

Bremerhaven, a seaport town of Germany, in the free state of Bremen, at the mouth of the Weser (E. bank), 38 miles by rail N. of the city of Bremen, of which it is the outer port. Commercial and shipping statistics are included in the returns for the city of Bremen (*q.v.*). The Emperor dock (1876) was very considerably enlarged at a cost of £900,000 in 1897-99. This, together with the north portion of the "new" dock (1851), constitutes the free harbour, which is being enlarged by the excavation of a new basin. Here are the workshops and dry docks of the North German Lloyd. The town possesses a technical institute, a natural history collection, a library, theatre, and a monument (1888) to Smidt, the burgomaster of Bremen, to whose enterprise the harbour of Bremerhaven is due. Shipbuilding and kindred industries are carried on. A terrible explosion, caused by an infernal machine, took place on 11th December 1875. Though the miscreant, Thomas, who devised the outrage in order to recover the insurance for goods shipped on the liner *Mosel*, which was thus prematurely wrecked, himself escaped destruction, he committed suicide in his cabin. Population (1885), 14,900; (1895), 18,366; (1900), 20,322.

Brenham, capital of Washington county, Texas, U.S.A., situated in the south-eastern part of the state, at an altitude of 332 feet, on the Houston and Texas Central and the Gulf, Colorado, and Santa Fé railways. The neighbouring region is fertile and produces much cotton, for which Brenham is the compressing- and shipping-point. Population (1880), 4101; (1890), 5209; (1900), 5968.

Brentano, Ludwig Joseph [called LUJO] (1844—), German economist, a member of the family of the celebrated Clemens and Bettina Brentano, was born at Aschaffenburg, 18th December 1844. He received a portion of his academical education in Dublin, a circumstance almost unexampled in the history of a German author. In 1868 he visited England, and made a thorough study of trade-unionism, which resulted in his principal work, *Die Arbeitergilden der Gegenwart*, Leipzig, 1871-72. The book was assailed by Bamberger and other economists, but has proved epoch-making, not only as an authority on modern associations of workmen, but for having given an impetus to the study of the guilds of the Middle Ages, and the examination of the great stores of neglected information bearing upon the condition of the people in olden days. Brentano's other works are of a more theoretical character, and chiefly relate to political economy, of which

he has been professor at Breslau from 1872 to 1882, and at Strasburg since 1882. His work on guilds was translated into English by Miss Lucy Tomlinson Smith.

Brentford, a market town in the Brentford parliamentary division of Middlesex, England, 8 miles W. of St. Paul's, London, on the Brent, and the London and South-Western railway. Brentford has been the county town for elections since 1701. Population of town (an urban district) (1881), 11,810; (1901), 15,171.

Brescia, chief town of the province of the same name, in Northern Italy. Since 1875 considerable improvements have been effected. In the province alone 153 kilometres of new railways and 105 km. of steam tramways have been opened. The chief industries are woollen, cotton, and silk weaving; iron casting and gun making; hat and rope making. The stone quarries of Mazzano now yield between three and four thousand cubic metres per annum. The stone has been used for the monument to Victor Emmanuel II. at Rome, and for various buildings in Austria, England, Egypt, India, and America. The cement industry has also increased. Agriculture has been improved by draining marshy districts; cattle-raising and cheese-making have extended. In the city the communal palace (known as the Loggia), the old cathedral, and the old municipal palace, have been restored. The cathedral was reopened for public worship in 1897. Monuments have been erected since 1880 to Arnold of Brescia (by Tabacchi), to Garibaldi (by Eugenio Maccagnani), and to Bonvicino, called Moretto, by Ghidoni. The Museo Patrio having proved too small, the collections of Christian art have been transferred to the church of Santa Giulia, while the Museo itself has been reserved for Roman remains. By a legacy of Count Leopold Martinengo the municipal gallery has been installed in the Martinengo palace. The collection consists chiefly of 16th and 17th century Italian pictures, including important works by Moretto and Romanino. In 1899-1900 the water-supply was reorganized and a large reservoir is being constructed. The castle hill has been laid out as a public garden. The population of the town in 1900 was 70,618; of the province, 537,690. (L. BL.)

Breslau (Slav. *Vratislavia*), a town of Prussia, capital of Silesia, and an episcopal see, on the Oder, 204 miles S.E. of Berlin on the railway to Vienna. It is the fifth city in point of population in the empire, and the seat of important and growing industries, the chief branches of which are the manufacture of machinery, railway carriages, printing, leather and leather goods, distilleries, breweries, and furniture, cigars, ready-made clothing, and musical instrument factories. It is also the centre of a large trade in the products of the province, partly by rail, partly by river—wool, cereals, minerals, leather, machinery, horses, cattle, sugar, butter, and honey. In 1898 an aggregate of 7552 vessels of 2,305,300 tons entered and cleared by river. The growth and modern spirit of the city are exemplified in the large number of new buildings and monuments erected since 1876. Of these the most important are the provincial house of assembly; the provincial administrative offices (1883-86); the Breslau Bank of Exchange (1890); the savings bank (1891), in which are preserved the municipal library of 130,000 vols. and more than 3000 MSS., as well as the very valuable city archives; the post office (1888), in the Renaissance style; the Silesian Museum of the Industrial Arts and Antiquities, stored in the former assembly hall of the provincial estates, which has been rebuilt (1897-99) for the purpose; the Fine Arts Museum (1875-79), with collections of pictures, &c.; the chemical and anatomical institutes of the university; several new churches (St

Salvator, Luther, St Boniface, &c.), and a gaol. The chief Protestant church of St Elizabeth, which contains portraits of Luther and Melancthon by Lukas Cranach, was restored in 1891-93; the church of St Mary Magdalene (Protestant), of the same date as the church of St Elizabeth, was restored in 1887-90, after the destruction by fire of one of its twin towers in 1887; the town hall was restored in 1885-88. The city is especially rich in fine monuments, the more recent being the Emperor William I. (1896) by Behrens; a monument of the war of 1870-71; a marble statue of General Tauentzien by Langhans and Schadow; a bronze statue of Svarez, the Prussian jurist (1896); a monument of Schleiermacher (1869), who was born here in 1768; and monuments to the Emperor Frederick III. and Bismarck. Here, too, should be mentioned the handsome outlook tower on the Liebigshöhe (1867). Breslau is also the seat of numerous important educational institutions. First amongst these comes the university (1662 students and 169 professors in 1900). Its library contains 400,000 vols., and 4000 vols. of MSS.; also, an archaeological collection. Further, there are a Roman Catholic normal school, a Jewish theological seminary, eight classical and four modern schools, one of the last with technical divisions. This city is the headquarters of the 6th German Army Corps, and of the Silesian Society for Native (*vaterländische*) Civilization, and nearly fifty other learned literary and artistic societies. There are four theatres and three music halls. The course of the Old Oder, which circles round the town to the north-east, was regulated by canal works in 1897. Population (1885), 299,640; (1890), 335,186; (1900), 422,738.

(J. T. BE.)

Brest, chief town of arrondissement, department of Finistère, France, with terminal station on the railway from Paris. Orphan boys are trained as sailors, first in a marine school, and afterwards in one or other of the naval training-ships stationed here. Five lighthouses mark the entrance to the harbour. The industrial activities of the town depend mainly on the government dockyard and arsenal, which employ between 8000 and 9000 workmen. Chemicals and briquettes are manufactured, and there are ironworks. The total imports in 1899 were valued at £283,400, of which coal from England supplied one-fourth, other imports being wine, timber, coffee, and phosphates. The exports (of which strawberries form the bulk) are of small value, but go almost entirely to England. In 1898 a new direct submarine cable was laid between Brest and Cape Cod to the United States, and it has been proposed to organize a fast line of passenger ships between Brest and New York. Population (1881), 57,277; (1901), 84,284.

Breton, Cape, an island belonging to the province of Nova Scotia, on the N.E. of the mainland, from which it is separated by the Strait of Canso. The highest land in Nova Scotia is situated in the northern part of the island, where the surface rises to a height of 1500 feet. This area is occupied by pre-Cambrian rocks, which in places are overlaid by Carboniferous strata. In the south-west portion and around Bras d'Or lake there are similar pre-Cambrian areas with others in which Cambrian fossils are abundant. On the west coast between Margaree harbour and Port Hood, and on the south side of the island at Seacoal Bay and Little River, Richmond county, the Coal Measures occur with valuable seams of coal, while the Sydney coalfield occupies the east coast from Mira Bay to St Anns, some of the seams having been mined beneath the sea. The highest temperature at Sydney is 82° F. and the lowest -9°. Population (1881), 84,500; (1891), 86,854. In the latter year there were 4035 adherents of the Church of England, 47,913 of the

Church of Rome, 29,413 Presbyterians, 2546 Methodists, and 2435 Baptists. In 1900 there were 463 schools attended by 18,800 pupils. In the same year 2,200,000 tons of coal were produced. There were 102 vessels, 3522 boats, and 7422 men engaged in the fisheries in 1899. The total value of the fish and their products was \$1,300,410—the value of fishing vessels, boats, nets, lobster-canneries, &c., being \$524,755. In 1891 there were 1,184,426 acres of land occupied, 372,848 improved, 185,552 under crop, and 185,472 in pasture. Of wheat 8283 bushels were raised, 30,093 of barley, 313,556 of oats, 8129 of buckwheat, 1,041,292 of potatoes and other roots, and 112,271 tons of hay. There were 13,885 horses, 1286 oxen, 37,454 milch cows, 33,906 other horned cattle, 96,006 sheep, and 10,035 swine, and 1,888,248 lb of home-made butter were produced, 271,646 lb of cheese, and 285,021 lb of wool.

Breton, Jules Adolphe Aimé Louis (1827—), French painter, was born 1st May 1827, at Courrières, Pas de Calais, France. His artistic gifts being manifest at an early age, he was sent in 1843 to Ghent, to study under the historical painter de Vigne, and in 1846 to Baron Wappers at Antwerp. Finally he worked in Paris under Drolling. His first efforts were in historical subjects: "Saint Piat preaching in Gaul"; then, under the influence of the revolution of 1848, he represented "Misery and Despair." But Breton soon discovered that he was not born to be a historical painter, and he returned to the memories of nature and of the country which were impressed on him in early youth. In 1853 he exhibited the "Return of the Harvesters" at the Paris Salon, and the "Little Gleaner" at Brussels. Thenceforward he was essentially a painter of rustic life, especially in the province of Artois, which he quitted only three times for short excursions: in 1864 to Provence, and in 1865 and 1873 to Brittany, whence he derived some of his happiest studies of religious scenes. His numerous subjects may be divided generally into four classes: labour, rest, rural festivals, and religious festivals. Among his more important works may be named "Women Gleaning," and "The Day after St Sebastian's Day" (1855), which gained him a third-class medal; "Blessing the Fields" (1857), a second-class medal; "Erecting a Calvary" (1859), now in the Lille Gallery; "The Return of the Gleaners" (see Plate) (1859), now in the Luxembourg; "Evening," and "Women Weeding" (1861), a first-class medal; "Grandfather's Birthday" (1862); "The Close of Day" (1865); "Harvest" (1867); "Potato Gatherers" (1868); "A Pardon, Brittany" (1869); "The Fountain" (1872), medal of honour; "The Bonfires of St John" (1875); "Woman mending Nets" (1876), in the Douai Museum; "A Gleaner" (1877), Luxembourg; "Evening, Finistère" (1881); "The Song of the Lark" (1884); "The Last Sunbeam" (1885); "The Shepherd's Star" (1888); "The Call Home" (1889); "The Last Gleanings" (1895); "Gathering Poppies" (1897); "The Alarm Cry" (1899); "Twilight Glory" (1900). Breton was elected to the Institut in 1886 on the death of Baudry. In 1889 he was made Commander of the Legion of Honour, and 1899 Foreign Member of the Royal Academy of London. He has also written several books, among them *Les Champs et la Mer* (1876), *Nos Peintres du Siècle* (1900), and "Jeanne," a poem.

"THE RETURN OF THE GLEANERS." By JULES BRETON.

BREWING.

THE evolution of the brewing industry since 1875 has been accompanied by many interesting developments, important not only from an economical or trade point of view, but also in their technological and scientific aspects. The period covers the repeal of the malt tax and the introduction of the "free" mash-tun, and, as a consequence of the new law, the greatly increased use of malt substitutes and the rise of the "pure beer" agitation. It is a period which has seen the gradual modification of the character of British beers, the strongly alcoholic, heavily-hopped liquids consumed by the previous generation slowly giving place to the lighter beverage in vogue at the present time. It includes the classical researches of O'Sullivan, Brown, Heron, and Morris, on starch degradation, and those of Hansen, with their brilliant practical application, on the methods of obtaining and cultivating pure yeasts; and many important and innumerable minor improvements in the malting, mashing, refrigerating, and fermenting processes.

Repeal of the Malt Acts, and the Free Mash-tun.—By the Act of 1880 the duty was taken off the malt and placed on the beer, or, more properly speaking, on the wort, and the restrictions as to the use of materials in brewing were removed. The chief feature of Mr Gladstone's Bill was that on and after the 1st October 1880 a beer duty was imposed in lieu of the old malt tax, at the rate of 6s. 3d. per barrel of 36 gallons, at a specific gravity of 1·057; and the regulations for charging the duty were so framed as to leave the brewer practically unrestricted as to the description of malt or corn and sugar, or other description of saccharine substitutes (other than deleterious articles or drugs), which he might use in the manufacture or colouring of beer. This freedom in the choice of materials has continued down to the present time, except that the use of "saccharin" (a product of coal-tar) was prohibited in 1888, the reason being that this substance gives an apparent palate-fulness to beer equal to roughly 4° in excess of its real gravity, the revenue suffering thereby. In 1889 the duty on beer was increased by a reduction in the standard of gravity from 1·057 to 1·055, and in 1894 a further 6d. per barrel was added. The duty thus became 6s. 9d. per barrel, at a gravity of 1·055, which was further increased by 1s. a barrel by the war budget of 1900.

Prior to 1896 rice, flaked maize (see below), and other similar preparations had been classed as malt or corn in reference to their wort-producing powers, but after that date they were deemed sugar¹ in that regard. By the new Act (1880) 42 lb weight of corn, or 28 lb weight of sugar, was to be deemed the equivalent of a bushel of malt, and a brewer was expected by one of the modes of charge to have brewed at least a barrel (36 gallons) of worts (less 4 per cent. allowed for wastage) at the standard gravity for every two bushels of malt (or its equivalents) used by him in brewing; but where, owing to lack of skill or inferior machinery, a brewer cannot obtain the standard quantity of wort from the standard equivalent of material, the charge is made not on the wort, but directly on the material. By the new Act licences at the annual duty of £1 on brewers for sale, and of 6s. (subsequently modified by 44 Vict. c. 12, and 48 & 49 Vict. c. 5, &c., to 4s.) or 9s., as the case might be, on any other brewers, were required. The regulations dealing with the mashing operations are very stringent. Twenty-four hours at least before mashing, the brewer must enter in his brewing-book (provided by the Inland Revenue) the day and hour of commencing to mash malt, corn, &c., or to dissolve sugar; and the date of making such entry; and also, two hours at least before the notice hour for mashing, the quantity of malt, corn, &c., and

sugar to be used, and the day and hour when all the worts will be drawn off the grains in the mash-tun. The worts of each brewing must be collected within twelve hours of the commencement of the collection, and the brewer must within a given time enter in his book the quantity and gravity of the worts before fermentation, the number and name of the vessel, and the date of entry. The worts must remain in the same vessel undisturbed for twelve hours after being collected, unless previously taken account of by the officer. There are various other regulations, such as those prohibiting the mixing of worts of different brewings unless account has been taken of each separately, the alteration of the size or shape of any gauged vessel without notice, and so on.

FIG. 1.—Diagram showing the total production of Beer (barrels) in the United Kingdom, 1875-1900.

Commercial Development.—When the article in the ninth edition was written it was believed by competent experts that the brewing trade had attained its maximum extent, and for a series of years it appeared as though this belief was well founded. In the decade 1880-90 both the number of barrels brewed and the quantity of materials annually used were considerably below the figures for 1875; the barrelage remaining almost stationary at 27 to 28 millions, as against 31 millions at the latter date. Since 1891, however, there has been a steady increase, and with the exception of 1895 each year has marked an advance on the preceding one (Fig. 1). The following figures with regard to the barrelage, materials, duty, &c., need no explanation:—

United Kingdom.

Year.	Number of Barrels Produced.	Malt and Corn (Bushels).	Sugar and Equivalents (Cwts.).	Duty Paid (£).	Exports (Barrels).	Imports (Barrels).
1875	31,014,381	58,228,499	890,686	8,213,977	508,881	
1885	27,986,498	51,889,489	1,274,589	8,544,749	488,529	23,348
1891	31,927,308	55,698,528	2,025,658	9,781,398	569,702	
1899	36,498,204	58,681,112	4,031,290	12,085,822	485,082	49,188
1899						
1900	37,090,986	57,354,904	4,181,889	12,345,150	522,830	50,666

¹ Includes rice, &c.

² Exclusive of rice, &c.

¹ They were classified at 28 lb in 1896, but since 1897 the standard has been at the rate of 32 lb to the bushel.

Germany is now the greatest beer-producing nation, the

United Kingdom coming next, but the consumption per head is considerably greater in the United Kingdom (Fig. 2). The latest comparable figures with regard to the total production and consumption of the three great beer-producing countries, together with those for 1885, are as under:—

Country.	Total Production (Gallons).		Consumption per Head of Population (Gallons).	
	1899.	1885.	1899.	1885.
United Kingdom	1,346,558,000	993,759,000	32.7	27.1
German Empire.	1,529,000,000	932,228,000	27.5	19.8
United States	1,014,696,000	494,854,000	13.3	8.8

Large as the *per capita* (Fig. 3) consumption in the United Kingdom may seem, it is considerably less than is the case in Bavaria, which stands at the head of the list with 54.6 gallons, and in Belgium, which comes second with 46.9 gallons. In the city of Munich the consumption is actually

FIG. 2.—Diagram showing graphically the total production of Beer (gallons) in the United Kingdom and chief countries.

over 100 gallons, that is to say, more than 2 pints a day for every man, woman, and child. It is curious to note that in Germany, which is usually regarded as the beer-drinking country *par excellence*, the consumption per head of this article is less than in England, and that inversely the average German consumes more alcohol in the shape of spirits than does the inhabitant of the British islands (*consumption of spirits per head*: Germany, 1.85 gallons; United Kingdom, 1.03 gallons). In the British colonies beer is generally, as in the United Kingdom, the staple drink, but whereas in the United Kingdom 31 gallons are consumed annually per head of population, in Australasia the *per capita*

consumption amounts to only 10.6, in Canada to 3.6, and in Cape Colony to 1.6 gallons. In the latter colony, however, the staple drink appears to be spirits, which are consumed to the extent of 1.1 gallon per head of population. As in many other trades, a characteristic feature during recent years has been the absorption or disappearance of small firms and the corresponding growth of the larger breweries. In 1874 there were 34,000 brewers, in 1899 only 6739. At that time the largest brewer (Bass) produced 1,000,000 barrels, now Messrs Guinness (the largest brewers in the world) pay duty on considerably over 2,000,000 barrels. Two other breweries (Bass and Allsopp) produce between 1,000,000 and 2,000,000, and three others between 600,000 and 800,000 barrels. The present capital of Messrs Guinness amounts to £5,200,000, of Messrs Allsopp to £4,900,000, and of Messrs Bass to £3,280,000. In 1874 it was calculated that the capital invested in the liquor trade amounted to £117,000,000; in 1899 (according to Montgomery and Morgan) this had risen to £240,000,000. The number of persons employed is computed at not less than 2,000,000. According to Dr Burns, £162,000,000 were spent by the people of the United Kingdom on alcoholic liquors in 1899, or rather

more than £4 per head. The largest Continental breweries are: in Germany, the Schultheiss brewery (Berlin), 478,000 barrels; the Löwenbrau (Munich), 320,000 barrels; in Austria, Anton Dreher, 480,000 barrels.

Barley.—In common with other branches of agriculture, the cultivation of barley in the United Kingdom is apparently declining. The area under cultivation, which was 2,762,263 acres in 1876, had shrunk to 2,068,760 acres in 1898; in 1899 the acreage was 2,151,550. The total estimated quantity also shows a tendency to decrease, but this, apart from the acreage, is naturally dependent on the seasons. It was at a maximum in 1885, when 85,721,672 bushels were collected; the latest figures are 74,730,785 bushels. There are no official returns as to the quantity of home-grown barley used for malting purposes, but there is good reason for believing that, although not actually less than in 1875, it is relatively so. The best English malting barleys are quite on a level with, and perhaps superior to, the foreign grain of a similar class, and the average good foreign malting barley of the Chevalier type possesses no considerable advantage over the English varieties, except that, as a rule, it contains less moisture than the latter. Of late years, however, considerable quantities of six-rowed barley (*Hordeum hexastichum*) have been imported, principally from the Levant, and this type of barley possesses certain properties which commend it to the brewer, especially for the brewing of rapidly clarifying light ales. It possesses roughly 10 per cent. more husk than the ordinary run of English barley, and this permits of closer crushing simultaneously with better drainage of the "goods" in the mash-tun. Moreover, the Levantine and other barleys of this class are usually very well matured and "kindly," as they get plenty of sun, besides which beers brewed with their aid will clarify rapidly. Notwithstanding this, however, the importation of these barleys into the United Kingdom for malting purposes does not make such strides as at one time seemed probable, the chief reason being that the average quality of English malting barleys has tended to improve within the last few years. This is not solely due to the prevalence of favourable climatic conditions, but also to the fact that British farmers are beginning to take advantage of the great mass of practical and scientific research work relating to the cultivation of barley for malting purposes, which has been carried out within the last twenty years.

FIG. 3.—Diagram showing graphically Beer consumption (gallons) per head of population in the United Kingdom and chief countries.

It is gratifying to see that the labours of, among others, Lawes and Gilbert, Hellriegel, Maercker, Munro and Beavan, &c., are at last bearing fruit, and that the British farmer is beginning to appreciate them, and to apply their results. Nevertheless, there is still considerable room for improvement, and it is an undoubted fact that an appreciable proportion of the barley grown in the United Kingdom, which, owing to the "unkindly" condition of the starch and the unfavourable character of the nitrogenous matter,

is not suitable for malting purposes, is being sold as feed for cattle and horses, and is thus being wasted. It is a pity that the British farmer is not more generally aware of the value of his barley, and that he does not more generally apply the results of the researches of the agricultural chemists and the brewers. It is a pity that the British farmer is not more generally aware of the value of his barley, and that he does not more generally apply the results of the researches of the agricultural chemists and the brewers.

&c., cannot be employed for malting, could be used for that purpose if it were cultivated and malted on the lines indicated by modern experiments in the field, laboratory, and malt-house. Before the malt tax was repealed it was in the brewer's interest to use as heavy a malt as possible, but this is by no means the case nowadays. A heavily manured, highly nitrogenous barley is not suited for brewing light-gravity beers, but many barley-growers have not yet adapted themselves to the new conditions, and continue to produce an article which was suited to the requirements of the past generation of brewers, but is of little use at the present time. The following is a short summary of the views generally held nowadays with regard to the cultivation of malting barley:—

The Soil.—It was formerly held that only a rich, friable loam, or a loose sandy soil with a calcareous subsoil, was suitable for barley, but good crops can be grown on heavier soils provided the ground is well worked to provide a fine tilth, and that the drainage is satisfactory. The clearance of all weeds is a most important matter; it has been found that the crop may be reduced by as much as one-third by neglecting to pay proper attention to this point. With regard to *rotation*, it is considered that the most satisfactory malting barley is obtained by taking barley after wheat or other corn crop. The old Norfolk four-course rotation—roots, *barley*, clover (or beans), and wheat—is probably still adopted by nine farmers out of ten, but it is open to little doubt (Lawes and Gilbert, Munro and Beavan, &c.) that it is better not to grow barley after roots fed off by sheep, as this rotation leaves the land, even if it be of a light description, in too "high" a condition, and a steely, hypernitrogenous barley is likely to be produced. By taking barley as a second corn crop, the latter following roots fed off, or a "high" crop, not only is a better malting barley produced, but this arrangement will be found suitable for the farmer in many other respects. With regard to *manure*, it has been abundantly proved that an excess of nitrogenous manure is particularly undesirable, and that of all nitrogenous manures the ordinary farmyard variety is the least suitable for malting barley. Nitrogenous manure, preferably in the shape of nitrate of soda, should only be used very slightly (part as top dressing), and in conjunction with a sufficiency of phosphates and potash salts. The latter are not indicated to any extent except where the soil is relatively poor in potash, but phosphatic manure appears to be an essential. Excess of nitrogen tends to produce steely, unkindly barleys, which not only cause trouble in the mash-tun, but also retard the clarification of the beer. Excessive potash also tends to increase the nitrogen of the grain unduly. The *seed* should be carefully chosen, kiln-dried if necessary, and sown by mechanical means to ensure evenness, both as regards depth and spacing. Two to three inches is considered the most suitable depth for drilling. The barley should be allowed to become dead ripe before cutting, but directly the latter operation is completed, and the undergrowth dry and withered, the grain should be stacked at once. Before *stacking*, the grain and straw should be quite dry, as damp stacking leads to heating, discolouring, mould, and other evils. As soon as the stack has ceased sweating, the barley will be ready for threshing. Kiln-drying after threshing is strongly recommended, as it not only prevents the defects alluded to above, but also to a great extent supplies the want of sun in an unkindly barley. *Threshing* machines are apt to damage barley if unskilfully used, and damaged barley will give rise to mould on the floors, but if the machine is of the right type, is evenly fed, and provided with properly adjusted screens, the results should be excellent in every respect.

The following figures with regard to the importation of barley will be of interest in view of what has been said above. [*N.B.*—The figures apply to barley generally, and not only to malting barley]:—

I. *Average Annual Quantities of Barley imported into the United Kingdom in Triennial Periods since 1875.*

Period.	Quantity (Cwts.).	Value (£).
1875-77	11,261,000	4,593,000
1881-83	13,936,000	5,113,000
1887-89	17,649,000	4,932,000
1893-95	25,902,000	6,135,000
1897-99	20,201,694	5,474,226

II. *Approximate Percentage of Net Imports to Total Supply.*

Period.	Per Cent.	Period.	Per Cent.
1886-88	32·3	1893-95	44·0
1889-91	33·2	1897-99	44·0
1892-94	40·8		

III. *Percentage of Total Imports contributed by various Countries.*

Country.	1875-77.	1881-83.	1887-89.	1893-95.	1897-99.
Russia, per cent.	16·6	25·7	50·7	59·6	42·1
Turkey and Balkan States, per cent.	33·1	34·3	21·9	22·5	32·4
Other countries, per cent.	50·3	40·0	27·4	17·9	25·5

Malt and Malting.—The repeal of the Malt Acts not only gave a free hand to the brewer with regard to materials, but also removed the many irksome restrictions to which the maltster was subjected prior to 1880. The liberty thus accorded to the maltster, the tendency to apply scientific methods to industrial operations, and the riper knowledge of the true inwardness of the malting processes are the chief factors to which the modern mechanical improvements in malting may be ascribed. The machinery for cleaning and grading the grain, for instance, has been brought to a high state of perfection, and (more especially on the Continent of Europe) the old process of turning the malt on the kiln by hand has been, in many malt-houses, replaced by automatic stationary or travelling turning appliances actuated by clockwork or otherwise. The automatic regulation of heats and of the air-supply on the kiln by thermo-regulators, fans, and other contrivances is also a feature in modern malting.

Up to 1881 malt kilns in England were invariably constructed with a single drying floor, but in that year the first kiln with two floors (Stopes's system) was tried, and this modification of the older methods of working has given satisfactory results. The advantages of the double-kiln system are that it admits of great regularity of temperature on both floors, and effects considerable economy with regard to fuel and labour. Another novelty, which in a sense may be regarded as a corollary to the pneumatic (see below) system of malting, is Free's patent kiln, which is practically an air-tight chamber from which the moisture of the green malt can be rapidly removed by means of an air propeller fitted in the apex of the kiln. This arrangement considerably reduces the kilning time, and permits of materially greater depths of malt on the kiln without a corresponding increase of temperature. It is also possible to work at higher temperatures without affecting the colour of the malt as would be the case on an ordinary kiln.

The *pneumatic* system of malting, which has been developed since the article in the ninth edition was written, is worthy of notice. The principle of this is that the malt is grown, not on an open "floor" to which the air has free access, but in an enclosed space which is continuously provided with a fresh supply of air, the gases exhaled being simultaneously removed. Pneumatic malting may be briefly described as a system which permits of absolute control of temperature and the condition of the air-supply. The system devised by Mr Galland consists of a series of closed drums from which the air and evolved gases are exhausted by a suction pump or fan, which also draws in a continuous fresh supply of air, the latter being cooled and moistened by passing over a bed of coke which is sprayed with cold water. The drums revolve periodically or continuously, thus preventing the grain from growing together in a tangled mess. Apart from the advantages already mentioned, it is held by many authorities that the pneumatic system effects considerable economy as regards primary cost, space, labour, and other working expenses. Pneumatic malting, although extensively employed on the Continent and in America, has not, so far, attained the results that were anticipated of it in England, but the improvements which have been effected (more especially by Hemming) in this system are very marked, and it seems probable that in time it will find a wide application in Great Britain also.

The repeal of the Malt Acts has been responsible for at least one considerable modification in the process of malting, namely, the abandoning of the *couch*. It is true that some maltsters still make use of it, but there can be little doubt that the piling up of the freshly-steeped grain in heaps for any length of time is not only unnecessary but undesirable, as it leads to unevenness of growth on the floors. The conditions necessary for the treatment and modification of unkindly barleys, both as regards the starch and the nitrogenous matters, have formed the subject of many investigations, the results of which have largely added to the maltster's resources. These investigations can only be indicated here, but it may be sufficient to say that our knowledge of the influence of temperature (on the floors as well as on the kiln) of the merits of prolonged slow flooring as opposed to a more rapid (so-called "forced") growth, and of other kindred considerations, has been very considerably increased. It has been shown that the "forcing" process, which consists essentially in the employment of relatively high floor temperatures in order to accelerate rootlet growth, is liable to lead to unsatisfactory clarification—at any rate, when brewing on infusion lines—and that better results are obtained by prolonged flooring at lower temperatures. It also appears fairly certain that the *total quantity* of nitrogen in a barley or a malt is no criterion of its value, but that it is the condition of the nitrogenous matter which is of importance, and more particularly the proportion of coagulable to non-coagulable albuminoids (Morris, Kukla, &c.). The methods for controlling the value of a barley or malt in the laboratory have also been much elaborated, and it is now possible, within certain limits, to determine by a laboratory examination whether a barley or a malt is satisfactory or not, what the methods of treatment should be in the malt-house or the brewery, and so on. If the technical operations have made considerable advances it is to a great extent due to the fact that the objects to be attained and the processes taking place during malting are now much better understood.

The results of some of the more important modern investigations—in this connexion the work of Messrs O'Sullivan, and Brown and Morris must be specially mentioned—may be briefly summed up as follows. During the periods of steeping and germination there is in the first place formed a substance called *cytase*, the principal function of which is to break up or liquefy the envelope of cellulose with which each grain of the starch proper—the granule—in the barley corn is surrounded, and so to prepare the way for the action of the diastase. The latter is unable to act until this transformation of the cellulose sheath has taken place. *Cytase* is one of a class of bodies which were formerly called "ferments," but are now termed "enzymes" in order to distinguish them from living micro-organisms such as the yeasts and bacteria. The "enzymes" are unorganized (*i.e.*, without biological structure or life) products formed in the course of the metabolic processes exhibited by the living cell, and they possess a certain specific action or actions which they are able to exercise outside or independently of the organism by which they are produced. It is characteristic of these substances—and in this they are sharply differentiated from the ordinary chemical reagents—that the amount of work they can do (transforming, liquefying, saccharifying, &c.) stands in no definite relation to the quantity of the enzyme.

Messrs Brown and Morris have shown that immediately the germinating process in the barley corn begins, the embryo commences to secrete diastase, which diffuses into the endosperm and there quickly starts its attack on the cellulose (modified by the previous action of the *cytase*) and the starch immediately below the scutellum. This formation of diastase takes place principally, if not indeed entirely, in the epithelium, and is favoured by the presence of small quantities of acid, but restricted almost completely by readily assimilable carbohydrates (sugars). Thus, if barley be germinated in such a way that a sufficient quantity of cane sugar for the nourishment of the embryo is always present, no diastase is formed, and it is therefore probable that the diastatic secretion of the epithelium is an example of the starvation processes well known to botanists.

The action of diastase is twofold, liquefying and saccharifying; that is to say, it both makes the starch soluble in water and also

converts it into sugar. It is probable that there are at least three distinct enzymes contained in malt diastase; one liquefies starch, a second saccharifies the same, and a third (a peptonizing enzyme) is responsible for the modification of the nitrogenous matters. There is a certain quantity of saccharifying diastase in ungerminated barley, but it possesses no liquefying action. During the process of germination the proportion of this saccharifying diastase is enormously increased, and at the same time the liquefying enzyme is formed and stored for future use. Green malt ordinarily contains a large excess of diastase, especially of the saccharifying variety, and this in itself—apart from other reasons—makes its direct employment in the mash-tub impracticable, but it is necessary that it should contain a very large excess, as the kilning process destroys the diastatic activity of the green malt to a greater or lesser extent.

It is now known that the partial conversion of the insoluble albuminous substances into the soluble forms is one of the most important results of the malting process. An excess of insoluble albuminoids not only causes difficulties in clarification, but tends to promote the growth of undesirable micro-organisms in the finished beer. Hilger and van der Becker give the following figures as an example of the increase of the soluble albuminoids during malting:—

Percentage of Total Nitrogen.

Barley	6.74 per cent. of soluble nitrogen.
Steeped barley	8.75 " "
Green malt	21.96 " "
Cured "	24.44 " "

There is considerable divergence of opinion as to the nature of the soluble bodies formed, but they certainly appear to include coagulable proteids, albumoses, amides, amido-acids, and substances which, if they are not peptones proper, are at any rate very similar to the latter.

Considerable changes also take place during germination in regard to the disappearance of starch and the formation of sugar. The disappearance of starch varies from 4 to 20 per cent. Part of this is lost altogether in the shape of carbonic acid and water, a part is used for the formation of tissue, and the remainder is transformed into cane and other sugars (Brown and Morris, T. C. Day, Kjeldahl, O'Sullivan, &c.). At the same time there is a decrease in the percentage of fat and inorganic salts, but a considerable increase of acid—principally lactic acid.

Malt Substitutes.

Prior to the repeal of the Malt Acts the only substitute for malt allowed in the United Kingdom was sugar (Fig. 4). The quantity of the latter employed was 295,865 cwt. in 1870, 868,943 cwt. in 1875, and 1,136,434 cwt. in 1880—the last

FIG. 4.—Diagram showing graphically the total quantities (bushels) of (a) malt and corn and (b) malt substitutes used in brewing in the United Kingdom in the years 1875, 1885, 1891, 1899. (Malt substitutes at 28 lb to the bushel.)

year prior to the passing of the new Act. Since then the figures have shown a steady advance, reaching 2,025,658 cwt. in 1890, and 2,980,039 cwt. in 1900; that is to say, they have practically trebled within twenty years. At the same time other substitutes, such as unmalted corn and preparations of rice and maize, have come into favour, the quantity of these substances used being in 1899, 218,889 bushels of unmalted corn, and 1,087,538 cwt. of rice, maize, &c. These figures appear all the more striking when it is stated that the quantity of malt converted into beer has not increased since 1878. The following statistics with regard to the use of malt substitutes in the United Kingdom are not without interest:—

Year.	Quantities of Malt and Corn used in Brewing. (Bushels.)	Quantities of Sugar, Rice, Maize, &c., used in Brewing. (Bushels.)	Percentage of Substitutes used to Total Material.
1878	59,388,905	3,825,148	6.05
1883	51,331,451 ¹	4,503,680 ²	8.06
1890	55,359,964 ¹	7,904,708 ²	12.48
1895	53,731,177	10,754,510	16.66
1900	57,354,904	16,727,536	22.56

¹ Inclusive of rice and maize.² Exclusive of rice and maize.

If we take into account the fact that roughly 8,000,000 bushels of malt are used by brewers who do not employ substitutes, the net amount of sugar and its equivalents used in beer brewed with malt adjuncts was in 1900 somewhat over 25 per cent. on the total material. Some brewers have used as much as 60 to 70 per cent. of sugar, but these cases may be regarded as exceptional. With regard to the nature of the substitutes for barley malt more generally employed, *raw grain* (unmalted barley, wheat, rice, maize, &c.) is not used extensively in Great Britain, but in America brewers employ as much as 50 per cent., and even more, of maize, rice, or similar materials. The use of such a high proportion of these materials makes it necessary to work with malts made from coarse-skinned, highly diastatic barleys, in order to ensure efficient drainage and conversion of the goods in the mash-tun. The maize, rice, or other grain is usually gelatinized in a vessel entirely separated from the mash-tun—termed a “converter”—by means of steam at about 200° F., mostly with, but occasionally without, the addition of a little malt meal. After about half an hour the gelatinized mass is mixed with the main mash, and this takes place shortly before taps are set. This is possible inasmuch as the starch, being already in a highly disintegrated condition, is very rapidly converted. By working on the limited decoction system (see below) it is possible to make use of a fair percentage of raw grain in the mash-tun proper, thus doing away with the “converter” entirely. The maize and rice preparations mostly used here are practically starch pure and simple, substantially the whole of the oil, water, and other subsidiary constituents of the grain being removed. The germ of maize contains a considerable proportion of a very objectionable oil, which has to be eliminated before this material is fit for use in the mash-tun. After de-germing, the maize is unhusked, wetted, submitted to a temperature sufficient to rupture the starch cells, dried, and finally rolled out in a flaky condition. Rice is similarly treated.

The *sugars* used are chiefly cane sugar, glucose, and “invert” sugar—the latter commonly known to brewers as “saccharum”—in approximately equal quantities. Cane sugar is mostly used for the preparation of heavy mild ales and stout, as it gives a peculiarly sweet and full flavour to the beer, to which, no doubt, the popularity of this class of beverage is largely due. *Invert sugar* (the ordinary method of preparation) is still substantially the same as that described in the ninth edition. Of late years it has become the practice among many brewers to prepare their own invert sugar, either by the ordinary acid process, or by the method introduced by Tompson, which makes use of the inverting power of one of the enzymes (invertase) contained in ordinary yeast. The cane-sugar solution is pitched with yeast at about 55° C., and at this comparatively high temperature the inversion proceeds very rapidly, and fermentation is practically impossible. When this operation is completed, the whole liquid (including the yeast) is run into the boiling contents of the copper. The chemical equation representing the conversion (or inversion) of cane sugar is:—

Invert sugar is so called because the dextro-rotation (of the plane of a ray of polarized light) of the original cane sugar is changed or inverted by the action of acid or invertase, the resultant mixture being *laevo-rotatory*. Invert sugar is *laevo-rotatory* because the rotation due to the *laevo-rotatory* fructose is greater than that caused by the *dextro-rotatory* glucose.

Glucose, which is one of the constituents of invert sugar, is largely used by itself in brewing. It is, however, never prepared from invert sugar for this purpose, but directly from starch by means of acid. By the action of dilute boiling acid on starch the latter is rapidly converted first into a mixture of dextrin and maltose and then into glucose. The proportions of glucose, dextrin, and maltose present in a commercial glucose depend very much on the duration of the boiling, the strength of the acid, and the extent of the pressure at which the starch is converted. In England the materials from which glucose is manufactured are generally purified maize, sago, and rice. In Germany potatoes (potato starch) form the most common raw material, and in America purified Indian corn (maize) is ordinarily employed.

The causes which have led to the largely increased use of substitutes in the United Kingdom are of a somewhat complex nature. The brewer has found, to begin with, that the brewing operations are simplified and accelerated by the use of a certain proportion of sugar, and that he is thereby enabled appreciably to increase his turnover—i.e., he can make more beer in a given time from the same plant. Moreover, with the exception, perhaps, of the very finest class of brewing sugar, substitutes are cheaper than malt. In view of the ever-growing competition in the brewing trade, due largely to the development of the “tied house” system and the steady increase of taxation, this is a matter of considerable economical importance. Having regard to the enormous consumption of beer in the United Kingdom, it is obvious that the extensive use of malt substitutes in brewing is a question of interest not only to the brewer and agriculturist, but also to the general public. Beer is not, perhaps, a food in the ordinary sense of the word, but it possesses a certain food value, and the consumption is so great that its albuminous and carbohydrate constituents form an appreciable percentage of the total proteid and carbohydrate food of the nation. Shortly after the repeal of the Malt Acts a serious agitation against the unrestricted and undeclared use of malt substitutes was started by an influential section of the community. This movement attained such dimensions that the Chancellor of the Exchequer appointed a Departmental Committee to consider the whole question. The Beer Materials Committee, as it was called, sat during 1896-98, and the arguments on the main points of controversy are shortly set forth in the following summary:—

The advocates of “pure beer” (the anti-substitute party) pleaded:—

(1) That by the use of substitutes, more especially of sugar, an article is produced which is materially different from the product obtained from barley malt alone; that the consumer desires to have an “all-malt” beer, and that it is deceiving the latter to sell him an article which is not of the “nature, substance, and quality” desired. The consumer has (owing to the “tied house” system) in many cases no choice but to drink the beer offered him, and is therefore practically not a free agent.

(2) That *ceteris paribus* a beer brewed with a proportion of sugar contains proportionally less nutritive matter—less extract and less of the valuable by-products which are the chief characteristics of beer—as compared with other spirituous liquors.

(3) That foreign substances are introduced into beer by means of substitutes, as these are in many cases not pure. Some of these

foreign matters (for instance the unfermentable residue of potato glucose) have been held by authorities to be deleterious to health; but in any case, by giving an unlimited choice of materials to the brewer, the latter may—no doubt unintentionally—introduce into beer substances which are harmful (see ADULTERATION).

(4) That long experience both in the United Kingdom and abroad has shown that beer brewed from malt alone has important dietetic properties, and that this experience is lacking in the case of substitute beers. That even if it be correct to estimate food value by direct analysis, "substitute" beers contain less food and more alcohol than "all-malt" beers.

(5) That the use of substitutes is not necessary, as many of the most important brewers (including the largest firms in the United Kingdom) use practically none, and that, if it be a fact that, in order to meet the modern demand for light sparkling beers, it is necessary to use a corrective for the excess of nitrogenous matter in much of the English barley, there is no reason why foreign barley should not be used.

(6) That although it is (with certain exceptions) admitted to be an impossibility to detect the use of substitutes by analysis, there is no doubt that science would find the means to overcome this difficulty.

In answer to these arguments it was urged by those defending the use of substitutes:—

(1) That it is possible by modifying the curing, mashing, and fermenting processes to bring about greater changes in the character and composition of a beer than by the moderate and rational use of substitutes. It is denied that the consumer expects to obtain an "all-malt" article when he asks for "beer," nor does he care provided that his palate is suited. That since the repeal of the Malt Acts it has been *legal* for the brewer to use whatever material he desires, but sugar was used, and in considerable quantities, for many years prior to 1880. That the consumer is not forced to drink any particular brew. That if two beers be brewed from the same malt, and on identical lines, but replacing, say, 25 per cent. of the latter by sugar in the one instance, the difference in food value will be infinitesimal—roughly a quarter of an ounce to the pint—and that even if this system of estimating food value be incorrect, there is nothing to prove that the beer brewed with a well-prepared substitute is not, from a dietetic point of view, of equal value to the "all-malt" article.

(2) That the small quantities of so-called foreign substances or impurities contained in properly prepared substitutes are in no way harmful, and, with regard to the questionable nature of potato glucose, there is much experimental evidence tending to prove that it is harmless. That practically none of this glucose is used for brewing in England, and that the use of any harmful ingredient is punishable by the existing laws, and the fact of its being employed could not fail to come to the notice of the Revenue officials.

(3) That the great and increasing demand of modern times for a light and sparkling beer renders the use either of substitutes or of foreign barley a necessity.

(4) That it would be impracticable to enforce a declaration of the use of substitutes, as it is impossible to discover by analysis whether a beer is "all-malt" or not.

(5) That it is not the fact that substitutes are used because they are cheaper than malt; the better class of substitutes are relatively expensive.

The majority of the Committee reported in favour of the existing laws, substantially declaring that there is no reason either for prohibiting the use or for enforcing the declaration of substitutes. A minority report, signed by one of the six members, advocated declaration and closer control of materials, and held that the majority of the points advanced by the "pure beer" party had been proved.

Germany.—In Bavaria the use of all substitutes is absolutely prohibited, the only substances which may be used in brewing being malt, hops, yeast, and water. In the German Brewing Tariff Union (comprising the whole of the German Empire with the exception of Bavaria, Baden, and Württemberg) brewers are not restricted with regard to materials, except by the general laws relating to the composition of food stuffs injurious to health. It is a curious fact, however, that the North German Brewers' Union has frequently petitioned Government for restrictive legislation directed against the use of all substitutes, on the ground that the general consumer has more faith in Bavarian beer, knowing it to be made from malt and hops alone, and that such legislation would tend to improve the position of the brewers in the Brewing Tariff Union with regard to Bavarian competition. The quantity of substitutes used within the Tariff Union is small, both actually and in relation to the malt employed, when compared with the figures for the United Kingdom (see above, p. 326). The following table gives the statistics concerning the materials used in the Tariff Union for the financial year 1898-99.

Materials.	Quantities (100 Kilos.).	Percentage on Total Material.
Malt and grain	Barley malt . . . 7,444,983 Wheat malt . . . 194,719 Other grain . . . 4,664	95.4 2.4 0.1
Total grain	7,644,366	97.9
Substitutes proper	Rice . . . 102,254 Sugar . . . 36,709 Syrup . . . 1,584 Other substances . . . 17,009	1.3 0.8
Total substitutes	157,556	2.1

The gross percentage of substitutes (including grain other than barley malt) is therefore less than 5 per cent., and of substitutes proper—rice, sugar, &c.—barely 2 per cent.

Taking the whole of Germany the gross quantity of all barley malt substitutes used amounts roughly to 1½ per cent.

United States.—No restriction is placed by law upon the kind, quantity, or quality of the materials employed. The materials commonly used are malt and hops, but a variety of substitutes for malt is in use to a greater or less extent, and usually in combination with malt. The substitutes chiefly employed are rice, corn (maize), cerealine, glucose, and maltose. The American official returns do not lend themselves to an exact calculation of the percentage of malt substitutes employed at an English equivalent, but the figures show that the ratio of barley malt to substitutes is approximately as two to one. Of the substance chiefly used, rice and other grain constitute about one-half, sugar one-seventh, the remainder consisting of materials which are not separately specified.

In *Austria* there is no restriction as to materials, but substitutes are very little employed, probably because they are more expensive in that country than the natural products which they are designed to replace.

In *Belgium* the grain substitutes form roughly 9 per cent. of the total material; sugar may be used, but the nature and weight, &c., must be specified.

In *Holland* there are no restrictions, but substitutes are little used, probably four-fifths of the beer being brewed from grain alone.

Preservatives.—These are very generally, in fact almost universally, employed nowadays for light draught ales; to a lesser extent for stock ales. The light beers in vogue to-day are less alcoholic, more lightly hopped, and more quickly brewed than the beers of the last generation, and in this respect are somewhat less stable and more likely to deteriorate than the latter were. The preservative in part replaces the alcohol and the hop extract, and shortens the brewing time. The preservatives mostly used are the bisulphites of lime and potash, and these, when employed in small quantities, are generally held to be harmless.

Hops.—The acreage under hops in the United Kingdom has varied considerably since 1875, but on the whole is decreasing. At the date mentioned hops were grown on 69,171 acres; in 1885 this area had risen to the maximum figure noted during the last fifty years—71,327 acres—but since then the average has been considerably lower, amounting between 1896 and 1900 roughly to 50,000 acres a year. Very considerable quantities of foreign hops are now used in the United Kingdom, and according to Messrs Briant and Meacham, the explanation of the preference for American and Continental hops by many brewers is that they improve the keeping properties of the beer. This is due to the fact that foreign hops contain rather more of the soft hop resins—to which the main preservative effect of the hop is due—than many of the English samples. The authorities mentioned above (*Journal of the Royal Agricultural Society*, 1897) point out that English methods of growing, drying, and packing are in many cases faulty, and that by improving these methods the quantity and quality of the soft hop resin can be appreciably improved.

Hop substitutes are very little used. They mostly consist of quassia, gentian, and camomile, and these substances

are quite harmless *per se*, but impart an unpleasantly rough and bitter taste to the beer.

Mashing.—The writer has already alluded to and attempted to give reasons for the fact that in recent times the trend of brewing has been in the direction of light, bright beers, and there is no doubt that in many respects the modern product is preferable to the highly alcoholic, heavily-hopped beers of the bygone generation. When this class of beer is well and cleanly brewed from good material and the fermentation has proceeded on satisfactory lines, it is not only more palatable and slightly, but also less intoxicating and more easily digestible than the beer consumed by our predecessors. Although the imports of foreign beer into the United Kingdom are still infinitesimal compared with the total quantity consumed, it seems that the British taste for beer brewed on the German principle or some modification thereof is steadily growing. Within the most recent times the laying down of a lager beer plant by Messrs Allsopp, capable of turning out 50,000 barrels yearly—i.e., a liquid quantity practically equal to the total imports of foreign beer—has created a very widespread interest. The ordinary German beer—commonly called “Lager” in Great Britain (the German name for it is *Export Bier*, the term *Lager* being reserved for a somewhat different class of brew)—is produced on totally different lines from English beer. The latter is brewed by a process of *infusion*, the former according to the *decoction system*, so called because portions of the mash are treated separately from the whole.

The method pursued in the decoction system is as follows:—After the grist has been mashed with cold water until a homogeneous mixture ensues, sufficient hot water is introduced into the mash-tun to raise the temperature to 85°-100° F. according to circumstances. Thereupon roughly one-third of the mash (including the “goods”) is transferred to the *maisch Kessel* (mash copper) in which it is gradually brought to a temperature of (about) 166° F., and this heat is maintained until the mash, which at first presents a milky appearance, becomes transparent—a sign that the starch is completely converted. The *Dickmaische*, as this portion is called, is then raised to the boiling-point and the ebullition sustained between a quarter and three-quarters of an hour. Just sufficient of the *Dickmaische* is returned to the mash-tun proper to raise the temperature of the whole to 110°-125° F., and after a few minutes a third is again withdrawn and treated as before, to form the second *Dickmaische*. When the latter has been returned to the mash-tun the whole is thoroughly worked up, allowed to stand in order that the solids may deposit, and then another third, which is now, however, practically a clear wort (called the *Lautermaische*), is withdrawn, boiled by itself until the coagulable albuminoids are thoroughly precipitated, and finally reconveyed to the mash-tun, where the mashing is continued for some time, the final heat being rather over 160° F. (See under “Fermentation.”) As to the relative character and stability of decoction and infusion beers, the latter are, as a rule, more alcoholic; but the former contain more unfermented malt extract, and are therefore, broadly speaking, more nutritive.

Beers of the German type are also less heavily hopped and more peptonized than English beers, and more highly charged with carbonic acid, which, owing to the low fermentation and storing temperatures, is retained for a comparatively long time, and keeps the beer in condition. On the other hand infusion beers are of a more stable and stimulating character. It is impossible to keep “lager” beer on draught in the ordinary sense of the term in England. It will not keep unless placed on ice, and, as a matter of fact, the “condition” of lager is dependent to a far greater extent on the methods of dis-

tribution and storing than is the case with infusion beers. If a cask is opened it must be rapidly consumed; indeed, it becomes undrinkable within a very few hours. The gas escapes rapidly when the pressure is released, the temperature rises, and the beer becomes flat and mawkish. In Germany every publican is bound to have an efficient supply of ice, the latter frequently delivered by the brewery together with the beer. The following comparative analysis may give the reader some idea of the difference in composition of various Continental and English beers:—

Beer.		Total Solids (Extract) per Cent.	Alcohol per Cent.	Original Gravity of Wort.
English Beers	Stout . . .	5.27	6.11	1.0648
	Pale Ale . .	4.32	5.58	1.0579
	Light Bitter .	3.96	3.34	1.0394
	Mild Ale . .	5.81	4.54	1.0554
German &c. Beers	Munich Lager .	6.95	3.43	1.0523
	Munich Export	7.48	4.15	1.0595
	Pilsener . .	4.48	3.39	1.0416

It was formerly believed that by the mashing process the starch of the malt is first converted into dextrin, and that a part of the latter is then transformed into glucose; but modern investigations have shown that the diastatic degradation of starch is by no means so simple a matter. In the first place we now know that the final product obtained from starch under brewing conditions is not glucose, but maltose. It is held by some authorities that the latter is split up into glucose prior to fermentation; but this is certainly not the case in the mash-tun. Although not yet universally accepted, the theory of starch degradation propounded by Messrs Brown and Morris, usually known as the *amyloïn* or *malto-dextrin* theory, and which is based on a great mass of experimental evidence, is of considerable interest, and not only offers a rational and consistent explanation of the phenomena known to accompany the transformation of starch by diastase, but has proved itself to be a practical working hypothesis by which the mashing and fermenting operations may be regulated and controlled. According to Messrs Brown and Morris, the starch molecule consists of five amylin groups, each of which corresponds to the molecular formula $(C_{12}H_{20}O_{10})_{20}$. Four of these amylin radicles are grouped centrally round the fifth thus:—

By the action of diastase this complex molecule is split up, undergoing hydrolysis into four groups of amyloïns, the fifth or central amylin group remaining unchanged (and under brewing conditions unchangeable), forming the substance known as *stable dextrin*. The following equation explains the primary transformation:—

The amyloïns are substances containing varying numbers of amylin (original starch or dextrin) groups in conjunction with a proportional number of maltose radicles. They are not separable into maltose and dextrin by any of the ordinary means, but exhibit the properties of both these substances.

As the process of hydrolysis and degradation proceeds the amyloïns become gradually poorer in amylin and relatively richer in maltose groups, the final product of transformation being maltose. The progress of the transformation of the four convertible amylin groups into malto-dextrins, first of a high and then of a lower type, and finally into maltose, is accompanied by characteristic changes in the physical and chemical properties of the products of hydrolysis. The “opticity”—that is, the power of rotating a ray of polarized light—gradually diminishes, and, inversely, the cupric reduction, by which is denoted the capacity for reducing an alkaline solution of tartrate of copper (Fehling’s solution), increases. Messrs Brown and Morris have shown that there is a direct relationship between the opticity and the cupric reduction exercised by the mixed products of starch conversion, and also of any fraction of those mixed products. This relationship is so exact that if either the opticity or the cupric reduction of a solution of starch conversion products of a known density is observed, the other factor can be obtained by calculation. In the

light of our modern knowledge of starch conversion, determinations of the optical properties and the cupric reduction of a wort or of a beer, and of the behaviour of the same towards malt extract and yeast, &c., constitute valuable subsidiary methods for controlling and regulating the brewing operations. Several amyloins of definite composition have been isolated, one being amylo-dextrin ($C_{12}H_{20}O_{10}$)₈ ($C_{12}H_{22}O_{11}$), and another malto-dextrin ($C_{12}H_{20}O_{10}$)₂ ($C_{12}H_{22}O_{11}$). The first is an amyloin of a "high," the second an amyloin of a "low" type. The amyloins are not split up in the primary fermentation, but are converted into maltose more or less rapidly, according to their type, during the secondary fermentation. If it is desired to obtain a beer of a stable character—that is to say, one containing a considerable proportion of high-type amyloins—it is necessary to restrict the action of the diastase in the mash-tub accordingly. On the other hand, for mild running ales, which are to "condition" rapidly, it is necessary to provide for the presence of sufficient malto-dextrin of a low type. Investigation has shown that the type of malto-dextrin can be regulated not only in the mash-tub, but also on the malt-kiln. A higher type is obtained by low kiln and high mashing temperatures than by high kiln and low mashing heats, and it is therefore possible to regulate on scientific lines, not only the quantity, but also the type of amyloins which are suitable for a particular beer.

Cooling.—The introduction of refrigerators led many brewers to believe that it would be possible to do without the cooler altogether, but experience has shown that this was a fallacious conclusion. It is true that the exposure of hot wort on the cooler is attended with many dangers; but it is now known—thanks chiefly to Pasteur—that the oxygen necessary for the conversion of the hop-resins and other substances into insoluble modifications—that is to say, the *chemically bound* oxygen—can only be absorbed at a relatively high temperature. Beers which have not undergone a thorough hot aeration are liable to be of an unsatisfactory character, owing to the incomplete or tardy precipitation of the hop-resin, &c., in cask. In order, on the other hand, to overcome the dangers attendant on hot aeration, the greatest care must be taken with regard to the purity of the air-supply in the cooling-rooms. With regard to the refrigerator, the wort flows over it in a thin stream, and is, if anything, more exposed to infection during this process than on the cooler. Enclosed refrigerators with a purified air-supply are now being introduced into some breweries, and there is little doubt that this principle will in time be applied to the cooler also.

Fermentation.—The study of the phenomena connected with the process of fermentation, and more particularly of those associated with brewing, has led to discoveries of epoch-making importance, both from a theoretical and practical point of view. Up till 1897 Pasteur's theory of fermentation, according to which this process is indissolubly connected with the living cell, and the products of the fermentation of a saccharine liquid are actual products of yeast metabolism, was almost universally accepted as correct, the evidence in its favour being apparently overwhelming. The discovery in 1897 by Buchner that it is possible to obtain from brewing yeast an unorganized substance, which rapidly converts sugar into alcohol, carbonic acid, &c., outside of and quite apart from the living cell, has necessarily led to some modification of our views. According to Buchner, the substance in question is an enzyme to which he gave the name *zymase*. It may be obtained by grinding up yeast with quartz sand, then subjecting the mass of disintegrated yeast cells so obtained to great pressure, and finally passing the resultant liquid through a filter of the porous porcelain type. By evaporating this liquid at a low temperature the *zymase* can be obtained in the solid state, and may be kept for a considerable time without losing its property of causing fermentation.

The cause of the activity of the yeast-cell juice has given rise to considerable controversy, and it is contended by some (Ahrens, Macfadyen and Morris, &c.) that it is not due to an enzyme but to particles of living protoplasm. So far, however, the balance of evidence appears to be in favour of Buchner's enzyme theory, and

the fact remains that fermentation can be produced without the presence of yeast cells.

The brilliant researches of the Danish chemist and botanist Hansen, which we will next consider, not only mark a new era in our knowledge of the yeasts, but have probably had a greater influence on the fermentation—and especially the brewing—industries than the work of any other man, excepting, no doubt, that of Pasteur. Hansen recognized the fact that it was impossible to study the life action and functions of micro-organisms, more particularly of the yeasts, without first obtaining these in a pure—that is, an unmixed or uncontaminated—state. The "pure culture" yeast of Pasteur (see under "Fermentation," vol. ix. ninth edition) was not a pure culture in the true sense, as no certainty existed that the yeast obtained by Pasteur's method did not contain more than one type of organism. Hansen perceived that in order to obtain a really pure culture—that is to say, a culture containing only one particular variety—it was necessary to start from a single cell. He successfully attained this object by two methods—first, by the *dilution method*, so called because a drop of liquid, the approximate number of organisms in which is known, is diluted to such an extent that the average drop of the dilute liquid contains less than one cell; and secondly, by a modification of Koch's plate method, by which each cell, after the distribution of a small number amongst a suitable medium, is kept under microscopic observation during the whole of its development into a colony. By examining ordinary brewing yeast by these methods Hansen discovered that it consists of a number of different species and varieties, some of which are not favourable to the formation of a good beer, and it was found that not only bacteria and the so-called "disease-ferments" (Pasteur, &c.), but also certain types of yeast proper possess various undesirable properties from the brewer's point of view. Hansen showed that although different species and varieties of the same species may appear identical under the microscope, they may possess properties of a widely divergent nature, and that by virtue of those properties they may be differentiated. The chief types occurring in ordinary brewing yeast are—(1) The various varieties of *Saccharomyces cerevisiæ*; (2) *Sacch. Pastor* I., II., and III.; and (3) *Sacch. ellipsoideus* I., II., and III. Of these the *S. cerevisiæ* varieties are the true brewing yeasts. *S. Pastor* I. gives a bitter taste to the beer; *S. Pastor* III. and *S. ellips.* I. produce no particular ill effects, but are not characteristic beer yeasts; the latter being in fact the most common species among the grape yeasts.

Application of Hansen's Discoveries to Brewing.—In 1883 Hansen described a method by which he overcame a persistent tendency of the beers brewed at the Tuborg brewery near Copenhagen to become turbid. This he effected by introducing a pure yeast grown from a single cell. At the same time the Old Carlsberg brewery was afflicted in that its beer displayed a disagreeably bitter taste. Hansen examined the yeast in use there and discovered that it consisted of four varieties, and by experiment he found that only one of these gave a satisfactory beer; a pure culture of this was then tried in the brewery with excellent results, and has been in use there ever since. This is the yeast which is now known as Carlsberg bottom-yeast I. The advantages attendant on the use of pure yeast consist in the fact that it is possible to select the yeast which is best suited to the character of the beer which it is desired to brew, and that by always working with the same yeast it is possible to be absolutely certain of the results—that is to say, flavour, attenuation, stability, and so on, will remain constant.

In Denmark, Norway, and Sweden the practice of brewing with pure yeast is wellnigh universal; it has also been adopted in most of the chief breweries in Germany and Holland, and in many cases in America. Hansen's method has not yet made much headway in England, but it seems probable that in the course of time it will find favour there, but no doubt in a somewhat modified form. The chief difficulty so far is that the conditions under which English beer is fermented are quite unlike those obtaining for beer brewed on decoction lines, and also the radically different characters of the two classes of beer. In the English *top-fermentation* system the wort is pitched and fermented at a relatively high temperature—55°–65° F., sometimes higher. The fermenting vessels are of enormous size, and therefore present a large surface

to the air. The system is called *top-fermentation*, because the type of yeast employed develops on the surface of the liquid, forming the "head." The primary fermentation proceeds rapidly, and is usually complete in two to three days, and in the case of running ales the secondary fermentation is over within a fortnight, or even less. In the Continental *bottom-fermentation* system, the pitching and fermentation take place at a very low temperature (and in relatively small vessels), the cellars being maintained at a temperature of approximately 37°-38° F. The yeast formed in the fermenting wort, the temperature of which rarely rises above 50° F., reposes at the bottom of the fermenting tun, and hence is derived the name of bottom-fermentation. After eleven or twelve days the primary fermentation is complete, and the beer is then run into store (lager) casks where it remains at a temperature approaching the freezing-point of water for six weeks to six months, or even more, according to the time of the year and the class of beer that is being brewed. To put the matter briefly, these are conditions eminently suitable for the employment of pure yeast and the maintenance of it in an uncontaminated state, whereas the high temperatures, the surface exposure of the yeast and so on, which are essential factors of the English system, tend to cause a rapid deterioration of the pure yeast originally used. It is also more or less generally held that there is no single type of yeast which will produce English beer with all its characteristics, but that the latter are due to the joint action of at least two or three varieties or species. It has been stated that satisfactory results have been obtained in English breweries by the use of mixed pure cultures, which fact is not without interest, inasmuch as it is a general rule that one type of yeast (and this applies to micro-organisms generally) tends to predominate in a given liquid at a certain temperature. Cases are known, it is true, where several micro-organisms are essential to the production of a certain substance. This form of multifold existence is termed "symbiosis." Thus for the process of fermentation which results in ginger beer, two organisms are necessary—the one a yeast, the other a mould.

The process of lager beer brewing introduced by Messrs Allsopp into the United Kingdom exhibits many features of interest, as it combines infusion mashing with fermentation on decoction lines, and also embodies a new principle, that of vacuum fermentation, and many of the latest improvements in brewing technology. This process, which is used fairly widely in America, and has even taken a footing in Germany, is the Pfaudler vacuum fermentation process, of which the following is a brief description:—The wort is prepared on the ordinary infusion lines, and is then rapidly cooled by means of refrigerated brine before passing to a temporary store tank, which serves as a gauging vessel. From the latter the wort passes directly to the fermenting tuns, huge closed cylindrical vessels made of sheet-steel and coated with glass-enamel. Here the wort ferments under reduced pressure, the carbonic acid generated being removed by means of a vacuum pump, and the gas thus withdrawn is replaced by the introduction of cool sterilized air. The fermenting cellars are kept at a temperature of 40° F. all the year round, but the fermenting liquid, which shows 45° Fahr. at the commencement, gradually rises to a final temperature of about 53° F. The yeast employed is a pure culture bottom-yeast, but the withdrawal of the products of yeast metabolism and the constant supply of pure fresh air cause the fermentation to proceed far more rapidly than is the case with lager beer brewed on ordinary lines; it is, in fact, finished in about six days. Thereupon the air

supply is cut off, the green beer cooled by means of refrigerated brine to 40° F. and then conveyed by means of filtered air pressure to the store tanks. Here the secondary fermentation which takes three weeks proceeds at a low temperature (about 33° F.), but the gases of fermentation are now not removed, but, on the contrary, allowed to collect under pressure, so that the beer may be thoroughly charged with the carbonic acid necessary to give it condition, and in order to replace the gas withdrawn during the primary fermentation. When the secondary fermentation is completed (the attenuation being 68-70 per cent.) the beer is quite bright, but in order to make sure of its being perfectly free of yeast cells, &c., it is passed through a refrigerator and then through a filter, before going to the racking or bottling rooms, as the case may be. The beer is racked and bottled under counter pressure, so that none of the gas of the secondary fermentation can escape; indeed, from the time the wort leaves the copper to the moment when it is bottled in the shape of beer it does not come into contact with the outer air. (P. S.)

Brialmont, Henri Alexis (1821—), Belgian general and military engineer, son of General Laurent Mathieu Brialmont (d. 1885), was born at Venloo in Limburg on 25th May 1821. Educated at the Brussels military school, he entered the army as sub-lieutenant of engineers in 1843, and was employed on the defences of Diest. From 1847 to 1850 he was private secretary to the war minister, General Chazal. In 1855 he entered the staff corps and rose to the rank of lieutenant-general in 1877, having been appointed, in 1875, inspector-general of fortifications and of the corps of engineers. The preparation and execution of the defence works of the country, and particularly of Antwerp, and of the new works of the Meuse were carried out under his direction. In 1883 he went to Rumania to advise as to the fortification works required for the defence of the country, and presided over the elaboration of the scheme by which Bucarest was proposed to be made a first-class fortress. On his return to Belgium in 1884 he resumed his command of the Antwerp military district. He retired in 1886, but continued to supervise the Rumanian defences. He is a member of the Belgian Royal Academy of Science, and is widely known as an expert in fortification and as a writer of many military works. He originated in 1850 *Le journal de l'Armée Belge*. Some of his principal publications are: *Considérations politiques et militaires sur la Belgique*, 1851-52; *Histoire du duc de Wellington*, 1856-57; *Agrandissement général d'Anvers*, 1858; *Études sur la défense des états et sur la fortification*, 1863; *Traité de fortification-polygonale*, 1869; *La fortification à fossés secs*, 1872; *La défense des états et les camps retranchés*, 1876; *La fortification du champ de bataille*, 1878; *Tactique de combat des trois armes*, 1881; *Situation militaire de la Belgique: Travaux de défense de la Meuse*, 1882; *Le Général Comte Todleben, sa vie et ses travaux*, 1884; *La fortification du temps présent*, 1885.

Brianza, a district of Italy, called the "Garden of Lombardy." It lies between the two southern arms of Lake Como, and stretches south as far as Mariano. It is a hilly and beautiful country, which, although possessing no large town, is densely populated, and, owing to the mildness of its climate and the softness of its air, is a favourite summer resort of the Milanese. Area, about 170 sq. miles.

Briare, a town in the arrondissement of Gien, department of Loiret, France, on the right bank of the Loire, 43 miles in direct line S.E. of Orleans. A bust of Bapterosses (introducer of the button manufacture) was erected in 1897, and there is a handsome modern church. It has

manufactures of fine pottery, and the so-called porcelain buttons, made of specially prepared feldspar; with commerce in wine, wood, and coal. The *Canal of Briare* (about 37 miles long) unites the Loire with the Loing. A new port has been established on a branch of the lateral canal, opened in 1896, on which the traffic in 1898 was 36,217 tons; the traffic on the Canal de Briare being 57,512 tons. Population (1881), 4577; (1901), 5619.

Bribery and Corrupt Practices.—

Administrative corruption was dealt with by the British Parliament in the Public Bodies' Corrupt Practices Act, 1889. The public bodies concerned are county councils, town or borough councils, boards, commissioners, select vestries, and other bodies having local government, public health, or poor law powers, and having for those purposes to administer rates raised under public general Acts. The giving or receiving, promising, offering, soliciting or agreeing to receive any gift, fee, loan, or advantage by any person as an inducement for any act or forbearance by a member, officer, or servant of a public body in regard to the affairs of that body is made a misdemeanour in England and Ireland and a crime and offence in Scotland. Prosecution under the Act requires the consent of the Attorney- or Solicitor-General in England or Ireland and of the Lord Advocate in Scotland. Conviction renders liable to imprisonment with or without hard labour for a term not exceeding two years, and to a fine not exceeding £500, in addition to or in lieu of imprisonment. The offender may also be ordered to pay to the public body concerned any bribe received by him; he may be adjudged incapable for seven years of holding public office, *i.e.*, the position of member, officer, or servant of a public body; and if already an officer or servant, besides forfeiting his place, he is liable at the discretion of the court to forfeit his right to compensation or pension. On a second conviction he may be adjudged forever incapable of holding public office, and for seven years incapable of being registered or of voting as a parliamentary elector, or as an elector of members of a public body. An offence under the Act may be prosecuted and punished under any other Act applicable thereto, or at common law; but no person is to be punished twice for the same offence.

For a list of the principal statutes dealing with corrupt and illegal practices at elections, and for the effect of such practices in avoiding returns, see ELECTIONS.

Elections. Corrupt practices include bribery as defined by the Corrupt Practices Prevention Act, 1854, treating, undue influence, personation, and aiding, abetting, counselling, and procuring personation. The definition of treating has been extended to include the case where the treater is not a candidate, and the voter treated is guilty of the offence as well as the treater; the definition of undue influence now expressly includes the inflicting or threatening to inflict spiritual injury, damage, harm, or loss. Illegal practices are certain acts and omissions in regard to an election which are now prohibited, whether done or omitted, honestly or dishonestly. They may be classified under the following heads:—(1) Acts which are illegal practices by whomsoever committed. These are as follows: Payment or receipt or contracts to pay or receive money for conveyance of voters to or from the poll, on account of any committee room beyond the number allowed by the Act, or to an elector for use of house or land to exhibit addresses, &c., or for exhibition by him (otherwise than in the ordinary course of his business of advertising agent) of such addresses, &c.; payment of election expenses otherwise than by or through the election agent, and payment otherwise than to a candidate or election

agent of money provided by any other person for election expenses; voting or procuring to vote of any person prohibited from voting, if the person offending knows of the prohibition; knowingly publishing a false statement that a candidate has withdrawn, or publishing with a view to affect the return of a candidate a false statement as to his character or conduct. (2) Acts and omissions which are illegal practices in the case of candidates and agents only, being breaches of duties specially imposed on them. These are the payment or incurring expenses in excess of the maximum authorized by the Legislature, the omitting without lawful excuse to make a return and declaration of expenses in due time, and the payment by an election agent of any election expense amounting to 40s. not vouched by bill of particulars and receipt, of any claim for expenses not sent in in due time, or of any such claim after the time allowed for payment thereof. (3) Acts which are illegal practices when done by a candidate or agent, and are a minor offence when done by any one else. These are illegal payments, employment, and hiring, and printing, publishing, or posting a bill, placard, or poster not bearing on its face the name of the printer or publisher. Illegal payments are knowingly providing money for prohibited payments or expenses in excess of the maximum, corruptly inducing a candidate to withdraw by payment or promise of payment (the candidate so induced being guilty of the like offence), paying or agreeing to pay for torches, flags, banners, cockades, ribbons, and other marks of distinction (the receiver being guilty of the like offence if he is aware of the illegality). Illegal employment is the employment for payment or promise of payment of persons beyond the number allowed by the Legislature or for purposes not authorized. The employé is guilty of the like offence if he knows of the illegality. Illegal hiring is the letting or lending, or the employing, hiring, borrowing, or using to carry voters to the poll of stage, or hackney carriages, or horses, or of carriages or horses ordinarily let for hire, and the hiring of committee rooms in premises licensed for the sale of intoxicants, in a club (not being a permanent political club) where intoxicants are sold, in premises where refreshments are ordinarily sold, or in a public elementary school in receipt of a parliamentary grant. Personation and aiding, abetting, &c., of personation are felonies punishable with two years' imprisonment with hard labour. All other corrupt practices are indictable misdemeanours (in Scotland, crimes and offences) punishable with one year's imprisonment, with or without hard labour, or a fine not exceeding £200. Conviction of any corrupt practice also renders the offender incapable for seven years of being registered as an elector, or voting at any election, parliamentary or other, in the United Kingdom, or of holding any public or judicial office, or of being elected to or sitting in the House of Commons; and any such office or seat held by him at the time is vacated. In the case of a parliamentary candidate, if an election court finds that there has been treating or undue influence by him, or any other corrupt practice with his knowledge or consent, he becomes incapable of ever being elected for the same constituency, and incurs the like incapacities as if he had been convicted on indictment; if it is found by the election court that he has been guilty by his agents of a corrupt practice, he becomes incapable for seven years of being elected for the same constituency. Illegal practices are offences punishable on summary conviction with a fine not exceeding £100, and with five years' incapacity for being registered or voting as a parliamentary elector, or an elector to public office within the county or borough where the offence was committed. Illegal payments, employment, and hiring, and printing and publishing of

bills, &c., not bearing the printer's or publisher's name, are, when committed by any one who is not a candidate or agent, offences punishable on summary conviction with a fine not exceeding £100, but carry with them no incapacities. Where an election court finds that any illegal practice has been committed with the knowledge or consent of a parliamentary candidate, he becomes incapable for seven years of being elected to or sitting in the House of Commons for the same constituency. He incurs the like incapacity, limited to the duration of the parliament for which the election was held, if the election court finds that he was guilty by his agents of an illegal practice. A prosecution for any of the above offences cannot be instituted more than a year after the offence was committed, unless an inquiry by Election Commissioners takes place, in which case it may be instituted at any time within two years from the commission of the offence, not being more than three months after the date of the Commissioners' report.

The law as to corrupt and illegal practices, as above stated, applies to parliamentary, municipal, county, parochial, and school board elections. Incapacities corresponding to those incurred by parliamentary candidates found guilty by an election court are incurred by municipal and other candidates in the like case, *e.g.*, a municipal candidate found personally guilty of a corrupt practice is incapacitated forever, and a candidate found guilty by his agents is incapacitated for three years from holding corporate office in the borough. No maximum of expenses is prescribed for school board candidates, nor is any return and declaration of expenses required from them.

Bribery at elections of fellows, scholars, officers, and other persons in colleges, cathedral and collegiate churches, hospitals, and other societies is prohibited by the Act 31 Eliz. c. 6. If a member receives any money, fee, reward, or other profit for giving his vote in favour of any candidate, he forfeits his own place; if for any such consideration he resigns to make room for a candidate, he forfeits double the amount of the bribe, and the candidate by or on whose behalf a bribe is given or promised is incapable of being elected on that occasion. The Act is to be read at every election of fellows, &c., under a penalty of £40 in case of default. By the same Act any person for corrupt consideration presenting, instituting, or inducing to an ecclesiastical benefice or dignity forfeits two years' value of the benefice or dignity; the corrupt presentation is void, and the right to present lapses for that turn to the Crown, and the corrupt presentee is disabled from thereafter holding the same benefice or dignity; a corrupt institution or induction is void, and the patron may present. For a corrupt resignation or exchange of a benefice the giver and taker of a bribe forfeit each double the amount of the bribe. Any person corruptly procuring the ordaining of ministers or granting of licenses to preach forfeits £40, and the person so ordained forfeits £10, and for seven years is incapacitated from holding any ecclesiastical benefice or promotion.

(L. L. S.)

Bridge.—Bridge is a game of cards for four players developed out of the game of whist. It is probably of Russian origin. It appeared to have been first played in England about 1880 under the name of Biritch or Russian whist. It found its way to the London clubs about 1894, from which date its popularity rapidly increased. Bridge differs from whist in the following respects:—Although there are four players, yet in each hand the partner of the dealer takes no part in the play of that particular hand. After the first lead his cards are placed on the table exposed, and are played by the dealer as at dummy whist;

nevertheless the dealer's partner is interested in the result of the hand equally with the dealer. The trump suit is not determined by the last card dealt, but is selected by the dealer or his partner without consultation, the former having the first option. It is further open to them to play without a trump suit. The value of tricks and honours varies with the suit declared as trumps. Honours are reckoned differently from whist, and on a scale which is somewhat involved and illogical. There are five honours, the ten being accepted as one of them. The score for honours does not count towards winning or losing the rubber, but is added afterwards to the trick score in order to determine the value of the rubber. There is also a score for holding no trumps in one of the hands, and for winning a "slam."

The score has to be kept on paper. It is usual for the scoring block to have two vertical columns divided half-way by a horizontal line. The left column is for the scorers' side and the right for the opponents'. Honours are scored above the horizontal line and tricks below. The drawback to this arrangement is that, since the scores for each hand are not kept separately, it is generally impossible to trace an error in the score without going through the whole series of hands. A better plan, it seems, is to have four columns ruled, the inner two being assigned to tricks, the outer ones to honours. By this method a line can be reserved for each hand, and any discrepancy in the scores at once rectified.

The Portland Club drew up a code of laws in 1895, and this code, with a few amendments, was in July 1895 adopted by a joint committee of the Turf and Portland Clubs. The provisions of the code are here summarized. Each trick above 6 counts 2 points in a spade declaration, 4 in a club, 6 in a diamond, 8 in a heart, 12 in a no-trump declaration. The game consists of 30 points made by tricks alone. When one side has won two games the rubber is ended. The winners are entitled to add 100 points to their score. Honours consist of ace, king, queen, knave, ten, in a suit declaration. If a player and his partner conjointly hold 3 honours they score twice the value of a trick; if 4 honours, 4 times; if 5 honours, 5 times. If a player in his own hand hold 4 honours he is entitled to score 4 honours in addition to the score for conjoint honours; thus, if one player hold 4 honours and his partner the other their total score is 9 by honours. Similarly if a player hold 5 honours in his own hand he is entitled to score 10 by honours. If in a no-trump hand the partners conjointly hold 3 aces, they score 30 for honours; if 4 aces, 40 for honours. 4 aces in 1 hand count 100. On the same footing as the score for honours are the following: *chicane*, if a player hold no trump, in amount equal to 2 by honours; *grand slam*, if one side win all the tricks, 40 points; *little slam*, if they win 12 tricks, 20 points. At the end of the rubber the total scores, whether made by tricks, honours, *chicane*, *slam*, or rubber points, are added together, and the difference between the two totals is the number of points won.

The Play.—The cards are shuffled, cut, and dealt (the last card not being turned) as at whist; but the dealer cannot lose the deal by misdealing. After the deal is completed, the dealer makes the trump declaration, or passes the choice to his partner without remark. If the dealer's partner make the declaration out of his turn, either adversary may, without consultation, claim a fresh deal. If an adversary make a declaration, the dealer may claim a fresh deal or disregard the declaration. Then, after the declaration, either adversary may double, the leader having first option. The effect of doubling is that each trick is worth twice as many points as before; but the scores for honours, *chicane*, and *slam* are unaltered. If a declaration is doubled, the dealer and his partner

have the right of redoubling, thus making each trick worth four times as much as at first. The declarer has the first option. The other side can again redouble, and so on. It is well to limit the value to which a trick can reach to 100 points. In the play of the hand the laws are nearly the same as the laws of whist, except that the dealer may expose his cards and lead out of turn without penalty. Dummy cannot revoke. The dealer's partner may take no part in the play of the hand beyond reminding the dealer when it is his lead or dummy's, and guarding him against revoking.

Advice to Players.

In the choice of a suit two objects are to be aimed at: first, to select the suit in which the combined forces have the best chance of making tricks; secondly, to select the trump so that the value of the suit agrees with the character of the hand, *i.e.*, a suit of high value when the hands are strong and of low value when very weak. As the deal is a great advantage it generally happens that a high value is to be aimed at, but occasionally a low value is desirable. The task of selection should fall to the hand which has the most distinctive features, that is, either the longest suit or unusual strength or weakness. No consultation being allowed, the dealer must assume only an average amount of variation from the normal in his partner's hand. If his own hand has distinctive features beyond the average, he should name the trump suit himself, otherwise pass it to his partner. It may here be stated what is the average in these respects. As regards the length of suit, a player's long suit is rather more likely to be fewer than five than over five. If the dealer has in his hand a suit of five cards including two honours, it is probable that he has a better suit to make trumps than dummy; if the suit is in hearts or diamonds, and the dealer has a good hand, he ought to name the trump. As regards strength, the average hand would contain ace, king, queen, and knave or equivalent strength. Hands stronger or weaker than this by the value of a king or less may be described as featureless. If the dealer's hand is a king over the average, it is more likely than not that his partner will either hold a stronger hand, or will hold such a weak hand as will counteract the player's strength. The dealer would not, therefore, with such a hand declare no trump, especially as by making a no-trump declaration the dealer forfeits the advantage of holding the long trumps.

The following is a rough method of calculating the value of the player's chances:—Count each ace (above or below the player's share, 1 ace) as worth $1\frac{1}{2}$ tricks; each king, $\frac{3}{4}$ trick; each queen, $\frac{1}{2}$ trick; each knave, $\frac{1}{4}$ trick; each trump beyond $3\frac{1}{2}$, 1 trick. The result, multiplied by the suit value, gives the player's net expectation after deducting the value of the adversaries' chance. As regards the score for honours, compared with an average declaration with 2 honours, 3 honours are equivalent to half an extra trick, 4 honours to 2 extra tricks, and each honour short means a loss of half a trick. In no-trump declarations the value of high cards is nearly double that given above for suit declarations. When the decision has been left to dummy, he knows that he can expect less than average assistance from the dealer's hand. On this account he should deduct 1 trick for a no-trump, heart, or diamond declaration. When considering the strength of a hand, account must be taken whether the high cards are guarded or not; a king single is of less value than a queen guarded.

Declarations by Dealer.—A hand, to be strong enough for a no-trump declaration, should be a king and knave, or two queens above the average, or a king above the average, if all the honours are well guarded; and per-

haps even a queen above the average if all the suits are protected. But in doubtful cases a suit of 6 red cards with 2 honours, or even 4, all honours, is to be preferred. With an average hand declare 5 hearts with 2 honours, or 4 with 3 honours; 5 diamonds with 3 honours, or 4 all honours; 6 clubs with 3 honours, or 5 with 4 honours; 8 spades. With a weak hand, containing a king only, or a queen and knave, declare any suit containing 5 cards with 2 honours. With a very weak hand, containing no card higher than a 10, declare 6 hearts or 5 diamonds, or 4 clubs or 1 spade. Hands containing a suit headed by a strong sequence of high cards lend themselves especially to no-trump declarations. With an established black suit of 5 or 6 cards the dealer should declare no-trump if he has another suit protected. When very weak in red suits the dealer should propose rather more often, especially when blank in a suit. Thus with no hearts he should be content with 1 trump fewer in clubs and 2 trumps fewer in spades than when he has a fair suit of hearts.

Declarations by dummy.—When the dealer has passed the declaration to his partner, the latter knows that the dealer's hand is not strong, either as regards high cards or in the two red suits, whilst there is a slightly increased possibility of the dealer being strong in the black suits. This is about accurately represented by subtracting 1 trick in the case of a no-trump or red suit declaration. With the advantage of the long trumps, the dealer's side generally have still the better chance of winning the odd trick, and the cautious policy often adopted is a mistake. The value of dummy's chance, with different declarations, can be calculated by the method given above, and the best chosen. With a hand an ace above the average, or with 3 aces, no trumps should be declared, unless dummy has a suit of 6 hearts or diamonds. With a hand two queens above the average no trump should also be declared, unless there is a good red suit; and there are hands in which all suit declarations are so weak that a no-trump declaration can be made with a king above the average. With an average hand the best suit should be declared, if it consists of 5 cards. If there be no suit of 5 cards, it is sometimes better to declare 3 clubs or spades than 4 of a red suit. With a hand an ace below the average, a red suit should not often be selected unless it contains 6 cards; 4 clubs or 3 spades should be chosen in preference to a suit of 5 hearts or diamonds.

Doubling.—When either the dealer or his partner has declared no trumps, hearts, or diamonds, he is nearly certain to have a hand apparently worth two tricks above the normal; the average value of hands will probably be three tricks. It would appear to be to the adversaries' advantage to double whenever one of them holds a hand with a better face-value than the average strength that the declarer may be presumed to hold. But it has to be considered, first, that doubling gives the declarer a chance of redoubling should he hold an exceptionally strong hand; secondly, that doubling gives information to the dealer—not of much value when the doubler is on the declarer's left, but of great value when he is on the declarer's right. The player on the declarer's left is justified in doubling if the face-value of his hand is 4 tricks above the normal, by the method explained above. In order that the player on the declarer's right may be justified in doubling, his hand must be considerably stronger, or else his hand must be so free from tenaces that it is immaterial on which side the strength lies. A spade declaration can be much more freely doubled by either player. The presumption is that when the dealer declares spades his weakness fully counterbalances the advantage of the deal. When the dealer has declared spades, either adversary possessing a hand worth

two tricks above the normal can double. When dummy has declared spades, either adversary may double if his hand is worth three tricks above the normal. With a club declaration the strength that would justify doubling is intermediate between that in the case of spades and of a high declaration.

Sometimes the player who has the lead may be justified in doubling in a no-trump declaration on account of a suit established, having weakness in other suits. With such a hand he should not rely on any assistance from his partner. There is, however, one case in which the player on the right of the dealer should double a no-trump declaration. When he has an established suit of six or seven cards, it is of great importance that he should inform his partner of his strength in the suit. This he does by doubling; his partner then knows that there is great strength in one suit, and abandons his own game to lead the suit in which he is most likely to find his partner strong. This has become a recognized signal, but with a double interpretation. In England the player will lead the suit in which he himself is weakest. In America he will lead hearts, the suit in which the dealer is least likely to be strong. Regarded purely as a signal, reserving the device for the heart suit makes it of greater value, since the command given is of a definite character; often, even with moderate strength, it will save enough tricks to compensate for the doubled value. It must be admitted, however, that it approaches an arbitrary convention.

Redoubling.—When a declaration has been doubled, the declarer knows the minimum that he will find against him; he must be prepared to find occasionally strength against him considerably exceeding this minimum. Except in the case of a spade declaration, cases in which redoubling is justifiable are very rare.

The play of the hand.—In a no-trump declaration the main object is to bring in a long suit. In selecting the suit to establish, the dealer should be guided by the following considerations:—One hand should hold at least five cards of the suit. The two hands, unless with a sequence of high cards, should hold between them eight cards of the suit, so as to render it probable that the suit will be established in three rounds. The hand which contains the strong suit should be sufficiently strong in cards of re-entry. The suit should not be so full of possible tenaces as to make it disadvantageous to open it. The tricks lost should, if possible, be inevitable ones; for instance, of two suits of equal length, one headed by a king, queen, knave, the other by ace, king (there being no chance of catching the queen), the former should be chosen, since the ace of that suit will win a trick anyhow, but the queen of the latter suit will not unless the suit is opened early. As regards the play of the cards in a suit, it is not the object to make tricks early, but to make all possible tricks. Deep finesses should be made when there is no other way of stealing a trick. Tricks may be given away, if by so doing a favourable opening can be made for a finesse. When, however, it is doubtful with which hand the finesse should be made, it is better to leave it as late as possible, since the card to be finessed against may fall, or an adversary may fail, thus disclosing the suit. It is in general unsound to finesse against a card that must be unguarded. From a hand short in cards of re-entry, winning cards should not be led out so as to exhaust the suit from the partner's hand. Even a trick should sometimes be given away. For instance, if one hand holds seven cards headed by ace, king, and the other hand holds only two of the suit, although there is a fair chance of making seven tricks in the suit, it would often be right

to give the first trick to the adversaries. When one of the adversaries has shown a long suit, it is frequently possible to prevent its being brought in by a device, such as holding up a winning card, until the suit is exhausted from his partner's hand, or playing in other suits so as to give the player the lead whilst his partner has a card of his suit to return, and to give the latter the lead when he has no card to return. The dealer should give as little information as possible as to what he holds in his own hand, playing frequent false cards. Usually he should play the higher or highest of a sequence; still there are positions in which playing the higher gives more information than the lower; a strict adherence to a rule in itself assists the adversaries. In a suit declaration the positions are so numerous that no general remarks can be offered on the dealer's conduct of the hand.

In a no-trump declaration the opponents of the dealer should endeavour to find the longest suit in the two hands, or the one most easily established. With this object the leader should open his best suit. If his partner next obtains the lead he ought to return the suit, unless he himself has a suit which he considers better, having due regard to the fact that the first suit is already partially established. The opponents should employ the same tactics as the dealer to prevent the latter from bringing in a long suit; they can use them with special effect when the long suit is in the exposed hand.

To lead up to dummy's weak suits is a valuable rule. The converse, to lead through strength, must be used with caution, and does not apply to no-trump declarations. It is not advisable to adopt any of the recent whist methods of giving information. It is clear that, if the dealer's is the only hand kept secret, he, in addition to his natural advantage, has the further advantage of better information than either of the adversaries. In no-trump declarations, however, it is of great importance that a player should be able to show his strong suit. The original leader does this by his lead; his partner can often only show his by his discard. This he does by discarding from his weak suit. It is open to objection that he must sometimes unguard the dealer's or dummy's suit. When he considers it advisable to discard from his long suit, it is a recognized signal that he should discard a higher card before a low one. A similar method is used to show strength in the suit opened by his partner. In a suit declaration this signal sometimes has a different signification, and is taken to mean that the player has no more of the suit.

The highest of a sequence led through dummy will frequently tell the third player that he has a good finesse. The lowest of a sequence led through the dealer will sometimes explain the position to the third player, at the same time keeping the dealer in the dark.

When on dummy's left it is futile to finesse against a card not in dummy's hand. But with ace and knave, if dummy has either king or queen, the knave should usually be played, partly because the other high card may be in the leader's hand, partly because, if the finesse fails, the player may still hold a tenace over dummy. In a suit declaration it is frequently the best play for the original leader not to lead from his longest suit, as at whist, (1) because with so many cards exposed his partner is not likely to be deceived by the lead, and will probably lead the suit to him to greater advantage; (2) because there is not much chance of his bringing in a suit. He may often, with success, lead a singleton in hearts or diamonds, knowing from the declarations that he is not leading up to great strength, and that the suit is probably his partner's.

Playing to the score.—At the beginning of the hand

the chances are so great against any particular result, that at the score of love-all the advantage of getting to any particular score has no appreciable effect in determining the choice of suit. In the play of the hand, the advantage of getting to certain points should be borne in mind. The principal points to be aimed at are 6, 18, and, in a less degree, 22. The 2 points that take the score from 4 to 6 are worth 4, or perhaps 5, average points; and the 2 points that take the score from 6 to 8 are worth 1 point. When approaching game it is an advantage to make a declaration that may just take the player out, and, in a smaller degree, one that will not exactly take the adversaries out. When the score is 24 to 22 against the dealer, hearts and clubs are half a trick better relatively to diamonds than at the score of love-all. In the first and second games of the rubber the value of each point scored for honours is probably about a third of a point scored for tricks—in a close game rather less, in a one-sided game rather more. In the deciding game of the rubber, on account of the importance of winning the game, the value of each point scored for honours sinks to one-fifth of a point scored for tricks. (W. H. W.*)

Bridge of Allan, a police burgh (1870) and health resort of Stirlingshire, Scotland, on the Allan water, 3 miles N. of Stirling by rail and tramway. There are two public halls and two reading-rooms, a hydropathic establishment, a mineral spring and well-room, and a fine art and natural history museum. The industries are bleaching, dyeing, and paper-making. The private schools are noted. Population (1881), 3004; (1901), 3240.

Bridgend, a market town of South Wales on the Ogmore, 20 miles W. by N. of Cardiff by rail, in the southern parliamentary division of the county of Glamorgan. There are a town hall, and two lunatic asylums, for the county of Glamorgan and the county borough of Swansea, erected at a cost of nearly £200,000. Bridgend has a foundry, joinery works, a tannery, and brickworks. Area of urban district (created in 1894), 2448 acres; population (1881), 4153; (1901), 6399.

Bridgenorth, a municipal borough and market town in the Ludlow parliamentary division (since 1885) of Salop, England, on the Severn, 20 miles S.E. of Shrewsbury by rail. A steep line of rail between the Low and the High Town has been opened, and the town hall (1652) restored. Area, 1168 acres; population (1881), 5317; (1901), 6049.

Bridgeport, a town and city of Connecticut, U.S.A., and capital of Fairfield county, the town and city occupying the same area, situated on Long Island Sound, at the mouth of Pequannoc river. The New York, New Haven, and Hartford railway furnishes communication. There are extensive manufactures, which in 1890 employed over \$13,000,000 of capital, and produced more than \$22,000,000 of manufactured goods. The principal among these were corsets, steam-fitting and heating apparatus, and foundry and machine-shop products. In 1900 the assessed valuation of real and personal property was \$62,905,862, the tax rate \$13 per \$1000, and the net debt \$1,270,098. Population (1880), 27,643; (1890), 48,866; (1900), 70,996, of whom 22,281 were foreign-born, and 1149 were negroes. The death-rate in 1900 was 17.3.

Bridges.—The article in the ninth edition of this Encyclopædia ends with a description of the Tay Bridge, then in course of construction (1876).¹ That bridge was overturned in a storm on 28th December 1879, when an

aggregate length of 3000 feet of girders fell, this being one of the greatest disasters which ever occurred to an engineering structure. Since that time greater attention has been given to the loading forces acting on bridges, to the determination of the severest straining actions, and to the best and most economical arrangement of material. The general use of mild steel in place of wrought iron in bridge-work involves much greater care in the selection and testing of the material. The analysis of the secondary straining actions, bending and twisting due to the local conditions in which loads are applied to individual members, has been worked out. With more complete knowledge of the straining actions engineers have greater confidence in design, and bridges have been built with spans approaching the theoretical limit possible for the material used. Lastly, with increase of size, more study of methods of erection has been necessary, and it is recognized that in large bridges facility of erection becomes a governing consideration in design. In materials other than iron or steel the greatest change has been the extension of the use of cement concrete for foundations and substructures, and in some cases for the arches of large arched bridges. Concrete strengthened by iron bars or a network of steel has also been used, and seems likely to be of considerable value. In metal bridges wrought iron has been replaced by mild steel—a stronger, tougher, and better material. Ingot metal or mild steel was sometimes treacherous when first introduced, and accidents occurred, the causes of which were obscure. In fact, small differences of composition or variations in thermal treatment during manufacture involve relatively large differences of quality. Now it is understood that care must be taken in specifying the exact quality and in testing the material supplied. Structural wrought iron has a tenacity of 20 to 22½ tons per sq. in. in the direction of rolling, and an ultimate elongation of 8 or 10 per cent. in 8 inches. Across the direction of rolling the tenacity is about 18 tons per square inch, and the elongation 3 per cent. in 8 inches. Steel has only a small difference of quality in different directions. There is still controversy as to what degree of hardness, or (which is nearly the same thing) what percentage of carbon, can be permitted with safety in steel for structures.

The qualities of steel used may be classified as follows:—(a) Soft steel, having a tenacity of 22½ to 26 tons per sq. in., and an elongation of 32 to 24 per cent. in 8 in. (b) Medium steel, having a tenacity of 26 to 30 tons per sq. in., and 28 to 25 per cent. elongation. (c) Moderately hard steel, having a tenacity of 30 to 34 tons per sq. in., and 20 per cent. elongation. (d) Hard steel, having a tenacity of 34 to 40 tons per sq. in., and 10 per cent. elongation. Soft steel is used for rivets always, and sometimes for the whole superstructure of a bridge, but medium steel more generally for the plates, angle bars, &c., the weight of the bridge being then reduced by about 7 per cent. for a given factor of safety. Moderately hard steel has been used for the larger members of long span bridges. Hard steel, if used at all, is used only for compression members, in which there is less risk of flaws extending than in tension members. With medium or moderately hard steel all rivet holes should be drilled, or punched ⅛ inch less in diameter than the rivet and reamed out, so as to remove the ring of material strained by the punch.

The external forces acting on a bridge may be classified as follows:—I. The *live or temporary load*, for road bridges, is taken to be the weight of a dense crowd (about 120 lb per sq. ft.), or the weight of a heavily loaded waggon (say 10 to 25 tons on four wheels), while for railway bridges it is the weight of the heaviest train likely to come on the bridge. II. An allowance is sometimes made for *impact*, that is, the dynamical action of the live load due to irregularities of the permanent way or yielding of the structure. III. The *dead load* comprises the weight of the main girders, flooring and wind bracing, or total weight of the superstructure exclusive of any part

¹ Later information will be found, however, in the ninth edition under other headings, e.g., the Forth Bridge under RAILWAYS, xx. 234.

directly carried by the piers. IV. The *horizontal pressure* is due to a wind blowing transversely to the span. V. The *longitudinal drag* is due to the friction of a train when braked (about $\frac{1}{4}$ th of the weight of the train). VI. On a curved bridge the *centrifugal load* is due to the radial acceleration of the train. VII. In some cases changes of temperature set up stresses equivalent to those produced by an external load.

In the earlier girder railway bridges the live load was taken to be equivalent to a uniform load of one ton per foot run for each line of way. At that time locomotives on railways of 4 ft. *Live load.* 8½ in. gauge weighed at most 35 to 45 tons, and their length between buffers was such that the average load did not exceed one ton per foot run. Trains of waggons did not weigh more than three-quarters of a ton per foot run when most heavily loaded. The weights of engines and waggons are now greater, and in addition it is recognized that the concentration of the loading under the axles gives rise to straining actions greater than those due to the same load uniformly distributed. A modern heavy English tank locomotive may weigh 47 tons with a length over buffers of 30½ feet, and a wheel base of 16 feet. This corresponds to 1·53 tons per foot run of engine length. American locomotives are heavier. Thus, a consolidation engine and tender may weigh 126 tons, with a length over buffers of 57 feet, corresponding to an average load of 2·55 tons per foot run. In America long ore waggons are sometimes used which weigh loaded two tons per foot run. It is clear, with such variation in weight and in its distribution, that some typical arrangement of loads must be assumed representing in given cases the worst to be expected. Mr Waddell (*De Pontibus*, New York, 1898) proposes to arrange railways in seven classes, according to the live loads which may be expected from the character of their traffic, and to construct the bridges in accordance with this classification:—For the lightest class, he takes a locomotive and tender of 93·5 tons, 52 feet between buffers (average load=1·8 tons per foot run), and for the heaviest, a locomotive and tender weighing 144·5 tons, 52 feet between buffers (average load=2·77 tons per foot run). Waggons he assumes to weigh for the lightest class 1·3 tons per foot run, and for the heaviest 1·9 tons. Then he takes the live load for a bridge to consist of two such engines, followed by a train of waggons covering the span.

If a vertical load is imposed suddenly, but without velocity, work is done during deflection, and the deformation and stress are momentarily double those due to the same load at rest on the structure. No load of exactly this kind is ever applied to a bridge. But if a load is so applied that the deflection increases with speed, the stress is greater than that due to a very gradually applied load, and vibrations about a mean position are set up. The rails not being absolutely straight and smooth, centrifugal and lurching actions occur which alter the distribution of the loading. Again, rapidly-changing forces, due to the moving parts of the engine which are unbalanced vertically, act on the bridge; and, lastly, inequalities of level at the rail ends give rise to shocks. For all these reasons the stresses due to the live load are greater than those due to the same load resting quietly on the bridge. This increment is larger on the flooring girders than on the main ones, and on short main girders than on long ones. The impact stresses depend so much on local conditions that it is difficult to fix what allowance should be made. Mr E. H. Stone (*Trans. Am. Soc. of Civil Engineers*, xli. p. 467) collated some measurements of deflection taken during official trials of Indian bridges, and found the increment of deflection due to impact to depend on the ratio of dead to live load. By plotting and averaging he obtained the following results:—

Excess of Deflection and straining Action of a moving Load over that due to a resting Load.

Dead load in per cent. of total load	10	20	30	40	50	70	90
Live load in per cent. of total load	90	80	70	60	50	30	10
Ratio of live to dead load	9	4	2·3	1·5	1·0	0·43	0·10
Excess of deflection and stress due to moving load per cent.	23	13	8	5·5	4·0	1·6	0·3

These results are for the centre deflections of main girders, but Mr Stone infers that the augmentation of stress for any member, due to causes included in impact allowance, will be the same percentage for the same ratios of live to dead load stresses. Valuable measurements of the deformations of girders and tension members due to moving trains have been made by Mr Robinson (*Proc. Am.*

Soc. C. E., xvi.) and by Mr Turneure (*Proc. Am. Soc. C. E.* xli.). The latter used a recording deflectometer and two recording extensometers. The observations are difficult, and the inertia of the instrument is liable to cause error, but much care was taken. The most striking conclusions from the results are that the locomotive balance weights have a large effect in causing vibration, and next, that in certain cases the vibrations are cumulative, reaching a value greater than that due to any single impact action. Generally: (1) At speeds less than 25 miles an hour there is not much vibration. (2) The increase of deflection due to impact at 40 or 50 miles an hour is likely to reach 40 to 50 per cent. for girder spans of less than 50 ft. (3) This percentage decreases rapidly for longer spans, becoming about 25 per cent. for 75-foot spans. (4) The increase per cent. of boom stresses due to impact is about the same as that of deflection; that in web bracing bars is rather greater. (5) Speed of train produces no effect on the mean deflection, but only on the magnitude of the vibrations.

A purely empirical allowance for impact stresses has been proposed, amounting to 20 per cent. of the live load stresses for floor stringers; 15 per cent. for floor cross girders; and for main girders, 10 per cent. for 40-foot spans, and 5 per cent. for 100-foot spans. These percentages are added to the live load stresses.

The dead load consists of the weight of main girders, flooring, and wind-bracing. It is almost always reckoned as uniform per foot run, though sometimes allowance should be made for the increase of weight towards the centre of the span. The weight of the bridge flooring depends on the type adopted. Roughly, the weight of sleepers, rails, &c., is 0·25 ton per foot run for each line of way, while the rail girders, cross girders, or troughing weigh 0·15 to 0·25 ton. The weight of main girders increases rapidly with the span, and there is for any type of bridge a limiting span beyond which the dead load stresses exceed the assigned limit of working stress.

Let W_1 be the total live load, W_2 the total flooring load on a bridge of span l , both being considered for the present purpose to be uniform per foot run. Let $k(W_1 + W_2)$ be the weight of main girders designed to carry $W_1 + W_2$, but not their own weight in addition. Then

$$W_g = (W_1 + W_2)(k + k^2 + k^3 \dots)$$

will be the weight of main girders to carry $W_1 + W_2$ and their own weight (Buck, *Proc. Inst. C. E.* lxvii. p. 331). Hence,

$$W_g = (W_1 + W_2)k/(1 - k).$$

Since in designing a bridge $W_1 + W_2$ is known, $k(W_1 + W_2)$ can be found from a provisional design in which the weight W_g is neglected. The actual bridge must have the section of all members greater than those in the provisional design in the ratio $k/(1 - k)$.

Mr Waddell (*De Pontibus*) gives the following convenient empirical relations. Let w_1, w_2 be the weights of main girders per foot run for a live load p per foot run and spans l_1, l_2 . Then

$$\frac{w_2}{w_1} = \frac{1}{2} \left[\frac{l_2}{l_1} + \left(\frac{l_2}{l_1} \right)^2 \right].$$

Now let w'_1, w'_2 be the girder weights per foot run for spans l_1, l_2 , and live loads p' per foot run. Then

$$\frac{w'_2}{w'_1} = \frac{1}{5} \left(1 + 4 \frac{p'}{p} \right)$$

$$\frac{w'_2}{w'_1} = \frac{1}{10} \left[\frac{l_2}{l_1} + \left(\frac{l_2}{l_1} \right)^2 \right] \left(1 + 4 \frac{p'}{p} \right).$$

A partially rational approximate formula for the weight of main girders is the following (Unwin, *Wrought-Iron Bridges and Roofs*, 1869, p. 40):—Let W be the total distributed load on a girder exclusive of its own weight, in tons; W_1 , the weight of the girder; l , the span, in ft.; s , average stress, in tons, per sq. in. on gross section of members; d =depth of girder at centre, in ft.; r =ratio of depth of girder to span. Then

$$W_1 = \frac{Wl^2}{Cds - l^2} = \frac{Wlr}{Cs - lr}$$

where C is a constant for any type of bridge. It is not easy to fix the average stress s per sq. in. of gross section. Hence the formula is more useful in the form

$$W_1 = \frac{Wl^2}{kd - l^2} = \frac{Wlr}{k - lr}$$

where $k = (W_1 + W)lr/W_1$ is to be deduced from the data of some bridge previously designed for the same live load per foot run and the same working stresses. From some known examples, C varies from 1500 to 1800 for iron, and from 1200 to 1500 for steel bridges. $k = 6000$ to 7200 for iron, and =4800 to 6000 for steel bridges.

Much attention has been given to wind action since the disaster to the Tay Bridge in 1879. As to the maximum wind pressure on small plates normal to the wind, there is not much doubt. Anemometer observations show that pressures of 30 lb per sq. ft. occur in storms annually in many localities, and that occasionally higher pressures are recorded in

Wind pressure.

exposed positions. Thus at Bidstone, Liverpool, where the gauge has an exceptional exposure, a pressure of 80 lb per sq. ft. has been observed. In tornadoes, such as that at St Louis in 1896, it has been calculated, from the stability of structures overturned, that pressures of 45 to 90 lb per sq. ft. must have been reached. As to anemometer pressures, it should be observed that the recorded pressure is made up of a positive front and negative (vacuum) back pressure, but in structures the latter must be absent or only partially developed. Great difference of opinion exists as to whether on large surfaces the average pressure per sq. ft. is as great as on small surfaces, such as anemometer plates. The experiments of Sir B. Baker at the Forth Bridge showed that on a surface 30 ft. \times 15 ft. the intensity of pressure was less than on a similarly exposed anemometer plate. In the case of bridges there is the further difficulty that some surfaces partially shield other surfaces; one girder, for instance, shields the girder behind it (see *Brit. Assoc. Report*, 1884). In 1881 a committee of the Board of Trade decided that the maximum wind pressure on a vertical surface in Great Britain should be assumed in designing structures to be 56 lb per sq. ft. For a plate girder bridge of less height than the train, the wind is to be taken to act on a surface equal to the projected area of one girder and the exposed part of a train covering the bridge. In the case of braced girder bridges, the wind pressure is taken as acting on a continuous surface extending from the rails to the top of the carriages, plus the vertical projected area of so much of one girder as is exposed above the train or below the rails. In addition, an allowance is made for pressure on the leeward girder according to a scale. The committee recommended that a factor of safety of 4 should be taken for wind stresses. For safety against overturning they considered a factor of 2 sufficient. In the case of bridges not subject to Board of Trade inspection, the allowance for wind pressure varies in different cases. Mr Shaler Smith allows 300 lb per foot run for the pressure on the side of a train, and in addition 30 lb per sq. ft. on twice the vertical projected area of one girder, treating the pressure on the train as a travelling load. In the case of bridges of less than 50 feet span he also provides strength to resist a pressure of 50 lb per sq. ft. on twice the vertical projection of one truss, no train being supposed to be on the bridge.

For a long time engineers held the convenient opinion that, if the total dead and live load stress on any section of a structure (of iron) did not exceed 5 tons per sq. in., ample safety was secured. It is no longer possible to design by so simple a rule. In an interesting address to the British Association in 1885, Sir B. Baker described the condition of opinion as to the safe limits of stress as chaotic. "The old foundations," he said, "are shaken, and engineers have not come to an agreement respecting the rebuilding of the structure. The variance in the strength of existing bridges is such as to be apparent to the educated eye without any calculation. In the present day engineers are in accord as to the principles of estimating the magnitude of the stresses on the members of a structure, but not so in proportioning the members to resist those stresses. The practical result is that a bridge which would be passed by the English Board of Trade would require to be strengthened 5 per cent. in some parts and 60 per cent. in others, before it would be accepted by the German Government, or by any of the leading railway companies in America." Sir B. Baker then described the results of experiments on repetition of stress, and added that "hundreds of existing bridges which carry twenty trains a day with perfect safety would break down quickly under twenty trains an hour. This fact was forced on my attention nearly twenty-five years ago by the fracture of a number of girders of ordinary strength under a five-minutes' train service."

Practical experience taught engineers that though 5 tons per sq. in. for iron, or 6½ tons per sq. in. for steel, was safe or more than safe for long bridges with large ratio of dead to live load, it was not safe for short ones in which the stresses are mainly due to live load, the weight of the bridge being small. The experiments of Wöhler, repeated by Bauschinger, Sir B. Baker, and others, show that the breaking stress of a bar is not a fixed quantity, but depends on the range of variation of stress to which it is subjected, if that variation is repeated a very large number of times. Let K be the breaking strength of a bar per unit of section, when it is loaded once gradually to breaking. This may be termed the statical breaking strength. Let k_{max} be the breaking strength of the same bar when subjected to stresses varying from k_{max} to k_{min} .

alternately and repeated an indefinitely great number of times; k_{min} is to be reckoned + if of the same kind as k_{max} , and - if of the opposite kind (tension or thrust). The range of stress is therefore $k_{max} - k_{min}$, if the stresses are both of the same kind, and $k_{max} + k_{min}$, if they are of opposite kinds. Let $\Delta = k_{max} \mp k_{min}$ = the range of stress, where Δ is always positive. Then Wohler's results agree closely with the rule,

$$k_{max} = \frac{\Delta}{2} + \sqrt{(K^2 - n \Delta K)},$$

where n is a constant which varies from 1.3 to 2 in various qualities of iron and steel. For ductile iron or mild steel it may be taken as 1.5. For a statical load, range of stress nil, $\Delta = 0$, $k_{max} = K$, the statical breaking stress. For a bar so placed that it is alternately loaded and the load removed, $\Delta = k_{max}$, and $k_{max} = 0.6 K$. For a bar subjected to alternate tension and compression of equal amount, $\Delta = 2 f_{max}$ and $k_{max} = 0.33 K$. The safe working stress in these different cases is k_{max} divided by the factor of safety. It is sometimes said that a bar is "fatigued" by repeated straining. The real nature of the action is not well understood, but the word fatigue may be used, if it is not considered to imply more than that the breaking stress under repetition of loading diminishes as the range of variation increases.

It was pointed out as early as 1869 (Unwin, *Wrought-Iron Bridges and Roofs*) that a rational method of fixing the working stress, so far as knowledge went at that time, would be to make it depend on the ratio of live to dead load, and in such a way that the factor of safety for the live load stresses was double that for the dead load stresses. Let A be the dead load and B the live load, producing stress in a bar; $\rho = B/A$ the ratio of live to dead load; f_1 the safe working limit of stress for a bar subjected to a dead load only and f the safe working stress in any other case. Then

$$f = f_1 \frac{A+B}{A+2B} = f_1 \frac{1+\rho}{1+2\rho}.$$

The following table gives values of f so computed on the assumption that $f_1 = 7\frac{1}{2}$ tons per sq. in. for iron and 9 tons per sq. in. for steel.

Working Stress for combined Dead and Live Load. Factor of Safety twice as great for Live Load as for Dead Load.

	Ratio. ρ	$\frac{1+\rho}{1+2\rho}$	Values of f , tons per sq. in.	
			Iron.	Mild Steel.
All dead load . . .	0	1.00	7.5	9.0
	.25	0.83	6.2	7.5
	.33	0.78	5.8	7.0
	.50	0.75	5.6	6.8
	.66	0.71	5.3	6.4
Live load = Dead load	1.00	0.66	4.9	5.9
	2.00	0.60	4.5	5.4
	4.00	0.56	4.2	5.0
All live load . . .	∞	0.50	3.7	4.5

Bridge sections designed by this rule differ little from those designed by formulae based directly on Wöhler's experiments. This rule has been revived in America, and appears to be increasingly relied on in bridge-designing. (See *Trans. Am. Soc. C. E.* xli. p. 156.)

Weyrauch and Launhardt's method, based on an empirical expression for Wöhler's law, has been much used in bridge designing (see *Proc. Inst. C. E.* lxiii. p. 275). Let t be the statical breaking strength of a bar, loaded once gradually up to fracture (t = breaking load divided by original area of section); u the breaking strength of a bar loaded and unloaded an indefinitely great number of times, the stress varying from u to 0 alternately (this is termed the *primitive strength*); and, lastly, let s be the breaking strength of a bar subjected to an indefinitely great number of repetitions of stresses equal and opposite in sign (tension and thrust), so that the stress ranges alternately from s to $-s$. This is termed the *vibration strength*. Wöhler's and Bauschinger's experiments give values of t , u , and s , for some materials. If a bar is subjected to alternations of stress having the range $\Delta = f_{max} - f_{min}$, then, by Wöhler's law, the bar will ultimately break, if

$$f_{max} = F\Delta, \quad (1)$$

where F is some unknown function. Launhardt found that, for stresses always of the same kind, $F \propto (t-u)/(t-f_{max})$ approximately agreed with experiment. For stresses of different kinds Weyrauch found $F = (u-s)/(2u-s-f_{max})$ to be similarly approximate. Now let $f_{max}/f_{min} = \phi$, where ϕ is + or - according as the stresses are of the same or opposite signs. Putting the values of F in (1) and solving for f_{max} , we get for the breaking stress of a bar subjected to repetition of varying stress,

$$f_{max} = u \left(1 + \frac{t-u}{u} \phi \right) \quad [\text{Stresses of same sign.}]$$

$$f_{max} = u \left(1 + \frac{u-s}{u} \phi \right) \quad [\text{Stresses of opposite sign.}]$$

The working stress in any case is f_{max} divided by a factor of safety. Let that factor be 3. Then Wöhler's results for iron and Bauschinger's for steel give the following equations for tension or thrust :—

$$\begin{aligned} \text{Iron, working stress, } f &= 4.4 \left(1 + \frac{1}{2} \phi \right) \\ \text{Steel, ,, ,, } &= 5.87 \left(1 + \frac{1}{2} \phi \right). \end{aligned}$$

In these equations ϕ is to have its + or - value according to the case considered. For shearing stresses the working stress may have 0.8 of its value for tension. The following table gives values of the working stress calculated by these equations :—

Working Stress for Tension or Thrust by Launhardt and Weyrauch Formula.

	ϕ	$1 + \frac{\phi}{2}$	Working Stress f , tons per sq. in.	
			Iron.	Steel.
All dead load.	1.0	1.5	6.60	8.80
	0.75	1.375	6.05	8.07
	0.50	1.25	5.50	7.34
	0.25	1.125	4.95	6.60
All live load.	0.00	1.00	4.40	5.87
	-0.25	0.875	3.85	5.14
	-0.50	0.75	3.30	4.40
	-0.75	0.625	2.75	3.67
Equal stresses + and -	-1.00	0.500	2.20	2.93

To compare this with the previous table, $\phi = (A+B)/A = 1 + p$. Except when the limiting stresses are of opposite sign, the two tables agree very well. In bridge work this occurs only in some of the bracing bars.

It is a matter of discussion whether, if fatigue is allowed for by the Weyrauch method, an additional allowance should be made for impact. There was no impact in Wöhler's experiments, and therefore it would seem rational to add the impact allowance to that for fatigue; but in that case the bridge sections become larger than experience shows to be necessary. Some engineers escape this difficulty by asserting that Wöhler's results are not applicable to bridge work. They reject the allowance for fatigue (that is, the effect of repetition) and design bridge members for the total dead and live load, plus a large allowance for impact varying according to some purely empirical rule. (See Waddell, *De Pontibus*, p. 7.) Now in applying Wöhler's law, f_{max} for any bridge member is found for the maximum possible live load, a live load which though it may sometimes come on the bridge and must therefore be provided for, is not the usual live load to which the bridge is subjected. Hence the range of stress, $f_{max} - f_{min}$, from which the working stress is deduced, is not the ordinary range of stress which is repeated a practically infinite number of times, but is a range of stress to which the bridge is subjected only at comparatively long intervals.

Hence practically it appears probable that the allowance for fatigue made in either of the tables above is sufficient to cover the ordinary effects of impact also.

English bridge-builders are somewhat hampered in adopting rational limits of working stress by the rules of the Board of Trade. Nor do they all accept the guidance of Wöhler's law. The following are some examples of limits adopted. For the Dufferin Bridge (steel), the working stress was taken at 6.5 tons per sq. in. in bottom booms and diagonals, 6.0 tons in top booms, 5.0 tons in verticals and long compression members. For the Stanley Bridge at Brisbane, the limits were 6.5 tons per sq. in.

in compression boom, 7.0 tons in tension boom, 5.0 tons in vertical struts, 6.5 tons in diagonal ties, 8.0 tons in wind bracing, and 6.5 tons in cross and rail girders. In the new Tay Bridge the limit of stress is generally 5 tons per sq. in., but in members in which the stress changes sign 4 tons per sq. in.

Let a girder, supported at the ends, carry a fixed load W at m from the right abutment. The reactions at the abutments are $R_1 = Wm/l$ and $R_2 = W(l-m)/l$. The shears on vertical sections to the left and right of the load are R_1 and $-R_2$, and the dis-

tribution of shearing force is given by two rectangles (Fig. 1). Bending moment increases uniformly from either abutment to the load, at which the bending moment is $M = R_1 m = R_2 (l-m)$. The distribution of bending moment is given by the ordinates of a triangle. Next let the girder carry a **Straining** uniform load w per foot run (Fig. 2). The total load action is wl ; the reactions at abutments, $R_1 = R_2 = \frac{1}{2}wl$. The distribution of shear on vertical sections is given by the ordinates of a sloping line. The greatest bending moment is at the centre and $= M_c = \frac{1}{8}wl^2$. At any point x from the abutment, the bending moment is $M = \frac{1}{2}wx(l-x)$, an equation to a parabola.

Let a uniform train weighing w per foot run advance over a girder of span $2c$, from the left abutment. When it covers the girder to a distance x from the centre (Fig. 3) the total load is $w(c+x)$; the reaction at B is

$$R_2 = w(c+x) \times \frac{c+x}{4c} = \frac{w}{4c} (c+x)^2,$$

which is also the shearing force at C for that position of the load. As the load travels, the shear at the head of the train will be given by the ordinates of a parabola having its vertex at A,

Fig. 2.

Fig. 3.

maximum shear, and, with a travelling load like a railway train, this is greater for partial than for complete loading. Generally a girder supports both a dead and a live load. The distribution of total shear, due to a dead load w_d per foot run and a travelling load w_l per foot run, is shown in Fig. 4, arranged so that the dead load shear is added to the maximum travelling load shear of the same sign.

In the case of girders with braced webs, the tension bars of which are not adapted to resist a thrust, another circumstance due to the position of the live load must be considered. For a train advancing from the left, the travelling load shear in the left half of the span is of a different sign from that due to the dead load.

Fig. 5 shows the maximum shear at vertical sections due to a dead and travelling load, the latter advancing (Fig. 5, a) from the left and (Fig. 5, b) from the right abutment. Comparing the figures it will be seen that over a distance x near the middle of the girder the shear changes sign, according as the load advances from the left or the right. The bracing bars therefore for this part of the girder must be adapted to resist either tension or thrust. Further, the range of stress to which they are subjected is the sum of the stresses due to the load advancing from the left or the right. To find the greatest shear with a set of concentrated loads at fixed distances, let the loads advance from the left abutment, and let C be the section at which the shear is required (Fig. 6). The greatest shear at C may occur with W_1 at C. If W_1 passes beyond C, the shear at C will probably be greatest when W_2 is at C. Let R be the resultant of the loads on the bridge when

Fig. 4.

Fig. 5.

W_1 is at C. Then the reaction at B and shear at C is Rn/l . Next let the loads advance a distance a so that W_2 comes to C. Then the shear at C is $R(n+a)/l - W_1$, plus any reaction d at B, due to any additional load which has come on the girder during the movement. The shear will therefore be increased by bringing W_2 to C, if

$$Ra/l + d > W_1$$

and d is generally small and negligible.

This result is modified if the action of the load near the section is distributed to the bracing intersections by rail and cross girders.

In Fig. 7 the action of W is distributed to A and B by the flooring. Then the loads at A and B are $W(p-x)/p$ and Wx/p . Now let C (Fig. 8) be the section at which the greatest shear is required, and let the loads advance from the left till W_1 is at C. If R is the resultant of the loads then on the girder, the reaction at B and shear at C is Rn/l .

But the shear may be greater when W_2 is at C. In that case the shear at C becomes $R(n+a)/l + d - W_1$, if $a > p$, and $R(n+a)/l + d - W_1 a/p$, if $a < p$. If we neglect d , then the shear increases by moving W_2 to C, if $Ra/l > W_1$ in the first case, and if $Ra/l > W_1 a/p$ in the second case.

For the greatest bending moment due to a travelling live load, let a load of w per foot run advance from the left abutment (Fig. 9), and let its centre be at x from the left abutment. The reaction at B is $2wx^2/l$ and the bending moment at any section C, at m from the left abutment, is $2wx^2(l-m)/l$, which increases as x increases till the span is covered. Hence, for uniform travelling

Fig. 7.

loads, the bending moments are greatest when the loading is complete. In that case the loads on either side of C are proportional to m and $l-m$. In the case of a series of travelling loads at fixed distances apart passing over the girder from the left, let W_1, W_2 (Fig. 10), at distances x and $x+a$ from the left abutment, be their resultants on either side of C. Then the reaction at B is $W_1 x/l + W_2(x+a)/l$. The bending moment at C is

$$M = W_1 \frac{x}{l} (l-m) + W_2 m \left(1 - \frac{x+a}{l}\right).$$

If the loads are moved a distance Δx to the right, the bending moment becomes

$$M + \Delta M = W_1 \frac{x + \Delta x}{l} (l-m) + W_2 m \left(1 - \frac{x + \Delta x + a}{l}\right)$$

$$\Delta m = W_1 \frac{\Delta x}{l} (l-m) - W_2 \frac{\Delta x}{l} m,$$

and this is positive or the bending moment increases, if

$$W_1(l-m) > W_2 m, \text{ or } W_1/l > W_2/(l-m).$$

But these are the average loads per foot run to the left and right of C. Hence, if the average load to the left of a section is greater than that to the right, the bending moment at the section will be increased by moving the loads to the right, and vice versa.

Hence the maximum bending moment at C for a series of travelling loads will occur when the average load is the same on either side of C. If one of the loads is at C, spread over a very

small distance in the neighbourhood of C, then a very small displacement of the loads will permit the fulfilment of the condition. Hence the criterion for the position of the loads which makes the moment at C greatest is this: one load must be at C, and the other loads must be distributed, so that the average loads per foot on either side of C (the load at C being neglected) are nearly equal. If the loads are very unequal in magnitude or distance this condition may be satisfied for more than one position of the loads, but it is not difficult to ascertain which position gives the maximum moment. Generally one of the largest of the loads must be at C with as many others to right and left as is consistent with that condition. Fig. 11 shows the curve of bending moment under one of a series of travelling loads at fixed distances. Let W_1, W_2, W_3 traverse the girder from the left at fixed distances a, b . For the position shown the distribution of bending moment due to W_1 is given by ordinates of the triangle $A'CB'$; that due to W_2 by ordinates of $A'DB'$; and that due to W_3 by ordinates of $A'EB'$. The total moment at W_1 , due to three loads, is the sum $mC + mn + mo$ of the intercepts which the triangle sides cut off from the vertical under

Fig. 10.

Fig. 11.

W_1 . As the loads move over the girder, the points C, D, E describe the parabolas M_1, M_2, M_3 , the middle ordinates of which are $\frac{1}{2}W_1l$, $\frac{1}{2}W_2l$, and $\frac{1}{2}W_3l$. If these are first drawn it is easy, for any position of the loads, to draw the lines $B'C, B'D, B'E$, and to find the sum of the intercepts which is the total bending moment under a load. The lower portion of the figure is the curve of bending moments under the leading load. Till W_1 has advanced a distance a only one load is on the girder, and the curve $A'F$ gives bending moments due to W_1 only; as W_1 advances to a distance $a+b$, two loads are on the girder, and the curve FG gives moments due to W_1 and W_2 . GB' is the curve of moments for all three loads $W_1 + W_2 + W_3$.

Fig. 12 shows maximum bending moment curves for an extreme case of a short bridge with very unequal loads. The three lightly dotted parabolas are the curves of maximum moment for each of the loads taken separately. The three heavily dotted curves are curves of maximum moment under each of the loads, for the three loads passing over the bridge, at the given distances, from left to right. As might be expected, the moments are greatest in this case at the sections under the 15-ton load. The heavy continuous line gives the last-mentioned curve for the reverse direction of passage of the loads.

With short bridges it is best to draw the curve of maximum bending moments for some assumed typical set of loads in the way just described, and to design the girder accordingly. For longer bridges the funicular polygon affords a method of determining maximum bending moments which is perhaps more convenient. But very great accuracy in drawing this curve is unnecessary, because the rolling stock of railways varies so much that the precise magnitude and distribution of the loads which will pass over a bridge cannot be known. All that can be done is to assume a set of loads likely to produce somewhat severer straining than any probable actual rolling loads. Now, except for very short bridges

Fig. 9.

and very unequal loads, a parabola can be found which includes the curve of maximum moments. This parabola is the curve of maximum moments for a travelling load uniform per foot run. Let w be the load per foot run which would produce the maximum moments represented by this parabola. Then w may be termed the uniform load per foot equivalent to any assumed set of concentrated loads. Mr Waddell has calculated tables of such equivalent uniform loads. But it is not difficult to find w , approximately enough for practical purposes, very simply. Experience

Fig. 12.

shows that (a) a parabola having the same ordinate at the centre of the span, or (b) a parabola having the same ordinate at one-quarter span as the curve of maximum moments, agrees with it closely enough for practical designing. A criterion already given shows the position of any set of loads which will produce the greatest bending moment at the centre of the bridge, or at one-quarter span. Let M_c and M_a be those moments. At a section distant x from the centre of a girder of span $2c$, the bending moment due to a uniform load w , per foot run is

$$M = \frac{w}{2} (c-x)(c+x).$$

Putting $x=0$, for the centre section

$$M_c = \frac{wc^2}{2};$$

and putting $x = \frac{1}{2}c$, for section at quarter span

$$M_a = \frac{3wc^2}{8}.$$

From these equations a value of w can be obtained. Then the bridge is designed, so far as the direct stresses are concerned, for bending moments due to a uniform dead load and the uniform equivalent load w .

In dealing with the action of travelling loads much assistance may be obtained by using a line termed an *influence line*. Such a line has for abscissa the distance of a load from one end of a girder, and for ordinate the bending moment or shear at any given section, or on any member, due to that load. Generally the influence line is drawn for unit load. In Fig. 13 let $A'B'$ be a

Fig. 13.

girder supported at the ends and let it be required to investigate the bending moment at C' due to unit load in any position on the girder. When the load is at F' , the reaction at B' is m/l and the moment at C' is $m(l-x)/l$, which will be reckoned positive, when it resists a tendency of the right-hand part of the girder to turn

counter-clockwise. Projecting $A'F'C'B'$ on to the horizontal AB , take $Ff = m(l-x)/l$, the moment at C of unit load at F . If this process is repeated for all positions of the load, we get the influence line AGB for the bending moment at C . The area AGB is termed the influence area. The greatest moment CG at C is $x(l-x)/l$. To use this line to investigate the maximum moment at C due to a series of travelling loads at fixed distances, let P_1, P_2, P_3, \dots be the loads which at the moment considered are at distances m_1, m_2, \dots from the left abutment. Set off these distances along AB and let y_1, y_2, \dots be the corresponding ordinates of the influence curve ($y = Ff$) on the verticals under the loads. Then the moment at C due to all the loads is

$$M = P_1 y_1 + P_2 y_2 + \dots$$

The position of the loads which gives the greatest moment at C may be settled by the criterion given above. For a uniform travelling load w per foot of span, consider a small interval $Fk = \Delta m$ on which the load is $w\Delta m$. The moment due to this, at C , is $w\Delta m(l-x)\Delta m/l$. But $m(l-x)\Delta m/l$ is the area of the strip $Ffkh$, that is $y\Delta m$. Hence the moment of the load on Δm at C is $w y \Delta m$, and the moment of a uniform load over any portion of the girder is $w \times$ the area of the influence curve under that portion. If the scales are so chosen that a inch represents one inch ton of moment, and b inch represents one foot of span, and w is in tons per foot run, then ab is the unit of area in measuring the influence curve.

If the load is carried by a rail girder (stringer) with cross girders at the intersections of bracing and boom, its effect is distributed to the bracing intersections $D'E'$ (Fig. 14), and the part of the influence line for that bay (panel) is altered. With unit load in the position shown, the load at D' is $(p-n)/p$, and that at E' is n/p . The moment of the load at C is $m(l-x)/l - n(p-n)/p$. This is the equation to the dotted line RS (Fig. 13).

If the unit load is at F' , the reaction at B' and the shear at C' is m/l , positive if the shearing stress resists a tendency of the part of the girder on the right to move upwards; set up $Ff = m/l$ (Fig. 15) on the vertical under the load. Repeating the process for other positions, we get the influence line $AGHB$, for the shear at C due to unit load anywhere on the girder. $GC = x/l$ and $CH = -(l-x)/l$. The lines AG, HB are parallel. If the load is in the bay $D'E'$ and is carried by a rail girder which distributes it to cross girders at $D'E'$, the part of the influence line under this bay is altered. Let n (Fig. 16) be the distance of the load from D' , x_1 the

Fig. 14.

Fig. 15.

distance of D' from the left abutment, and p the length of a bay. The loads at D', E' , due to unit weight on the rail girder are $(p-n)/p$ and n/p . The reaction at B' is $\{(p-n)x_1 + n(x_1 + p)\}/pl$. The shear at C' is the reaction at B' less the load at E' , that is $\{p(x_1 + n) - n\}/pl$, which is the equation to the line DH (Fig. 15).

Clearly, the distribution of the load by the rail girder considerably alters the distribution of shear due to a load in the bay in which the section considered lies. The total shear due to a series of

Fig. 16.

are very unequal or unequally spaced, a trial or two will determine which position gives the greatest value of S . The greatest shear at C' of the opposite sign to that due to the loading of the longer segment occurs with the shorter segment loaded. For a uniformly-distributed load w per foot run the shear at C is $w \times$ the area of the influence curve under the segment covered by the load, attention being paid to the sign of the area of the curve. If the load rests directly on the main girder, the greatest + and - shears at C will be $w \times AGC$ and $-w \times CHB$. But if the load is distributed to the bracing intersections by rail and cross girders, then the shear at C' will be greatest when the load extends to N , and will have the values $w \times ADN$ and $-w \times NEB$.

Influence lines were described by Fränkel, *Der Civilingenieur*, 1876. See also *Handbuch der Ingenieurwissenschaften*, vol. ii. ch. x., 1882, and Levy, *La statique graphique*, 1886. There is a useful paper by Prof. G. F. Swain (*Trans. Am. Soc. C. E.* xvii., 1887), and another by L. M. Hoskins (*Proc. Am. Soc. C. E.* xxv., 1899).

Another method of investigating the maximum shear at a section due to any distribution of a travelling load has been given by Prof. H. T. Eddy (*Trans. Am. Soc. C. E.* xxii., 1890). Let hk (Fig. 17) represent in magnitude and position a load W , at x from the left abutment, on a girder AB of span l . Lay off kf , hg , horizontal and equal to l . Join f and g to h and k . Draw verticals at A , B , and join no . Obviously no is horizontal and equal to l . Also $mn/mf = hk/kf$ or $mn = W(l-x)/l$, which is the reaction at A due to the load at C , and is the shear at any point of AC . Similarly, po is the reaction at B and shear at any point of CB . The shaded rectangles represent the distribution of shear due to the load at C , while no may be termed the datum line of

Fig. 17.

shear. Let the load move to D , so that its distance from the left abutment is $x+a$. Draw a vertical at D , intersecting fh , kg , in s and q . Then $qr/ro = hk/hg$ or $ro = W(l-x-a)/l$, which is the reaction at A and shear at any point of AD , for the new position of the load. Similarly, $rs = W(x+a)/l$ is the shear on DB . The distribution of shear is given by the partially-shaded rectangles. For the application of this method to a series of loads Prof. Eddy's paper must be referred to.

In the case of a bridge of many spans, there is a length of span which makes the cost of the bridge least. The cost of abutments and bridge flooring is practically independent of the length of span adopted. Let P be the cost of one pier; G the cost of the main girders for one span, erected; n the number of spans; l the length

of one span, and L the length of the bridge between abutments. Then, $n=L/l$ nearly. Cost of piers $(n-1)P$. Cost of main girders nG . The cost of a pier will not vary materially with the span adopted. It depends mainly on the character of the foundations and height at which the bridge is carried. The cost of the main girders for one span will vary nearly as the square of the span for any given type of girder and intensity of live load. That is, $G=al^2$, where a is a constant. Hence the total cost of that part of the bridge which varies with the span adopted is—

$$C = (n-1)P + nal^2 \\ = LP/l - P + La l.$$

Differentiating and equating to zero, the cost is least when

$$\frac{dC}{dl} = -\frac{LP}{l^2} + La = 0, \\ P = al^2 = G;$$

that is, when the cost of one pier is equal to the cost erected of the main girders of one span. Sir Guildford Molesworth puts this in a convenient but less exact form. Let G be the cost of superstructure of a 100-foot span erected, and P the cost of one pier with its protection. Then the economic span is $l=100\sqrt{P/G}$.

All the earlier arched bridges were of masonry or brickwork, so built that they could be treated as blockwork structures composed of rigid voussoirs. The stability of such structures depends on the position of the line of pressure in relation to the extrados and intrados of the arch ring. Generally the line of pressure lies within the middle half of the depth of the arch ring. In finding the line of pressures some principle such as the principle of least action must be used in determining the reactions at the crown and springings. For an elastic arch of metal there is a complete theory, but it is difficult, and there is always some doubt as to the validity of some of the assumptions which must be made. If hinges are introduced at crown and springings, the calculation of the stresses in the arch ring becomes simple, as the line of pressures must pass through the hinges. Such hinges have been used not only for metal arches, but in a modified form for masonry and concrete arches. Three cases therefore arise: (a) The arch is rigid at crown and springings; (b) the arch is two-hinged (hinges at springings); (c) the arch is three-hinged (hinges at crown and springings). For an elementary account of the theory of arches, hinged or not, reference may be made to a paper by Mr H. M. Martin (*Proc. Inst. C. E.* vol. xciii. p. 462); and for that of the elastic arch, to a paper by Mr A. E. Young (*Proc. Inst. C. E.* vol. cxxxi. p. 323).

In Germany three hinged arches of masonry and concrete have been built, up to 150 feet span, with much economy, and the calculations being simple, an engineer can venture to work closely to the dimensions required by theory. For hinges, Mr Liebbbrand, of Stuttgart, uses sheets of lead about one inch thick extending over the middle third of the depth of the voussoir joints, the rest of the joints being left open. As the lead is plastic this construction is virtually an articulation. If the pressure on the lead is uniformly varying, the centre of pressure must be within the middle third of the width of the lead; that is, it cannot deviate from the centre of the voussoir joint by more than one-eighteenth of its depth. In any case the position of the line of pressures is confined at the lead articulations within very narrow limits, and ambiguity as to the stresses is greatly diminished. The restricted area on which the pressure acts at the lead joints involves greater intensity of stress than has been usual in arched bridges. In the Würtemberg hinged arches a limit of stress of 110 tons per square foot was allowed, while in the unhinged arches at Cologne and Coblenz the limit was 50 to 60 tons per square foot (*Annales des Ponts et Chaussées*, 1891). At Rechtenstein a bridge of two concrete arches has been constructed, span $75\frac{1}{2}$ feet, with lead articulations: width of arch 11 feet; depth of arch at crown and springing 2.1 and 2.96 feet respectively. The stresses were calculated to be 15, 17, and 12 tons per square foot at crown, joint of rupture, and springing respectively. At Cincinnati, a concrete arch of 70 feet span has been built, with a rise of 10 feet. The concrete is reinforced by eleven 9-inch steel-rolled joists, spaced 3 feet apart and supported by a cross channel joist at each springing. The arch is 15 inches thick at the crown and 4 feet at the abutments. The concrete consisted of 1 cement, 2 sand, and 3 to 4 broken stone. An important series of experiments on the strength of masonry,

(From a Photograph by C. Talbot, London.)

brick, and concrete structures will be found in the *Zeitschr. des Oesterreich. Ing. und Arch. Vereines*, 1895.

Recently steel arches of great span have been constructed, partly because they have a better appearance than girder bridges, but mainly because they can be erected without false works. The first very important bridges of this kind were the St. Louis Bridge (for description, see article BRIDGES in *Ency. Brit.* vol. iv. p. 339), and the Douro Bridge (Fig. 18). Amongst other examples the Washington Bridge over the Harlem river, New York, may be mentioned (see Plate). It has a length of 2375 feet, with a roadway 80 feet in width, 133 feet above the river. Two principal arches are 510 feet span, springing from granite piers. Each steel arch has six ribs resting on steel pins 34 inches long and 18 inches in diameter, carried on steel bearings. The ribs, of a nearly uniform depth of 13 feet, are formed of a web plate and flanges of steel plate. The Niagara arched Railway Bridge, replacing a suspension bridge, was erected without stopping the traffic. The span is 550 feet and the rise 114 feet. The hinges are formed of two steel castings. Between

Fig. 18.

the convex face of the upper and concave face of the lower casting are 45 segmental rollers set radially to the centre of movement. The pressure on the rollers is one ton per lineal inch. The Garabit Viaduct carries the railway near St Flour, in the Cantal Department, France, at 420 feet above low water. The deepest part of the valley is crossed by an arch of 541 feet span, and 213 feet rise. The bridge is similar to that at Oporto, also designed by Mr Seyrig. It is formed by a crescent-shaped arch, continued on one side by four, on the other side by two lattice girder spans, on iron piers. The arch is formed by two lattice ribs hinged at the abutments. Its depth at the crown is 33 feet, and its centre line follows nearly the parabolic line of pressures. The two arch ribs are 65½ feet apart at the springings and 20½ feet at the crown. The roadway girders are lattice, 17 feet deep, supported from the arch ribs at four points. The total length of the viaduct is 1715 feet. The lattice girders of the side spans were first rolled into place, so as to project some distance beyond the piers, and then the arch ribs were built out, being partly supported by wire-rope cables from the lattice girders above. The total weight of ironwork was 3200 tons and the cost £124,000 (*Annales des travaux publics*, 1884).

In suspension bridges the principal member is in tension, and can be made of material of great tenacity, such as wire. The compression member required in girder bridges is absent. Hence, suspension bridges should be economical in cost. But, on the other hand, expensive piers and anchorages are necessary, together with stiffening members to counteract the flexibility of the chain. The Ordish Bridge, built at

Suspension bridges.

Prague in 1868, had oblique chains supporting the stiffening girders at intermediate points of the span. A curved chain supports the oblique chains and keeps them straight. Cables are now made of wire either in twisted strands or laid parallel. In the East River Bridge, New York (see Plate), the individual wires forming the cable were led over the piers one by one, thus avoiding the severe straining to which heavy cables are subjected from flexure over the saddles and elsewhere during erection.

The Brooklyn Bridge, New York, including approaches, is 5989 feet long. The centre span is 1595½ feet, and the clear height over the water 135 feet. The tower piers are built on caissons. The roadway is suspended from four steel-wire cables. Number of wires in strands of cable, 278; strands in each cable, 19; wires (7 B.W.G.) in each cable, 5296; strength of cable per square inch, 71 tons; total weight of bridge, 14,680 tons; approximate cost, £3,067,000.

The Tower Bridge, London, is a suspension bridge with a secondary bascule bridge in the centre span to permit the passage of ships (see Plate). Two main towers in the river and two towers on the shore abutments carry the suspension chains. The opening bridge between the river towers consists of two leaves or bascules, pivoted near the faces of the piers and rotating in a vertical plane. When raised, the width of 200 feet between the main river piers is unobstructed up to the high-level foot-bridge,

which is 141 feet above Trinity H.W. The clear width of the two shore spans is 270 feet. The total length of the bridge is 940 feet, and that of the approaches 1260 feet on the north and 780 feet on the south. The width of the bridge between parapets is 60 feet, except across the centre span, where it is 49 feet. The main towers consist of a skeleton of steel, enclosed in a facing of granite and Portland stone, backed with brickwork. There are two high-level footways for use when the bascules are raised, the main girders of which are of the cantilever and suspended girder type. The cantilevers are fixed to the shore side of the towers. The middle girders are 120 feet in length and attached to the cantilevers by links. The main suspension chains are carried across the centre span in the form of horizontal ties resting on the high-level footway girders. These ties are jointed to the hanging chains by pins 20 inches in diameter with a ring in halves surrounding it 5 inches thick. One half ring is rigidly attached to the tie and one to the hanging chain, so that the wear due to any movement is distributed over the length of the pin. A rocker bearing under these pins transmits the load at the joint to the steel columns of the towers. The abutment towers are similar to the river towers. On the abutment towers the chains are connected by horizontal links, carried on rockers, to anchor ties. The suspension chains are constructed in the form of braced girders, so that they are stiff against unsymmetrical loading. Each chain over a shore span consists of two segments, the longer attached to the tie at the top of the river tower, the shorter to the link at the top of the abutment tower, and the two jointed together at the lowest point. Transverse girders are hung from the chains at distances of 18 feet. There are fifteen main transverse girders to each shore span, with nine longitudinal girders between each pair. The trough flooring, ¾ inches thick and 6 inches deep, is riveted to the longitudinals. The anchor ties are connected to girders embedded in large concrete blocks in the foundations of the approach viaducts.

The two bascules are each constructed with four main girders. Over the river these are lattice girders, with transverse girders 12 feet apart, and longitudinal and subsidiary transverse girders dividing the floor into rectangles 3 feet by 3½ feet covered with buckled plates. The roadway is of pine blocks doweled. The bascules rotate through an angle of 82°, and their rear ends in the bascule chambers of the piers carry 365 tons of counterweight, the total weight of each being 1070 tons. They rotate on steel shafts 21 inches in diameter and 48 feet long, and the bascules can be lifted or lowered in one minute, but usually the time taken is one and a half minutes. They are worked by hydraulic machinery.

The main girders of girder bridges consist of three principal members, a tension and compression boom or chord, and a web. When the booms are parallel the web resists the shear. If one or both **Girder bridges.** booms are curved the straining action on the web is diminished. At first the girders had plate webs even for large spans, but now plate webs are not used for spans over 50 to 75 feet. The web in modern girders is an arrangement of struts and ties termed bracing. In some girder bridges the members are jointed or connected by pins, in others they are more rigidly connected by riveting. The pin connexion system first used in England in the Crumlin and Newark Dyke Bridges is now much more commonly adopted in America, so that it has come to be regarded as a distinctively American feature. With pin connexions some weight is saved in the girders, and erection is easier, but the girders are less rigid than riveted girders and suffer more from oxidation. Commonly now the pin connexion is restricted to tension members. A fundamental difference in girder bridges arises from the method of support. In the simplest case the main girders are supported at the ends, and if there are several spans, are discontinuous. Next, the main girder may be supported at more than two points so as to be continuous over two or more spans. This economizes weight, but the objection is that very small alterations of level of the supports involve comparatively large differences in the straining action. Settlement of one of the piers might perhaps render the girder unsafe. A girder may be supported at the centre and then forms a pair of cantilevers. Lastly, some bridges are composed of cantilevers and suspended girders. The main girder is then virtually a continuous girder hinged at the points of contrary flexure so that no ambiguity can arise as to the stresses.

Figs. 19, 20, and 21 show an independent girder, a cantilever, and a suspended girder bridge.

In a three-span bridge continuous girders are lighter than discontinuous ones by about 45 per cent. for the dead load and 15 per cent. for the live load, if no allowance is made for ambiguity due to uncertainty as to the level of the supports. The cantilever and suspended girder types are as economical and free from uncertainty as to the stresses. In long-span bridges the cantilever system permits erection by building out, which is economical and sometimes necessary. It is, however, unstable unless rigidly fixed at the piers. In the Forth Bridge stability is obtained partly by the great excess of dead over live load, partly by the great width of the river piers. The majority of bridges not of great span have girders with parallel booms. This

Fig. 19.

Fig. 20.

involves the fewest difficulties of workmanship and perhaps permits the closest approximation of actual to theoretical dimensions of the parts. In spans over 200 feet it is economical to have one horizontal boom and one polygonal (approximately parabolic) boom. The hog-backed girder is a compromise between the two types, avoiding some difficulties of construction near the ends of the girder.

Fig. 21.

Most braced girders may be considered as built up of two simple forms of truss, the king-post truss (Fig. 22, a), or the queen-post truss (Fig. 22, b). These may be used either in the upright or the inverted position. A multiple truss consists of a number of simple

Fig. 22.

trusses, e.g., Bollman truss (see BRIDGES, ninth edition). Some timber bridges consist of queen-post trusses in the upright position, as shown diagrammatically in Fig. 23, where the circles indicate points at which the flooring girders transmit load to the main

Fig. 23.

girders. Compound trusses consist of simple trusses used as primary, secondary, and tertiary trusses, the secondary supported on the primary, and the tertiary on the secondary. Thus, the Fink truss consists of king-post trusses; the Pratt truss (Fig.

24) and Whipple truss (Fig. 25) of queen-post trusses; the Warren truss of queen-post trusses alternately upright and inverted.

A combination bridge is built partly of timber, partly of steel, the compression members being generally of timber and the tension

Fig. 24.

members of steel. On the Pacific coast, where excellent timber is obtainable and steel works are distant, combination bridges are still largely used (Ottewill, *Trans. Am. Soc. Civil Eng.* xxvii. p. 467). The combination bridge at Roseburgh, Oregon, is a cantilever bridge. The shore arms are 147 ft. span, the river arms 105 ft., and the suspended girder 80 ft., the total distance between anchor piers being 584 ft. The floor beams, floor, and railing are of timber. The compression members are of timber

Fig. 25.

except the struts and bottom chord panels next the river piers, which are of steel. The tension members are of iron and the pins of steel. The chord blocks and post shoes are of cast iron.

The exceptional local conditions at the site of the Forth Bridge led to the adoption there of the cantilever system, till then little considered. Now it is well understood that in many positions that system is the simplest, most convenient, and most economical method of bridging. The spans are virtually reduced to smaller spans so far as the girders are concerned; and what is much more important, the cantilevers can be built out from the piers, member by member, and no river staging is required. Mr. Waddell has shown that, in some cases, it is convenient to erect simple independent spans, by building them out as cantilevers and converting them into independent girders after erection. Fig. 26 shows girders erected in this way, the dotted lines being temporary members during erection, which are removed

Fig. 26.

afterwards. The side spans are erected first on staging and anchored to the piers. From these, by the aid of the temporary members, the centre span is built out from both sides. The principal cantilever bridges are (1) the Forth Bridge, with two central spans of 1710 ft., and two anchor spans of 680 ft.; (2) the railway bridge at Memphis over the Mississippi, span 790 ft.; (3) the Red Rock Bridge over the Colorado river, with a span of 660 ft. and anchor spans of 165 ft., suspended girder 330 ft. in length; (4) the Poughkeepsie Bridge over the Hudson; (5) the Lansdowne Bridge over the Indus at Sukkur, which, though designed later, was erected earlier than the Forth Bridge; (6) the Niagara Bridge for a railway—towers 495 ft. high, cantilever arms each 175 ft., suspended girder 120 ft., total length of bridge 910 ft.

The Forth Bridge was described in *Ency. Brit.* vol. xx. p. 234. Further details may be found in *The Forth Bridge*, by W. Westhofen, reprinted from *Engineering*; "The Forth Bridge," by Sir B. Baker, *Reports of British Association*, 1884 and 1885; *Die Forth Brücke*, von G. Barkhausen, Berlin, 1889; *The Forth Bridge*, by Philip Philips, Edinburgh. In the Sukkur Bridge (Fig. 27), the

Fig. 27.

clear span is 790 ft., and the suspended girder 200 ft. in length. The span to the centres of the end uprights is 820 ft.; width between centres of main uprights at bed-plate 100 ft., and between centres of main members at end of cantilevers 20 ft. The bridge is for a single line of railway of 5 ft. 6 in. gauge. The back guys are the most heavily strained part of the structure, the stress provided for being 1200 tons. This is due to the half weight of

centre girder, the weight of the cantilever itself, the rolling load on half the bridge, and the wind pressure. The anchors are built up of steel plates and angle bars, and are buried in a large mass of concrete. The area of each anchor plate, normal to the line of stress, is 32 ft. by 12 ft. The bridge was designed by Sir A. Rendel, the consulting engineer to the Indian Government.

In the United States, few railway companies design or build their own bridges. General specifications as to span, loading, &c., are furnished to bridge-building companies, which make the design under the direction of engineers who are experts in this kind of work. The design, with strain sheets and detail drawings, is submitted to the railway engineer with estimates. The result is that American bridges are generally of well-settled types and their members of uniform design, carefully considered with reference to convenient and accurate manufacture. Standard patterns of details are largely adopted, and more system is introduced in the workshop than is possible where designs are more varied. Riveted plate girders are used up to 50 ft. span, riveted braced girders for spans of 50 ft. to 75 ft., and pin-connected girders for longer spans. Since the erection of the Forth Bridge, cantilever bridges have been extensively used, and some remarkable steel arch and suspension bridges have also been constructed. Overhead railways are virtually continuous bridge constructions, and much attention has been given to a study of the special conditions appertaining to that case.

Consideration of the local conditions affecting the erection of bridges is always important, and sometimes becomes a controlling factor in the determination of the design. The methods of erection may be classed as—(1) erection on staging or falsework; (2) floating to the site and raising; (3) rolling out from one abutment; (4) building out member by member, the completed part forming the stage from which additions are handled.

(1) In erection on staging, the materials available determine the character of the staging; stacks of timber, earth banks, or built-up staging of piles and trestles have all been employed, also iron staging, which can be rapidly erected and moved from site to site. The most ordinary type of staging consists of timber piles at nearly equal distances of 20 ft. to 30 ft., carrying a timber platform, on which the bridge is erected. Sometimes a wide space is left for navigation, and the platform at this part is carried by a timber and iron truss. When the headway is great or the river deep, timber-braced piers or clusters of piles at distances of 50 ft. to 100 ft. may be used. These carry temporary trusses of timber or steel. The Kuilenburg Bridge in Holland, which has a span of 492 ft., was erected on a timber staging of this kind, containing 81,000 cubic feet of timber and 5 tons of bolts. The bridge superstructure weighed 2150 tons, so that 38 cubic feet of timber were used per ton of superstructure.

(2) The Britannia and Conway Bridges were built on staging on shore, lifted by pontoons, floated out to their position between the piers, and lastly lifted into place by hydraulic presses. The Moerdyk Bridge in Holland, with 14 spans of 323 ft., was erected in a similar way. The convenience of erecting girders on shore is very great, but there is some risk in the floating operations and a good deal of hauling plant is required.

(3) If a bridge consists of girders continuous over two or more spans, it may be put together on the embankment at one end and rolled over the piers. In some cases hauling tackle is used, in others power is applied by levers and ratchets to the rollers on which the girders travel. In such rolling operations the girder is subjected to straining actions different from those which it is intended to resist, and parts intended for tension may be in compression; hence it may need to be stiffened by timber during rolling. The bending action on the bottom boom in passing over the rollers is also severe. Modifications of the system have been adopted for bridges with discontinuous spans. In narrow ravines a bridge of one span may be rolled out, if the projecting end is supported on a temporary suspension cable anchored on each side. The free end is slung to a block running on the cable. If the bridge is erected when the river is nearly dry a travelling stage may be constructed to carry the projecting end of the girder while it is hauled across, the other end resting on one abutment. Sometimes a girder is rolled out about one-third of its length, and then supported on a floating pontoon.

(4) Some types of bridge can be built out from the abutments, the completed part forming an erecting stage on which lifting appliances are fixed. Generally, in addition, wire cables are stretched across the span, from which lifting tackle is suspended. In bridges so erected the straining action during erection must be studied, and material must be added to resist erecting stresses. In the case of the St Louis Bridge, half arches were built out on either side of each pier, so that the load balanced. Skeleton

towers on the piers supported chains attached to the arched ribs at suitable points. In spite of careful provision, much difficulty was experienced in making the connexion at the crown, from the expansion due to temperature changes. The Douro Bridge was similarly erected. The girders of the side spans were rolled out so as to overhang the great span by 105 ft., and formed a platform from which parts of the arch could be suspended. Dwarf towers, built on the arch ring at the fifth panel from either side, helped to support the girder above, in erecting the centre part of the arch (Seyrig, *Proc. Inst. C. E.* lxiii. p. 177). The great cantilever bridges have been erected in the same way, and they are specially adapted for erection by building out. (W. C. U.)

Bridgeton, capital of Cumberland county, New Jersey, U.S.A., situated in 39° 26' N. lat. and 74° 14' W. long., in the southern part of the state, on Cohansey Creek, which is tidal and navigable at this point. It is entered by two railways, the Central of New Jersey and the West Jersey and Southern. Population (1880), 8722; (1890), 11,424; (1900), 13,913.

Bridgwater, a municipal borough (extended in 1896), seaport, and market town in the Bridgwater parliamentary division of Somersetshire, England, 12 miles N.E. of Taunton by rail, on the Parret. Recent erections are a corn exchange and waterworks; the infirmary has been enlarged. The value of foreign and colonial imports in 1900 was £104,827; of exports of produce and manufactures of the United Kingdom, £5682. The tonnage entered in 1900 was 162,626 (of which 148,870 tons was coasting); the tonnage cleared was 159,889 (of which 157,640 tons was coasting). The registered shipping in 1901 was 90 sailing vessels of 5724 tons, and 10 steamers of 499 tons. Population on the enlarged area (1891), 13,264; (1901), 15,209.

Bridport, a municipal borough, seaport, and market town in the Western parliamentary division (since 1885) of Dorsetshire, England, 18 miles W. of Dorchester, on the Brit, and a branch of the Great Western railway. Area, 571 acres. Population (1881), 6795; (1891), 6611; (1901), 5710.

Brieg, a town of Prussia, province of Silesia, on the Oder, 26 miles S.E. from Breslau, by the railway to Beuthen. It is an industrial place, manufacturing cigars, millstones, ribbons, leather, machinery, paper, and sugar. The castle (begun 1544) is now used as a military store. Population (1885), 18,899; (1895), 21,164.

Brighouse, a municipal borough (1893) in the Elland parliamentary division of the West Riding of Yorkshire, England, 4 miles N.E. of Huddersfield by rail, on the river Calder. It is governed by a mayor, 8 aldermen, and 24 councillors. There are a technical school, a theatre and opera-house, and a public library, opened in 1898 in commemoration of Queen Victoria's Diamond Jubilee. The corporation owns gas, water, and electric-lighting works, but a new scheme of electric lighting has been adopted. Extensive sewage works were commenced in 1896. Population of municipal borough area (1891), 20,666; (1901), 21,735.

Bright, Sir Charles Tilston (1832-1888), telegraph engineer, the youngest son of Mr Brailsford Bright, was born on 8th June 1832, at Wanstead. He was employed from very early youth in telegraph work. At the age of twenty he became engineer to the Magnetic Telegraph Company, and in that capacity—the telegraphs had not at that time been taken over by the State—superintended the laying of lines in various parts of Great Britain. He was also working out in conjunction with his brother many valuable telegraphic inventions. In 1853 he laid the first submarine cable between England and Ireland. His experiments soon convinced him of the practicability of signalling electrically between the British Isles and

America, and though the very idea was regarded as absurd by some of the leading authorities of the day, with the aid of friends he raised the money with which to make the attempt. The result was the first Atlantic cable—that of 1858. As is well known, this, regarded as a means of practical communication, had only a very limited success, and largely on account of the ill-treatment to which it was subjected by the ignorance of the operators its useful life was a very brief one. It was, however, quite sufficient to prove the general principle that electrical signals can be sent for thousands of miles under the sea. Subsequently, Sir Charles Bright himself supervised the laying of submarine cables in almost every region of the world. He died on 3rd May 1888, at Abbey Wood, near London.

Bright, John (1811-1889), British manufacturer, political economist, and statesman, was born at Rochdale on 16th November 1811. His father, Jacob Bright, was a much respected member of the Society of Friends, who had started a cotton-mill at Rochdale in 1809. The family had reached Lancashire by two migrations. Abraham Bright was a Wiltshire yeoman, who, early in the 18th century, removed to Coventry, where his descendants remained, and where, in 1775, Jacob Bright was born. Jacob Bright was educated at the Ackworth School of the Society of Friends, and was apprenticed to a fustian manufacturer at New Mills. He married his employer's daughter, and settled with his two brothers-in-law at Rochdale in 1802, going into business for himself seven years later. His first wife died without children, and in 1809 he married Martha Wood, daughter of a tradesman of Bolton-le-Moors. She had been educated at Ackworth school, and was a woman of great strength of character and refined taste. There were eleven children of this marriage, of whom John Bright was the second, but the death of his elder brother in childhood made him the eldest son. He was a delicate child, and was sent as a day-scholar to a boarding-school near his home, kept by Mr William Littlewood. A year at the Ackworth school, two years at a school at York, and a year and a half at Newton, near Clitheroe, completed his education. He learned, he himself said, but little Latin and Greek, but acquired a great love of English literature, which his mother fostered, and a love of outdoor pursuits—especially fishing, which became his chief relaxation in later years. In his sixteenth year he entered his father's mill, and in due time became a partner in the business. Two agitations were then going on in Rochdale—the first (in which Jacob Bright was a leader) in opposition to a local church-rate, and the second for parliamentary reform, by which Rochdale successfully claimed to have a member allotted to it under the Reform Bill. In both these movements John Bright took part. He was an ardent Non-conformist, proud to number among his ancestors John Gratton, a friend of George Fox, and one of the persecuted and imprisoned preachers of the Society of Friends. His political interest was probably first kindled by the Preston election in 1830, in which Lord Stanley, after a long struggle, was defeated by "Orator" Hunt. But it was as a member of the Rochdale Juvenile Temperance Band that he first learned public speaking. These young men went out into the villages, borrowed a chair of a cottager, and spoke from it at open-air meetings. In Mrs John Mills's life of her husband is an account of John Bright's first extempore speech. It was at a temperance meeting. Bright got his notes muddled, and broke down. The chairman gave out a temperance song, and during the singing told Bright to put his notes aside and say what came into his mind. Bright obeyed, began with much hesitancy, but found his tongue and made an

excellent address. On some early occasions, however, he committed his speech to memory. In 1832 he called on the Rev. John Aldis, an eminent Baptist minister, to accompany him to a local Bible meeting. Mr Aldis described him as a slender, modest young gentleman, who surprised him by his intelligence and thoughtfulness, but who seemed nervous as they walked to the meeting together. At the meeting he made a stimulating speech, and on the way home asked for advice. Mr Aldis counselled him not to learn his speeches, but to write out and commit to memory certain passages and the peroration. Bright took the advice, and acted on it all his life.

This "first lesson in public speaking," as Bright called it, was given in his twenty-first year, but he had not then contemplated entering on a public career. He was a fairly prosperous man of business, very happy in his home, and always ready to take part in the social, educational, and political life of his native town. He was one of the founders of the Rochdale Literary and Philosophical Society, took a leading part in its debates, and on returning from a holiday journey in the East, gave the society

JOHN BRIGHT.
(From a photograph by Elliott and Fry.)

a lecture on his travels. He first met Richard Cobden in 1836 or 1837. Cobden was an alderman of the newly-formed Manchester corporation, and Bright went to ask him to speak at an education meeting in Rochdale. "I found him," said Bright, "in his office in Mosley Street, introduced myself to him, and told him what I wanted." Cobden consented, and at the meeting was much struck by Bright's short speech, and urged him to speak against the Corn Laws. His first speech on the Corn Laws was made at Rochdale in 1838, and in the same year he joined the Manchester Provisional Committee which in 1839 founded the Anti-Corn Law League. He was still only the local public man, taking part in all public movements, especially in opposition to Mr Feilden's proposed factory legislation, and to the Rochdale church-rate. In 1839 he built the house which he called "One Ash," and married Elizabeth, daughter of Jonathan Priestman of Newcastle-on-Tyne. In November of the same year there was a dinner at Bolton to Mr Paulton, who had just returned from a successful Anti-Corn Law tour in Scotland. Among the speakers were Cobden and Bright, and the dinner is memorable as the first occasion on which the two future leaders appeared together on a Free Trade platform. Bright is described by the historian of the League as "a young man then appearing for the first time in any meeting out of his own town, and giving evidence, by his energy and by his grasp of the subject, of his capacity

soon to take a leading part in the great agitation." But his call had not yet come. In 1840 he led a movement against the Rochdale church-rate, speaking from a tombstone in the churchyard, where it looks down on the town in the valley below. A very happy married life at home contented him, and at the opening of the Free Trade Hall in January 1840 he sat with the Rochdale deputation, undistinguished in the body of the meeting. A daughter, Helen, was born to him; but his young wife, after a long illness, died of consumption in September 1841. Three days after her death at Leamington, Cobden called to see him. "I was in the depths of grief," said Bright, when unveiling the statue of his friend at Bradford in 1877, "I might almost say of despair, for the life and sunshine of my house had been extinguished." Cobden spoke some words of condolence, but "after a time he looked up and said, 'There are thousands of homes in England at this moment where wives, mothers, and children are dying of hunger. Now, when the first paroxysm of your grief is past, I would advise you to come with me, and we will never rest till the Corn Laws are repealed.' I accepted his invitation," added Bright, "and from that time we never ceased to labour hard on behalf of the resolution which we had made." At the general election in 1841 Cobden was returned for Stockport, and in 1843 Bright was the Free Trade candidate at a by-election at Durham. He was defeated, but his successful competitor was unseated on petition, and at the second contest Bright was returned. He was already known in the country as Cobden's chief ally, and was received in the House of Commons with a suspicion and hostility even greater than had met Cobden himself. In the Anti-Corn Law movement the two speakers were the complements and correlatives of each other. Cobden had the calmness and confidence of the political philosopher, Bright had the passion and the fervour of the popular orator. Cobden did the reasoning, Bright supplied the declamation, but like Demosthenes he mingled argument with appeal. No orator of modern times rose more rapidly to a foremost place. He was not known beyond his own borough when Cobden called him to his side in 1841, and he entered Parliament towards the end of the session of 1843 with a formidable reputation as an agitator. He had been all over England and Scotland addressing vast meetings and, as a rule, carrying them with him; he had taken a leading part in a conference held by the Anti-Corn Law League in London, had led deputations to the duke of Sussex, to Sir James Graham, then Home Secretary, and to Lord Ripon and Mr Gladstone, the Secretary and Under Secretary of the Board of Trade; and he was universally recognized as the chief orator of the Free Trade movement. Wherever "John Bright of Rochdale" was announced to speak, vast crowds assembled. He had been so announced, for the last time, at the first great meeting in Drury Lane Theatre on 15th March 1843; henceforth his name was enough. He took his seat in the House of Commons as one of the members for Durham on 28th July 1843, and on 7th August delivered his maiden speech in support of a motion by Mr Ewart for reduction of import duties. He was there, he said, "not only as one of the representatives of the city of Durham, but also as one of the representatives of that benevolent organization, the Anti-Corn Law League." A member who heard the speech described Bright as "about the middle size, rather firmly and squarely built, with a fair, clear complexion, and an intelligent and pleasing expression of countenance. His voice is good, his enunciation distinct, and his delivery free from any unpleasant peculiarity or mannerism." He wore the usual Friend's coat, and was regarded with much interest and hostile curiosity on both sides of the House.

Mr Ewart's motion was defeated, but the movement of which Cobden and Bright were the leaders continued to spread. In the autumn the League resolved to raise £100,000; an appeal was made to the agricultural interest by great meetings in the farming counties, and in November the *Times* startled the world by declaring, in a leading article, "The League is a great fact. It would be foolish, nay, rash, to deny its importance." In London great meetings were held in Covent Garden Theatre, at which William Johnson Fox was the chief orator, but Bright and Cobden were the leaders of the movement. Bright publicly deprecated the popular tendency to regard Cobden and himself as the chief movers in the agitation, and Cobden told a Rochdale audience that he always stipulated that he should speak first, and Bright should follow. His "more stately genius," as Mr John Morley calls it, was already making him the undisputed master of the feelings of his audiences. In the House of Commons his progress was slower. Cobden's argumentative speeches were regarded more sympathetically than Bright's more rhetorical appeals, and in a debate on Villiers's annual motion against the Corn Laws Bright was heard with so much impatience that he was obliged to sit down. In the next session (1845) he moved for an inquiry into the operation of the Game Laws. At a meeting of county members earlier in the day Peel had advised them not to be led into discussion by a violent speech from the member for Durham, but to let the committee be granted without debate. Bright was not violent, and Cobden said that he did his work admirably, and won golden opinions from all men. The speech established his position in the House of Commons. In this session Bright and Cobden came into opposition, Cobden voting for the Maynooth Grant and Bright against it. On only one other occasion—a vote for South Kensington—did they go into opposite lobbies, during twenty-five years of parliamentary life. In the autumn of 1845 Bright retained Cobden in the public career to which Cobden had invited him four years before. Bright was in Scotland when a letter came from Cobden announcing his determination, forced on him by business difficulties, to retire from public work. Bright replied that if Cobden retired the mainspring of the League was gone. "I can in no degree take your place," he wrote. "As a second I can fight, but there are incapacities about me, of which I am fully conscious, which prevent my being more than second in such a work as we have laboured in." A few days later he set off for Manchester, posting in that wettest of autumns through "the rain that rained away the Corn Laws," and on his arrival got his friends together, and raised the money which tided Cobden over the emergency. The crisis of the struggle had come. Peel's budget in 1845 was a first step towards Free Trade. The bad harvest and the potato disease drove him to the repeal of the Corn Laws, and, at a meeting in Manchester on 2nd July 1846, Cobden moved and Bright seconded a motion dissolving the League. A library of twelve hundred volumes was presented to Bright as a memorial of the struggle.

Bright married, in June 1847, Miss Margaret Elizabeth Leatham, of Wakefield, by whom he had seven children, Mr John Albert Bright being the eldest. In the succeeding July he was elected for Manchester, with Mr Milner Gibson, without a contest. In the new Parliament, as in the previous session, he opposed legislation restricting the hours of labour, and, as a Nonconformist, spoke against clerical control of national education. In 1848 he voted for Hume's household suffrage motion, and introduced a Bill for the repeal of the Game Laws. When Lord John Russell brought forward his Ecclesiastical Titles Bill, Bright opposed it as "a little, paltry, miserable measure,"

and foretold its failure. In this Parliament he spoke much on Irish questions. In a speech in favour of the Government Bill for a rate in aid in 1849, he won loud cheers from both sides, and was complimented by Disraeli for having sustained the reputation of that assembly. From this time forward he had the ear of the House, and took effective part in the debates. He spoke against capital punishment, against church rates, against flogging in the army, and against the Irish Established Church. He supported Cobden's motion for the reduction of public expenditure, and in and out of Parliament pleaded for peace. In the election of 1852 he was again returned for Manchester on the principles of free trade, electoral reform, and religious freedom. But war was in the air, and the most impassioned speeches he ever delivered were addressed to this Parliament in fruitless opposition to the Crimean War. Neither the House nor the country would listen. "I went to the House on Monday," wrote Macaulay in March 1854, "and heard Bright say everything I thought." His most memorable speech, the greatest he ever made, was delivered on 23rd February 1855. "The angel of death has been abroad throughout the land. You may almost hear the beating of his wings," he said, and concluded with an appeal to the Prime Minister that moved the House as it had never been moved within living memory. There was a tremor in Bright's voice in the touching parts of his great speeches which stirred the feelings even of hostile listeners. It was noted for the first time in this February speech, but the most striking instance was in a speech on Mr Osborne Morgan's Burials Bill in April 1875, in which he described a Quaker funeral, and protested against the "miserable superstition of the phrase, 'buried like a dog.'" "In that sense," he said, "I shall be buried like a dog, and all those with whom I am best acquainted, whom I best love and esteem, will be 'buried like a dog.' Nay more, my own ancestors, who in past time suffered persecution for what is now held to be a righteous cause, have all been buried like dogs, if that phrase is true." The tender, half-broken tones in which these words were said, the inexpressible pathos of his voice and manner, were never forgotten by those who heard that Wednesday morning speech.

Bright was disqualified by illness during the whole of 1856 and 1857. In Palmerston's penal dissolution in the latter year, Bright was rejected by Manchester, but in August, while ill and absent, Birmingham elected him without a contest. He returned to Parliament in 1858, and in February seconded the motion which threw out Lord Palmerston's government. Lord Derby thereupon came into office for the second time, and Bright had the satisfaction of assisting in the passing of two measures which he had long advocated, the admission of Jews to Parliament and the transfer of the government of India from the East India Company to the Crown. He was now restored to full political activity, and in October addressed his new constituents, and started a movement for parliamentary reform. He spoke at great gatherings at Edinburgh, Glasgow, Bradford, and Manchester, and his speeches filled the papers. For the next nine years he was the protagonist of Reform. Towards the close of the struggle he told the House of Commons that a thousand meetings had been held, that at every one the doors were open for any man to enter, yet that an almost unanimous vote for reform had been taken. In the debates on the Reform Bills submitted to the House of Commons from 1859 to 1867, Bright's was the most influential voice. He rebuked Lowe's "Botany Bay view," and described Horsman as retiring to his "cave of Adullam," and hooking in Lowe. "The party of two," he said, "reminds me of the Scotch terrier, which was so covered with hair that you

could not tell which was the head and which was the tail." These and similar phrases, such as the excuse for withdrawing the Reform Bill in the year of the great budget of 1860—"you cannot get twenty waggons at once through Temple Bar"—were in all men's mouths. It was one of the triumphs of Bright's oratory that it constantly produced these popular cries. The phrase "a free breakfast table" was his; and on the rejection of Forster's Compensation for Disturbance Bill he used the phrase as to Irish discontent, "Force is not a remedy."

During his great reform agitation Bright had vigorously supported Cobden in the negotiations for the treaty of commerce with France, and had taken, with his usual vehemence, the side of the North in the discussions in England on the American civil war. In March 1865 Cobden died, and Bright told the House of Commons he dared not even attempt to express the feelings which oppressed him, and sat down overwhelmed with grief. Their friendship was one of the most characteristic features of the public life of their time. "After twenty years of intimate and almost brotherly friendship with him," said Bright, "I little knew how much I loved him till I had lost him." In June 1865 Parliament was dissolved, and Bright was returned for Birmingham without opposition. Palmerston's death in the early autumn brought Lord John Russell into power, and for the first time Bright gave his support to the Government. Russell's fourth Reform Bill was introduced, was defeated by the Adullamites, and the Derby-Disraeli ministry was installed. Bright declared Lord Derby's accession to be a declaration of war against the working classes, and roused the great towns in the demand for reform. Bright was the popular hero of the time. As a political leader the winter of 1866-67 was the culminating point in his career. The Reform Bill was carried with a clause for minority representation, and in the autumn of 1868 Bright, with two Liberal colleagues, was again returned for Birmingham. Mr Gladstone came into power with a programme of Irish reform in church and land such as Bright had long urged, and he accepted the post of President of the Board of Trade. He thus became a member of the Privy Council, with the title of Right Honourable, and from this time forth was a recognized leader of the Liberal party in Parliament and in the country. He made a great speech on the second reading of the Irish Church Bill, and wrote a letter to the House of Lords, in which he said, "In harmony with the nation they may go on for a long time, but throwing themselves athwart its course they may meet with accidents not pleasant for them to think of." He also spoke strongly in the same session in favour of the bill permitting marriage with a deceased wife's sister. The next session found him disqualified by a severe illness, which caused his retirement from office at the end of the year, and kept him out of public life for four years. In August 1873 Mr Gladstone reconstructed his Cabinet, and Bright returned to it as Chancellor of the Duchy of Lancaster. But his hair had become white, and though he spoke again with much of his former vigour, he was now an old man. In the election in January 1874 Bright and his colleagues were returned for Birmingham without opposition. When Mr Gladstone resigned the leadership of his party in 1875, Bright was chairman of the party meeting which chose Lord Hartington as his successor. He took a less prominent part in political discussion, till the Eastern Question brought Great Britain to the verge of war with Russia, and his old energy flamed up afresh. In the debate on the Vote of Credit in February 1878, he made one of his impressive speeches, urging the Government not to increase the difficulties manufacturers had in finding employment for their workpeople by any single

word or act which could shake confidence in business. The debate lasted five days. On the fifth day a telegram from Mr Layard was published announcing that the Russians were nearing Constantinople. The day, said the *Times*, "was crowded with rumours, alarms, contradictions, fears, hopes, resolves, uncertainties." In both Houses Mr Layard's despatch was read, and in the excited Commons Mr Forster's resolution opposing the Vote of Credit was withdrawn. Bright, however, distrusted the ambassador at the Porte, and gave reasons for doubting the alarming telegram. While he was speaking a note was put into the hands of Sir Stafford Northcote, and when Bright sat down he read it to the House. It was a confirmation from the Russian prime minister of Bright's doubts: "There is not a word of truth in the rumours which have reached you." At the general election in 1880 he was re-elected at Birmingham, and joined Mr Gladstone's new government as Chancellor of the Duchy of Lancaster. For two sessions he spoke and voted with his colleagues, but after the bombardment of the Alexandria forts he left the ministry and never held office again. He felt most painfully the severance from his old and trusted leader, but it was forced on him by his conviction of the danger and impolicy of foreign entanglements. He, however, gave a general support to Mr Gladstone's government. In 1883 he took the chair at a meeting of the Liberation Society in Mr Spurgeon's chapel; and in June of that year was the object of an unparalleled demonstration at Birmingham to celebrate his twenty-five years of service as its representative. At this celebration he spoke strongly of "the Irish rebel party," and accused the Conservatives of "alliance" with them, but withdrew the imputation when Sir Stafford Northcote moved that such language was a breach of the privileges of the House of Commons. At a banquet to Lord Spencer he accused the Irish members of having "exhibited a boundless sympathy for criminals and murderers." He refused in the House of Commons to apologize for these words, and was supported in his refusal by both sides in the House. At the Birmingham election in 1885 he stood for the Central Division of the redistributed constituency; he was opposed by Lord Randolph Churchill, but was elected by a large majority. In the new Parliament he voted against the Home Rule Bill, and it was generally felt that in the election of 1886 which followed its defeat, when he was re-elected without opposition, his letters told with fatal effect against the Home Rule Liberals. His contribution to the discussion was a suggestion that the Irish members should form a Grand Committee to which every Irish bill should go after first reading. The break-up of the Liberal party filled him with gloom. His last speech at Birmingham was on 29th March 1888 at a banquet to celebrate Mr Chamberlain's return from his Peace Mission to the United States. He spoke of Imperial Federation as "a dream and an absurdity." In May his illness returned, he took to his bed in October and died on 27th March 1889. He was buried in the graveyard of the meeting-house of the Society of Friends in Rochdale.

Bright had much literary and social recognition in his later years. In 1882 he was elected Lord Rector of the University of Glasgow, and Dr Dale wrote of his Rectorial address, "It was not the old Bright." "I am weary of public speaking," he had told Dr Dale; "my mind is almost a blank." He was given an honorary degree of the University of Oxford in 1886, and in 1888 a statue of him was erected at Birmingham. Lord Salisbury said of him, and it sums up his character as a public man, "He was the greatest master of English oratory that this generation—I may say several generations—has seen. . . . At a time when much speaking has depressed, has almost ex-

terminated eloquence, he maintained that robust, powerful, and vigorous style in which he gave fitting expression to the burning and noble thoughts he desired to utter."

No full biography of Bright has been published since his death. The fullest is *The Life and Speeches of the Right Hon. John Bright, M.P.*, by GEORGE BARNETT SMITH, 2 vols. 8vo., 1881. See also *The Life of John Bright, M.P.*, by JOHN M'GILCHRIST, in Cassell's Representative Biographies, 1868.—*John Bright*, by C. A. VINCE, 1898.—*Speeches on Parliamentary Reform by John Bright, M.P.*, revised by himself, 1866.—*Speeches on Questions of Public Policy*, by JOHN BRIGHT, M.P., edited by J. E. Thorold Rogers, 2 vols. 8vo., 1868.—*Public Addresses*, edited by J. E. Thorold Rogers, 8vo., 1879.—*Public Letters of the Right Hon. John Bright, M.P.*, collected by H. J. Leech, 1885. (p. w. c.)

Brighton, a municipal, county (1888), and parliamentary borough of England, on the English Channel, 50½ miles by rail S. of London, 44 miles E. of Portsmouth, 34 miles W. of Hastings, in the county of Sussex, on the London, Brighton, and South Coast railway. The municipal borough of Hove, with which in 1893 was incorporated the parish of Aldrington, adjoins the county borough of Brighton. The parish of Hove forms part of the parliamentary borough of Brighton, but the parish of Aldrington is a part of the Mid or Lewes parliamentary division of Sussex. Preston to the north, formerly a distinct suburb, is now absorbed in the municipal and parliamentary borough of Brighton. Practically one town, Brighton and Hove extend 4 miles, east to west, along the coast, fronted for a length of 3 miles, by a massive sea-wall, 60 feet high, 23 feet thick at the base, and 3 feet at the summit, and a fashionable promenade. Till 1894, when its boundaries were altered, Brighton was distributed into 7, but since then into 14 wards, under the government of a mayor, 14 aldermen, and 42 councillors. Incorporated by Royal Charter 1898, Hove is under a mayor, 10 aldermen, and 30 councillors. In continuous fast growth, Brighton now comprises more than 700 streets and squares. Recent improvements include the widening of King's Road (1888); improvements effected on the Marine Parade (1890); an electric railway along the beach; a railway (opened 1887) from Brighton to Devil's Dyke, 5½ miles distant; electric tramways (1901); "railway in the sea," from Kemp Town to Rottingdean, &c. The Corporation are erecting at Portslade, at a total cost of about £270,000, a large power station to enable them to meet the increasing demand for electricity in the borough. Extension works for augmenting the existing supply of water are being carried out at an estimated cost of over £100,000. There are 35 churches, and over 50 dissenting chapels. The more recent churches include St Paul's, with elaborate decorations, completed 1885; Trinity church, restored and partly rebuilt 1887; St Andrew's, St Nicholas' (the old parish church, dating from the 12th century), restored 1884; All Saints', the new parish church of Hove (1891), costing £19,400; St Augustine's (1896); the church of St Philip in Aldrington parish, erected since 1893, but still incomplete. The Brighton municipal school of science and technology, costing about £33,000, was opened in 1898. The same year the municipal school of science and art, erected in 1876 at a cost of £11,000, was enlarged and re-adapted, and St Mary's Hall (1836), for the education of daughters of poor clergymen, was also enlarged. Brighton grammar school now includes chemical and physical laboratories and a workshop, attended by between 300 and 400 boys. The Victoria lending library (1889) was rebuilt in 1901 at a cost of about £38,000, and the Hove free library was opened in 1892. Among the more recent erections are the terminus of the London, Brighton, and South Coast railway, covering 20 acres, entirely reconstructed in 1887; the west pier (1886),

lately enlarged and extended; a new pier, completed in 1900, 1700 feet long, with a three-deck landing-stage at its head, near the site of the chain pier, which was washed away in 1896; the town hall, entirely rebuilt in 1899 at a cost of nearly £48,000; the town hall of Hove (1882), costing £40,000; the new parochial offices (1894); the Booth collection of (1400) British birds (1893); the Victoria (1888), Cobden Road (1894), and Hove (1894) public baths. The wholesale and retail fruit and flower market was rebuilt in 1901 at a cost of over £10,000. Places of entertainment are a theatre, rebuilt 1894; another theatre (1891), rebuilt 1895; a variety theatre, reconstructed 1892 at a cost of £30,000; a concert hall (1892); an alhambra (1888). In 1876 the aquarium was enlarged, and in 1878 its roof was laid out as a terrace garden. Under the powers of their Act of 1901 the Corporation have purchased the aquarium, and are remodelling and rearranging the building, in order to carry it on as a high-class concert hall and winter garden. The hospitals comprise a fever hospital and sanatorium (1898); a children's hospital (1881); throat and ear hospital (1878), re-erected 1898. There are several public parks and recreation grounds. The Corporation acquired in 1900, for the purposes of a park, 180 acres of land on the east side of Ditchling Road. The mackerel and herring fishery is extensive. There are 4 daily, 1 tri-weekly, and 9 weekly newspapers. Area of municipal borough of Brighton in 1901, 2620 acres. Population (1881), 107,546; (1891), 115,873; (1901), 123,478. Area of municipal borough of Hove in 1901, 1694½ acres; population (1881), 20,804; (1891), 26,097; (1901), 36,542. Area of parliamentary borough in 1891, 3715 acres; population (1881), 128,440; (1891), 142,129; (1901), 153,691.

Brighton, a watering-place in Victoria, Australia, in the county of Bourke, on the east shore of Port Phillip Bay, 7½ miles S.E. from Melbourne, of which it is practically a suburb connected by rail. Population (1881), 4755; (1901), 10,029.

Brin, Benedetto (1833-1898), Italian naval administrator, was born at Turin, 17th May 1833, and, until the age of 40, worked with distinction as a naval engineer. In 1873, Admiral Saint-Bon, Minister of Marine, appointed him under-secretary of state. The two men completed each other; Saint-Bon conceived a type of ship, Brin made the plans and directed its construction. On the advent of the Left to power in 1876, Brin was appointed Minister of Marine by Depretis, a capacity in which he continued the programme of Saint-Bon, while enlarging and completing it in such way as to form the first organic scheme for the development of the Italian fleet. The huge warships *Italia* and *Dandolo* were his work, though he afterwards abandoned their type in favour of smaller and faster vessels of the *Varese* and the *Garibaldi* class. By his initiative Italian naval industry, almost non-existent in 1873, made rapid progress. During his eleven years' ministry (1876-78 with Depretis, 1884-91 with Depretis and Crispi, 1896-98 with Rudini), he succeeded in creating large private shipyards, engine works, and metallurgical works for the production of armour, steel plates, and guns. In 1892 he entered the Giolitti cabinet as Minister for Foreign Affairs, accompanying, in that capacity, the king and queen of Italy to Potsdam, but showed weakness towards France on the occasion of the massacre of Italian workmen at Aigues-Mortes. He died on 24th May 1898, while Minister of Marine in the Rudini Cabinet. He, more than any other man, must be regarded as the practical creator of the Italian navy. (H. W. S.)

Brindaban, a town of British India, in the Muttra district of the North-West Provinces, on the right bank of the Jumna, 6 miles N. of Muttra. Population, about 26,000. The municipal income in 1897-98 was Rs.20,931. Brindaban is one of the most popular places of pilgrimage in India, being associated with the cult of Krishna as a shepherd. It contains handsome temples, bathing stairs, tanks, and wells.

Brindisi, a seaport town and archiepiscopal see of the province of Lecce, Apulia, Italy, on the shore of the Adriatic, near the S.E. extremity of the kingdom, 346 miles by rail from Ancona. The port has been gradually, but slowly, improved and dredged year by year, the intention being to go on with the work until there is a depth of 30 ft. all over the inner harbour; the eastern arm was dredged to 13 ft. in 1898.

In July 1898 the Peninsular and Oriental Company (who first used Brindisi as a port of embarkation in December 1870) began to start their main line boats from Marseilles instead of from Brindisi, chiefly with the view of decreasing the cost of the overland railway journey from Calais. But at Brindisi they substituted an express service of small boats for Port Said, principally to carry the mails. The Peninsular and Oriental Company's service from Venice *via* Brindisi to Port Said was discontinued in March 1900. But there are mail services to Greek ports and to Constantinople. During the five years 1893-97 an average of 14,728 passengers sailed annually from this port; in 1898 the number fell to 2359. Adding to the mail boats the tonnage and number of the trading ships, we find that the port was cleared by an average of 1335 vessels of 1,385,000 tons annually during the years 1888-99. In 1898 the British entries numbered 155 vessels of 362,700 tons, but in 1899 only 128 vessels of 153,000 tons. The exports average £326,100 (£253,000 in 1899) annually, and the imports £300,100 (£298,400 in 1899). There is not much industrial activity. As regards the public buildings, the cathedral has been recently restored, the castle of Frederick II. is now a convict prison, and the baptistry of San Giovanni has been converted into a museum. There is also a new theatre (1899). Population, about 20,000.

Brionian Islands, The, in the Gulf of Venice, off the Istrian coast, from which they are separated by the narrow Canale di Jasana. They belong to Austria and are twelve in number. Up to a recent period they were chiefly noted for their quarries (on S. Girolamo and Brion minore), which have been worked for centuries and have supplied material not only for the palaces and bridges of Venice and the whole Adriatic coast, but latterly for Vienna and Berlin also. As they command the entrance to the naval harbour of Pola, a strong fortress, "Fort Tegethoff," has been erected on the largest of them, together with minor fortifications on some of the others. The islands are inhabited by about 100 Italian quarrymen.

Brisbane, the capital city of Queensland, Australia, about 25 miles from the mouth of the river Brisbane, in 27° 28' 3" S. lat., 153° 1' 55" E. long. The population has increased greatly since 1875, largely on account of the rapid growth of outlying suburbs; in 1901 the population of Brisbane metropolitan area was 119,907. The population of the city proper in 1901 was estimated at 28,830 persons, and of South Brisbane at 25,485. The most important suburbs are Kangaroo Point, Fortitude Valley, New Farm, Red Hill, Paddington, Milton, Toowong, Breakfast Creek, Bulimba, Woollonyabba, Highgate, and Indooroopilly. The city is mostly built on a series of hills rising from the river, but some portions of it, such as Woollonyabba and South Brisbane, are built on low-lying flats, and have from time to time been much damaged by floods. The plan of Brisbane is not in accordance with modern principles, and the streets are comparatively narrow, but they are well paved and fairly well lighted with gas. The public buildings are of an unusually fine order of architecture, such structures as the Parliament Houses, the new block of public offices, the Custom House, the General Post

Office, Government House (the residence of the Sovereign's representative), the General Museum, and the Supreme Court being conspicuous. Besides these there are many fine civic, commercial, religious, and private buildings. Both Brisbane proper and South Brisbane have town halls, and there are an Anglican pro-cathedral, a Roman Catholic cathedral, two grammar schools (one for boys and one for girls), a hospital, an opera house and two theatres, two museums (one attached to the mines department and the other to the agricultural department), and a national art gallery, with an annual government grant of £500, situated in the town-hall buildings. The old Victoria iron bridge connecting North and South Brisbane was swept away in the great floods of 1893. A new bridge was commenced in 1894, and completed in 1897, at a cost of £110,000. At this point the river is a quarter of a mile wide. The city is well provided with parks and open spaces. The largest is the Victoria Park, and there are five others besides the Botanical Gardens, and the gardens of the Acclimatization Society, wherein tropical vegetation is cultivated. The mean temperature of Brisbane during December, January, and February is about 76°; during June, July, and August, about 60°. The average rainfall over a period of 35 years was 50·01 inches.

The municipal government of Brisbane, and also of South Brisbane, is in the hands of a corporation consisting of a mayor and ten aldermen, representing five wards; the suburbs are under the control of shire councils and divisional boards. The sanitary arrangements of Brisbane are not worthy of so fine a city, but there is a splendid gravitation system of water-supply. The united storage capacity of the various reservoirs, one of which holds 1,000,000,000 gallons and another 400,000,000 gallons, is 225,700,000 cubic feet. Electric light has been installed by private enterprise, and is largely used. By the same means the city has been provided with a most convenient tramway service worked by electric power, which runs in all directions from the centre of the city to the suburbs. There is railway communication with Sydney to the south and Rockhampton to the north, while westwards a line runs almost as far as Cunnamulla, 560 miles distant. Telegraphic communication exists between Brisbane and, among other places, the French settlement of New Caledonia, a cable to which islands is in the hands of a French company. In 1899 nearly 1800 telephones were in use. Three daily newspapers are published. Brisbane is an important trading port, and the broad river, by careful dredging, has been rendered navigable for vessels of the largest size, ships of 5000 tons being easily able to come up to the town from the mouth. It is the terminal port of the line which carries the Queensland royal mail to Europe, and a calling port for lines of steamers to China, Japan, and Canada. The various intercolonial lines also call at Brisbane on their way to northern and southern Australian ports. As regards merchant shipping, 713 vessels with cargoes of 835,355 tons entered in 1900; 716 of 819,662 tons cleared. The value of the imports in 1900 was £7,184,112; of the exports, £9,581,562. As a manufacturing centre Brisbane has not yet attained any great importance. In the metropolitan district there are a number of boot factories, employing 1500 hands; soap factories, 130 hands; preserve and pickle factories, 300 hands; breweries, 270 hands; and tanneries, 250 hands. There are also several tobacco factories and various minor industries. North Brisbane is the principal business part, but South Brisbane is rapidly growing in population and importance. (J. D. F.)

Brisson, Eugène Henri (1835—), French

statesman, was born at Bourges 31st July 1835. He followed his father's profession of advocate, and, having made himself conspicuous in opposition during the last days of the empire, was appointed deputy-mayor of Paris after its overthrow. He was elected to the Assembly in 1871 as a member of the Extreme Left, and after following a steady and consistent political course for nine years was chosen its president in 1881. He showed remarkable firmness and dignity in the discharge of his duties, and in March 1885 became prime minister upon the resignation of M. Jules Ferry; but he resigned when, after the general elections of that year, he only just obtained a majority for the vote of credit for the Tongking expedition. He remained conspicuous as a public man, took a prominent part in exposing the Panama scandals, was a powerful candidate for the presidency after the murder of President Carnot in 1894, and was again president of the chamber from 1894 to 1898. In June of the latter year he formed a Cabinet when the country was violently excited over the Dreyfus affair; his firmness and impartiality increased the respect in which he was already held by good citizens, but a chance vote on an occasion of especial excitement overthrew his ministry in October. No politician in France enjoys a higher public reputation than M. Brisson, owing to his known uprightness and austerity of character.

Bristol, a city and county in itself, municipal county (1888) and parliamentary borough, and seaport of England, on the tidal river Avon at its confluence with the Frome, 8 miles S.E. of its mouth in the Bristol Channel, 12 miles W.N.W. of Bath, 163 miles S. of Manchester, 118 miles, by the Great Western railway, W. of London, chiefly in the county of Gloucester but partly in that of Somerset. An important junction on the Great Western and Midland railways. In 1885 the parliamentary limits were extended, and the enlarged borough now returns 4 members, one for each of the four divisions. The government of the city consists of a mayor, 21 aldermen, 62 town councillors, and about 70 magistrates, together with a sheriff and other officers.

The see of Bristol was founded by Henry VIII. in 1542. In 1836 the sees of Gloucester and Bristol were united. In 1896 the sees were separated and a distinct diocese of Bristol was established. The Cathedral has been doubled in size since 1875. The Norman nave and aisles were restored in 1877; the Elder Lady Chapel and the Central Tower in 1894. About £80,000 has been spent on the Cathedral since 1861. The restoration of the parish church of St Mary Redcliff was completed in 1879 at a cost of upwards of £50,000. In the suburb of Clifton, included in the municipality of Bristol, are the churches of St Peter's (1882), All Saints' (1891), and St Anselm's (1897). There are in Bristol 18 churches of the original parishes, 24 ecclesiastical parish churches—in all 69 churches and Episcopal chapels, 6 Roman Catholic churches, besides 5 convents connected with the Cathedral at Clifton, 23 Congregational, 19 Wesleyan, 17 Baptist chapels, and numerous other dissenting places of worship. The Technical College, founded in 1885, of the Company of Merchant Venturers, supplies scientific, technical, and commercial education. University College, to which is attached the older Medical School, dates from 1876. Clifton College, opened in 1862 and incorporated in 1877, includes a physical science school with laboratories, a museum and observatory. Colston's Girls' Day School (1891) includes domestic economy and calisthenics. There are 5 grammar and collegiate schools, a Baptist College (1679), 9 endowed charity, 4 orphan, and 4 reformatory, besides numerous board and national schools. The harbour, formed in 1809 by the conversion of the Avon and a branch of the Frome into "the Float," by the cutting

of a new channel for the Avon and the formation of two basins, comprises about 63 acres of water. Altogether, the dammed-up water area, at fixed level, measures about 85 acres. In 1884 the Avonmouth and Portishead docks at the river entrance were bought up by the city. The dock gates have also been enlarged so as to admit first-class steamships and trading vessels of 2000 tons burden. The quay accommodation within the harbour is over a mile in length. Clifton Rocks railway, cut in a tunnel from the gorge of the Avon to the summit of the Clifton Rocks, was opened in 1893. The council house, fine arts academy and school of science and art, post office, and commercial rooms, have all been greatly enlarged, and recent new erections are the assize courts, a theatre seating 3500 persons, St Philip's Free Public Library, Cheltenham Road Library (1901), Colston Hall, and statues of Queen Victoria (1888), Samuel Morley (1888), Edmund Burke (1894), and Edward Colston (1895), in whose memory are held annual Colston banquets. The museum and reference library were transferred to the Corporation in 1893, in addition to which eight other libraries have been provided for the public use. Mr Vincent Stuckey Lean, who died in 1899, bequeathed to the Corporation of Bristol the sum of £50,000 for the further development of the free libraries of the city, and with especial regard to the formation and sustenance of a general reference library of a standard and scientific character. With a view to reviving interest in the once famous hot springs there, a new spa and pump-room has been opened in Clifton, where also two Established churches and a memorial tower (1897) to John Cabot, the explorer, have been erected. Among the many charitable institutions are the General Hospital, opened in 1858, and since repeatedly enlarged; Royal Hospital for sick children and women, Royal Victoria Home, and the Queen Victoria Jubilee Convalescent Home, opened by H.M. the Queen on 15th November 1899. The entire assessable value for poor rate in the union of Bristol, with a population of 55,549, was in the year 1897-98, £421,495 against £377,982 in the year 1887-88, with a population of 57,479. The amount of poor rate expended for the year 1897-98 was £34,029 against £29,300 in 1887-88. The local taxation expended by the town council of the county borough for the year 1897-98 was £183,026 against £111,190 for the year 1887-88. There are 5 daily and 5 weekly newspapers.

The principal industries are shipbuilding, ropewalks, chocolate factories, sugar refineries, tobacco mills and pipe-making, glass works, potteries, soaperies, shoe factories, leather works and tanneries, chemical works, saw mills, breweries, copper, lead, and shot works, iron works, machine works, stained paper works, anchors, chain cables, sail-cloth, buttons. A coal-field extending 16 miles south-east to Radstock avails much for Bristol manufactures.

Registered shipping in 1888—sailing vessels, 135 of 21,901 tons; steam vessels, 62 of 20,516 tons. In 1898—sailing vessels, 74 of 8925 tons; steam vessels, 87 of 31,488 tons. Ships entering port in 1888—8601 of 1,249,344 tons; clearances, 8223 of 1,246,981 tons. In 1898—entrances, 5136 of 1,254,023 tons; clearances, 5131 of 1,260,677 tons.

The following table will indicate the magnitude of the trade of Bristol :—

Imports of foreign and colonial produce for 1898—	
Grain of all sorts	£4,723,641
Sugar	886,623
Leather	341,828
Wine	142,917
Total value of imports of foreign and colonial produce for 1898	11,057,715
Against this may be set—	
Total value of imports of foreign and colonial produce for 1888	7,863,478
Exports of the produce and manufactures of the United Kingdom for 1898—	
Chemical products	£32,972
Corn, grain, meal, and flour	22,738
Metals of all sorts	873,806

Total value of exports of produce and manufactures of the United Kingdom for 1898	£1,372,815
Against this may be set :—	
Total value of exports of produce and manufactures of the United Kingdom for 1888	763,210
Gross customs revenue for 1898	1,617,220
" " 1888	914,108

Area of city and municipal borough, 11,407 acres; population (1891), 289,280; (1901), 328,842. Area of parliamentary borough, 9675 acres; population (1891), 286,231; (1901), 321,908.

Bristol, a town of Hartford county, Connecticut, U.S.A., situated in the central part of the state, includes an area of 27 square miles of hill country. It contains two villages, Bristol borough and Forestville, both on Pequannoc river, and on the New England railway. They have varied manufactures, chiefly of highly manufactured articles. Population of the town (1880), 5347; (1890), 7382; (1900), 9643; of the borough (1900), 6268.

Bristol, a borough of Bucks county, Pennsylvania, U.S.A., situated in the south-eastern part of the state, on Delaware river, and on a branch of the Pennsylvania railway, 19 miles N. of Philadelphia. Population (1880), 5273; (1890), 6553; (1900), 7104.

Bristol, capital of Bristol county, Rhode Island, U.S.A., situated on the east shore of Narragansett Bay, traversed by the New York, New Haven, and Hartford railway. The principal village, also known as Bristol, is a port of entry, with a capacious and deep harbour. It has manufactures of cotton, woollen, and rubber goods, and yards for the building of yachts, for the construction of which it is famous. Population of the town (1880), 6028; (1890), 5478; (1900), 6901.

Bristol, a city in Virginia and Tennessee, U.S.A. The state boundary follows the middle of the main street, dividing the city into two corporations, each bearing the same name. The Tennessee city is in Sullivan county; the Virginia city, formerly known as Goodson, lies within Washington county, but is independent of county jurisdiction. Bristol is situated in 36° 36' N. lat. and 82° 11' W. long., at an altitude of 1689 feet. It has some manufactures, especially of iron and tobacco. It is the site of several educational institutions, among them King's and Sullin's Colleges. Branches of the Norfolk and Western and the Southern railways join here, besides which the city is the terminus of two smaller railways. Population (1880), 3209; (1890), 6226; Virginia city (1900), 4579; Tennessee city (1900), 5271.

Bristow, Benjamin Helm (1832-1896), American lawyer and Secretary of the Treasury, was born in Elkton, Kentucky, in 1832. He received a college education, and was admitted to the bar in 1853. At the beginning of the Civil War he became lieutenant-colonel in the Union army, and afterwards was colonel of cavalry. He served throughout the war. He was state senator from 1863 to 1865; United States district attorney for the Louisville district, 1865-70; and Solicitor-General of the United States, 1870-72. President Grant nominated him Attorney-General of the United States in 1873, but the nomination was not confirmed. He was Secretary of the Treasury for two years after June 1874, when he vigorously prosecuted the whisky ring. He was an unsuccessful candidate for the Presidential nomination in 1876,

and removed in the same year to New York to practise his profession. He died in New York city on 22nd June 1896.

British Columbia, the western province of the Dominion of Canada. It is bounded to the eastward by the continental watershed in the Rocky Mountains, until this, in its north-westerly course, intersects the 120th meridian of west longitude, which is followed north to the 60th parallel, thus including within the province a part of the Peace river country to the east of the mountains. The southern boundary is formed by the 49th parallel and the strait separating Vancouver Island from the state of Washington. The northern boundary is the 60th parallel, the western, the Pacific Ocean, upon which the province fronts for about 600 miles, and the coast strip of Alaska for a farther distance of 400 miles. British Columbia is essentially a mountainous country, comprising practically the entire width of what has been designated the Cordillera or Cordilleran belt of North America between the parallels of latitude above indicated, its area has as yet been very imperfectly mapped, and many different mountain ranges are recognized under local names; but there are two ruling mountain systems, the Rocky Mountains proper on the north-east side and the coast ranges on the south-west or Pacific side. The general direction of all these ranges is fundamentally dependent upon successive foldings of the earth's crust that have occurred parallel to the corresponding portion of the border of the Pacific Ocean, and their trend is therefore from south-east to north-west. Along the south-western side of the Rocky Mountains is a very remarkable valley of considerable geological antiquity, in which several of the great rivers of the Pacific slope flow for parts of their upper courses, including the Kootenay, Columbia, Fraser, and Finlay. This valley can be traced continuously for a length of at least 800 miles. (For further details as to the geology and physical geography of British Columbia, see the article on CANADA.) One of the most important rivers of the province is the Fraser, which, rising in the Rocky Mountains, flows for a long distance to the north-west, and then turning south eventually crosses the coast ranges by a deep, cañon-like valley and empties into the Strait of Georgia, a few miles south of the city of Vancouver. The Columbia, which rises farther south in the same range, flows north for about 150 miles, and then taking a short bend to the west flows south through the Kootenay country into the United States, emptying into the Pacific near Portland in the state of Oregon. In the north-western part of the province the Skeena flows south-west into the Pacific, and still farther to the north the Stikine rises in British Columbia, but before entering the Pacific crosses the coast-strip of Alaska, of which the width has not yet been defined. The Liard, rising in the same district, flows east and falls into the Mackenzie, which empties into the Arctic Ocean. The head-waters of the Yukon are also situated in the northern part of the province. All these rivers are swift and are interrupted by rapids at frequent intervals, so that, as means of communication for commercial purposes, they are of indifferent value. Wherever lines of railway are constructed they lose whatever importance they may have held in this respect previously.

At an early stage in the Glacial period British Columbia was covered by the Cordilleran glacier, which moved south-eastwards and north-westwards, in correspondence with the ruling features of the country, from a gathering-ground situated in the vicinity of the 57th parallel. Ice from this glacier poured through passes in the coast ranges and to a lesser extent debouched upon the edge of the great plains, beyond the Rocky Mountain range. The great

valley between the coast ranges and Vancouver Island was also occupied by a glacier that moved in both directions from a central point in the vicinity of Valdez Island. The effects of this glacial action and of the long periods of erosion preceding it and of other physiographic changes connected with its passing away, have most important bearings on the distribution and character of the gold-bearing alluviums of the province.

History.—The discovery of British Columbia was made by the Spaniard Perez in 1774. With Cook's visit the geographical exploration of the coast began in 1778. Vancouver, in 1792-94, surveyed almost the entire coast of British Columbia with much of that to the north and south, for the British Government. The interior, about the same time, was entered by Mackenzie and traders of the N.W. Company, which at a later date became amalgamated with the Hudson Bay Company. In 1859, consequent on the discovery of gold and the large influx of miners, the mainland territory was erected into a separate colony under the name of British Columbia, and in 1866 this was united with Vancouver Island, under the same name. In 1859 some extension of responsible government was given to the colonies, and in 1871 British Columbia entered confederation and became part of the Dominion of Canada, sending three senators and six members of the House of Commons to the federal parliament. One of the conditions under which the colony entered the Dominion was the speedy construction of the Canadian Pacific railway, and in 1876 the non-fulfilment of this promise and the apparent indifference of the Government at Ottawa to the representations of British Columbia created strained relations, which were only ameliorated when the construction of a transcontinental road was begun. In subsequent years the founding of the city of Vancouver by the C.P.R., the establishment of the first Canadian steamship line to China and Japan, and that to Australia, together with the disputes with the United States on the subject of pelagic sealing, and the discovery of the Kootenay mining districts, have been the chief events in the history of the province.

Area and Population.—The area of British Columbia is 382,300 square miles, and its population by the census of 1891 was 98,178. Since that date this has been largely increased by the influx of miners and others, consequent upon the discovery of precious metals in the Kootenay, Columbia, and Atlin districts. Much of this is a floating population, but the opening up of the valleys by railway and new lines of steamboats, together with the settlements made in the vicinity of the Canadian Pacific railway, has resulted in a considerable increase of the permanent population. The white population comprises men of many nationalities. There is a large Chinese population, the census of 1891 giving 9000, but since that date the number has greatly increased despite the tax of \$50 per head on all Chinamen entering the seaports, and of late years many Japanese have also come in. The Japanese are as yet mainly in the towns, but the Chinese are found everywhere in the province. Great objection is taken by the white population to the increasing number of "Mongolians," and legislative efforts have been made to hinder their competition with whites in the labour markets. The Japanese do not appear to be so much disliked, as they adapt themselves to the ways of white men, but they are equally objectionable on the score of cheap labour.

The Indian population is returned at 24,973, that of the coast numbering 13,392 and of the interior 11,581. Of the total, 19,586 are professing Christians and 5387 pagans. The Indians are divided into very many tribes, under local names, but fall naturally on linguistic grounds into a few large groups. Thus the southern part of the interior is occupied by the Salish and Kootenay, and the northern interior by the Tinneh or Athapaskan people. On the coast are the Haida, Tsimshian, Kwakiatl, Nootka, and about the Gulf of Georgia various tribes related to the Salish proper.

There is no treaty with the Indians of British Columbia, as with those of the plains, for the relinquishment of their title to the land, but the Government otherwise assists them. There is an Indian superintendent at Victoria, and under him are nine agencies throughout the province to attend to the Indians—relieving their sick and destitute, supplying them with seed and implements, settling their disputes, and administering justice. The Indian

fishing stations and burial grounds are reserved, and other land has been set apart for them for agricultural and pastoral purposes. A number of schools have been established for their education; but it is questionable whether great benefit is derived from these. Though at one time a dangerous element they are now quiet and peaceable.

In 1891 there was a large disparity between the sexes in British Columbia, the figures showing 63,003 males to 35,170 females; the average size of a family being four to seven. The chief cities are Victoria, the capital, on Vancouver Island, and Vancouver on the mainland, New Westminster on the Fraser, Nanaimo on

Vancouver Island. Rossland and Nelson in West Kootenay are also places of importance.

Climate.—The subjoined figures relating to temperature and precipitation are from a table prepared by Mr. R. F. Stupart, director of the meteorological service. The station at Victoria may be taken as representing the conditions of the southern part of the coast of British Columbia, although the rainfall is much greater on exposed parts of the outer coast. Agassiz represents the Fraser delta, and Kamloops the southern interior district. The mean temperature naturally decreases to the northward of these selected stations, both along the coast and in the interior, while the precipitation increases.

Government.—The province is governed by a lieutenant-governor, appointed by the governor-general in council for five years, but subject to removal for cause, an executive council of five ministers, and a single legislative chamber. The executive council is appointed by the lieutenant-governor on the advice of the first minister, and retains office so long as it enjoys the support of a majority of the legislature. The powers of the lieutenant-governor in regard to the provincial Government are analogous to those of the governor-general in respect of the Dominion Government.

The British North America Act (1867) confederating the colonies, defines the jurisdiction of the provincial legislature as distinguished from that of the federal parliament, but within its own jurisdiction the province makes the laws for its own governance. The Act of the legislature may be disallowed, within one year of its passage, by the governor-general in council, and is also subject to challenge as to its legality in the Supreme Court of Canada, or on appeal by the judicial committee of the Privy Council of the United Kingdom.

Justice.—There is a supreme court of British Columbia presided over by a chief justice and five puisne judges, and there are small-debt courts for amounts up to \$100. In British Columbia the Supreme Court has jurisdiction in divorce cases, this right having been invested in the colony before confederation.

Religion.—In 1891 the population was divided by creeds into—Church of England, 23,619; Methodist, 14,298; Presbyterian, 15,284; Roman Catholic, 20,843; other denominations, 21,031; not stated, 3098; total, 98,173. These figures are now much larger, but there is no reason to suppose that the proportions have materially changed. Except in the cities a large proportion of the religious work of the province is performed by the aid of the missionary societies of England.

Education.—The educational system of British Columbia differs slightly from that of other provinces of Canada. There are three classes of schools—common, graded, and high—all maintained by the Government, and all free and undenominational. There is no university, and only one collegiate establishment—the Methodist college at Vancouver—and that is affiliated with the McGill University in Montreal. The schools are controlled by trustees selected by the ratepayers of each school district, and there is a superintendent of education acting under the provincial secretary. In 1899 there were 280 schools in operation, the expenditure for educational purposes proper being \$268,653, in addition to \$67,362 spent by the public works department on school buildings.

Finance.—Under the terms of union with Canada, British Columbia receives an annual subsidy of \$242,639. This with provincial taxes on real property, personal property, income tax, sales of public land, timber dues, &c., amounted in the year 1899 to \$1,531,638. The expenditure for the year was \$2,156,473. The deficit, however, was due to special expenditure. The gross debt of the province in 1899 was \$3,243,083, with assets \$5,480,248, or a net debt of \$2,762,835. These assets do not include new legislative

buildings or other public works. The income tax is on a sliding scale, and all taxes are subject to a discount of about $\frac{1}{4}$ of 1 per cent. on payment being made before a specified date. In 1899 a fairly close estimate was made of the capital invested in the province, which amounted to \$307,385,000, including timber, \$100,000,000; railways and telegraphs, \$47,500,000; mining plant and smelters, \$10,500,000; municipal assessments, \$45,000,000; provincial assessments, \$51,500,000; in addition to private wealth, \$280,000,000.

Postal.—The number of letters mailed in British Columbia for 1898 was 6,700,000; of post cards, 525,000; registered letters, 165,000; free letters, 156,000; transient newspapers, parcels, periodicals, &c., 836,000.

Mining is the principal industry of British Columbia. The country is rich in gold, silver, copper, and coal, and has some large iron deposits. From 1888 to 1898 the mining output increased from \$2,608,803 to \$10,906,861. By 1900 it had reached \$16,344,751. For 1897-98 the figures are:—

	1897.	1898.
Gold placer . . .	\$513,520	\$643,346
Gold lode . . .	2,122,820	2,201,217
Silver . . .	3,272,836	2,375,841
Copper . . .	266,258	874,781
Lead . . .	1,390,517	1,077,581
Coal . . .	2,648,562	3,407,595
Coke . . .	89,155	175,000
Other materials ¹ . . .	151,600	151,500
Total . . .	\$10,455,268	\$10,906,861

Between 1858—the year of the placer discoveries on the Fraser river and in the Cariboo district—and 1882 the placer yields were much heavier than in subsequent years, running from one to nearly four million dollars annually, but there was no quartz mining. At the present time the greater part of the return is from lode mining, though the use of hydraulic plant has produced a fair proportion and promises to be still more productive, gravel beds of apparent richness having been recently discovered in many districts. The Kootenay districts are at present the chief centres of vein-mining, yielding free-milling gold quartz, auriferous and cupriferous pyrrhotites, as at Rossland, and large quantities of silver-bearing lead ores. Ores of copper and the precious metals are being prospected and worked in the boundary district, and also in several places along the coast and on Vancouver Island. The mining laws are liberal, and being based on the experience gained in the adjacent mining centres of the

¹ Accurate returns of these materials being unobtainable, the figures given are estimated.

Western States, are convenient and effective. There are several smelting and reducing plants in operation at Trail and Nelson in the Kootenay country, and on Texada Island. In the Stocan division of the Kootenay there are five concentrating plants, and another and a cyanide plant at Phillip's Arm on the mainland. Others are being built. Mining machinery of the most modern types is being introduced wherever required.

Coal.—In 1888 the output of coal was 489,301 tons of \$1,467,903 value; in 1898 it had increased to 1,135,865 tons of \$3,407,595 value. Nearly all this was the output of the coal-mines at Nanaimo and Comox on Vancouver Island; 765,811 tons of the 1898 output were exported, 752,686 tons going to the United States.

Fisheries.—A large percentage of the commerce is derived from the sea, the chief product being salmon. Halibut, cod (several varieties), oolachan, sturgeon, herring, and many other fishes are also plentiful, but with the exception of the halibut these have not yet become the objects of extensive industries. There are several kinds of salmon, and they run in British Columbia waters at different seasons of the year. The quinnat or spring salmon is the largest and best table fish, and is followed in the latter part of the summer by the sockeye, which runs in enormous numbers up the Fraser river. This is the fish preferred for canning. It is of brighter colour, more uniform in size, and comes in such quantities that a constant supply can be reckoned upon by the canneries. About the mouth of the Fraser river from 1500 to 2000 boats are occupied during the run. The silver salmon or coho arrives a little later than the sockeye, but is not much used for packing except when required to make up deficiencies. The dog-salmon and the humpbacked have no commercial value, and are only used by Indians. Great Britain is the chief but not the only market for British Columbia salmon. The years vary in productiveness, 1897 having been unusually large and 1898 the smallest in five years, but the average pack is about 500,000 cases of 48 one-lb tins. The value of the salmon export for 1899 was \$2,740,124, the greater part of all returns being from the Fraser river canneries, the rivers of the Inlets and Skeena river coming next in order. There are between fifty and sixty canneries, of which about fifty are on the banks of the Fraser river. The total value of the fisheries product from 1876 to 1896 inclusive was \$45,912,686, of which salmon is represented at \$28,873,083, all other kinds, including fur-seals and fish oils, making up the balance. The fish oils are extracted chiefly from several species of dog-fish, and sometimes from the basking shark, as well as from the oolachan, which is also an edible fish.

The fur-seal fishery is an important industry, though apparently a declining one, the average value of late years having been about \$700,000. Owing to the low price of seal-skins and international difficulties concerning pelagic sealing in Bering Sea, where the greatest number have been taken, the business of seal-hunting is losing favour. The amount of capital invested in vessels, plant, &c., in 1897 for fishing and sealing was \$2,514,660.

The Dominion Government has established a fish-hatchery, and another is to be added, and oysters and lobsters from the Atlantic coast have been planted in British Columbia waters.

Timber.—The province is rich in forest growth, and there is now a steady demand for its lumber in South America, Africa, Australia, and China. The following is a list of some of the more important trees of a commercial kind—large-leaved maple (*Acer macrophyllum*), red alder (*Alnus rubra*), western larch (*Larix occidentalis*), white spruce (*Picea alba*), Engelmann's spruce (*Picea Engelmannii*), Menzies' spruce (*Picea sitchensis*), white mountain pine (*Pinus monticola*), black pine (*Pinus murrayana*), yellow pine (*Pinus ponderosa*), Douglas fir (*Pseudotsuga Douglasii*), western white oak (*Quercus garryana*), giant cedar (*Thuja gigantea*), yellow cypress or cedar (*Thuja excelsa*), western hemlock (*Tsuga mertensiana*). The principal timber of commerce is the Douglas fir, which grows to a very great size in the neighbourhood of the coast, and has great weight-bearing power. Red or giant cedar is plentiful, and is used for shingles. The western white spruce is also much employed for various purposes. There are about eighty sawmills—large and small—in the province. In 1898 the export of timber amounted to 52,531,458 feet; Australia taking 25,928,877 feet, South America 7,342,818, South Africa 5,316,587, China 7,116,350, Japan 1,152,894, Great Britain or Europe 4,401,767, and Vladivostok 1,272,165. The whole cut for the year, excluding railway and Dominion lands, was 124,546,658 feet.

Agriculture.—British Columbia is not in the main a farming country, but there are many localities admirably suited for the cultivation of cereals, hay, and fruit. The lower Fraser is the principal part where farming is carried on without irrigation, but in all parts of the southern interior below a certain level farming can be carried on where water for irrigating is convenient. In the northern interior and Spallumcheen valley, irrigation is not necessary. Cattle, horse, and sheep "ranches" are numerous and important in the southern interior, where the climate and conditions are especially favourable. A great deal of the farm produce and fruit at present used is imported, but in 1899 the

exports show \$61,239 of agricultural produce and \$355,323 of animals, the greater part of the latter being beef cattle.

Imports and Exports.—The value of the imports of 1899 was \$8,714,733, of which \$7,101,735 was dutiable and \$1,612,998 free. The duties collected for the year amounted to \$2,350,738. Exports, being the produce of Canada, from the province amounted in 1899 to \$14,748,025, the largest amount yet reached with the exception of 1898, when \$16,919,717 was exported. The exports of 1899 comprised products of the mine, \$10,467,502; of the fisheries, \$2,740,124; of the forest, \$527,820; animals and their produce, \$355,323; agricultural products, \$61,239; miscellaneous, \$420,689. The exports of 1899 show an increase of \$10,413,719 over those of 1889.

Railways.—The Pacific division of the Canadian Pacific railway enters British Columbia through the Rocky Mountains on the east, and runs for about 500 miles before reaching the terminus at Vancouver. From that port steamers convey the mails and passengers for Vancouver Island to Victoria. The same company have built a southern branch line from Lethbridge in Alberta through the Crow's Nest Pass, near the international boundary line, into the Kootenay country, opening up extensive coal-fields from which the mines in southern British Columbia will in the future be supplied with coal and coke for smelting, a development of the country's resources which must add greatly to the value of its mines, from which most of the ore has heretofore been exported in a crude state. This road has several branches to mining towns on the south of its main line, and there are several other short lines not connected with the Canadian Pacific system. On Vancouver Island there are two railways, the Esquimalt and Nanaimo railway (78 miles), connecting the coal-fields with the southern ports, and the Victoria and Sydney of about 16 miles in length. Apart from the Canadian Pacific railway, the bonded debt of the lines in British Columbia is about five and a half million dollars, and the total cost of them, including rolling stock, about \$49,000,000.

Shipping.—The Canadian Pacific railway company has two lines of mail steamers running from Vancouver and Victoria—(1) the Empress line, which runs to Japan and China once in three weeks, and (2) the Australian line to Honolulu, Fiji, and Sydney once a month. 1272 sea-going ships with 1,239,470 tons of cargo cleared from the four ports—Victoria, Vancouver, Nanaimo, and New Westminster; and 1108 vessels, carrying 931,416 tons of cargo, entered at the same ports during the year 1899. In ballast 754 of 493,557 tonnage cleared outwards, and 890 of 818,919 entered. In the coasting trade 5758 vessels of 1,408,973 tonnage cleared outwards, and 5702 with 1,875,914 entered. During the year 51 vessels, aggregating 4954 tons, were built in the province, and 49, aggregating 4641 tons, were registered.

Fauna.—Among the larger mammals are the big-horn or mountain sheep (*Ovis canadensis*), the Rocky Mountain goat (*Maxama montana*), the grizzly bear, moose, woodland caribou, black-tailed or male deer, white-tailed deer, and coyote. All these are to be found only on the mainland. The black bear, wolf, puma, lynx, wapiti, and Columbian or coast deer are common to parts of both mainland and islands. Of marine mammals the most characteristic are the sea-lion, fur-seal, sea-otter, and harbour-seal. About 340 species of birds are known to occur in the province, among which, as of special interest, may be mentioned the burrowing owl of the dry, interior region, the American magpie, Steller's jay, and a true nut-cracker, Clark's crow (*Picicorvus columbianus*). True jays and orioles are also well represented. The gallinaceous birds include the large blue grouse of the coast, replaced in the Rocky Mountains by the dusky grouse. The western form of the "spruce partridge" of Eastern Canada is also abundant, together with several forms referred to the genus *Bonasa*, generally known as "partridges" or ruffed grouse. Ptarmigans also abound in many of the higher mountain regions. Of the *Anatidae* only passing mention need be made. During the spring and autumn migrations many species are found in great abundance, but in the summer a smaller number remain to breed, chief among which are the teal, mallard, wood-duck, spoon-bill, pin-tail, buff-head, red-head, canvas-back, scaup-duck, &c.

BRITISH EMPIRE, THE.

THE land surface of the earth is estimated to extend over about 52,500,000 square miles. Of this area the British empire occupies nearly one-quarter, extending over an area of about 12,000,000 square miles. By far

Extent. the greater portion lies within the temperate zones, and is suitable for white settlement. The notable exceptions are the southern half of India and Burma; East, West, and Central Africa; the West Indian Colonies; the northern portion of Australia; New Guinea, British Borneo, and that portion of North America which extends into Arctic regions. The area of the territory of the empire is divided almost equally between the southern and the northern hemispheres, the great divisions of Australasia and South Africa covering between them in the southern hemisphere 5,308,506 square miles, while the United Kingdom, Canada, and India, including the native states, cover between them in the northern hemisphere 5,271,375 square miles. The alternation of the seasons is thus complete, one-half of the empire enjoying summer, while one-half is in winter. The division of territory between the eastern and western hemispheres is less equal, Canada occupying alone in the western hemisphere 3,653,946 square miles, while Australasia, South Africa, India, and the United Kingdom occupy together in the eastern hemisphere 6,925,975 square miles. As a matter of fact, however, the eastern portions of Australasia border so nearly upon the western hemisphere that the distribution of day and night throughout the empire is, like the alternations of the seasons, almost complete, one-half enjoying daylight, while the other half is in darkness. These alternations of time and of seasons, combined with the variety of soils and climates, are calculated to have an increasingly important effect upon the material and industrial, as well as upon the social and political developments of the empire. This will become evident in considering the industrial productions of the different divisions, and the harvest seasons which permit the summer produce of one portion of the empire to supply the winter requirements of its other markets, and conversely.

The empire contains or is bounded by some of the highest mountains, the greatest lakes, and the most important rivers of the world. Its climates may be said to include all the known climates of the world; its soils are no less various. In the prairies of Central Canada it possesses some of the most valuable wheat-producing land; in the grass lands of the interior of Australia the best pasture country; and in the uplands of South Africa the most valuable gold- and diamond-bearing beds which exist. The United Kingdom at present produces more coal than any other single country except the United States (which exceeded the British output in 1900). The effect of climate throughout the empire in modifying the type of the Anglo-Saxon race has as yet received only partial attention, and conclusions regarding it are of a somewhat empiric nature. The general tendency in Canada is held to be towards somewhat smaller size, and a hardy active habit; in Australia to a tall, slight, pale development locally known as "cornstalkers," characterized by considerable nervous and intellectual activity. In New Zealand the type preserves almost exactly the characteristics of the British isles. The South African, both Dutch and British, is readily recognized by an apparently sun-dried, lank, and hard habit of body. In the tropical possessions of the empire where white settlement does not take place to any considerable extent the individual alone is affected. The type undergoes no modification. It is to be observed in

reference to this interesting aspect of imperial development, that the multiplication and cheapening of channels of communication and means of travel throughout the empire will tend to modify the future accentuation of race difference, while the variety of elements in the vast area occupied should have an important, though as yet not scientifically traced, effect upon the British imperial type.

The white population of the empire reaches a total of upwards of 52,000,000, or about one-eighth of its entire population, which, including native races, is *Population.* estimated at something over 430,000,000. The white population includes some French, Dutch, and Spanish peoples, but is mainly of Anglo-Saxon race. It is distributed roughly as follows:—

United Kingdom and Ireland	41,454,578
Australia	4,600,000
Canada—French	1,400,000
English	3,800,000
	5,200,000
Africa—Dutch }	1,000,000
British }	
India	100,000
West Indies and Bermuda	100,000
	52,454,578

These figures must be taken only as approximate. In some cases census details are out of date, and official estimates have been accepted.

The native population of the empire includes types of the principal black, yellow, and brown races, classing with these the high-type races of the East, which may almost be called white. It is distributed as follows:—

<i>India.</i>		
British Provinces	Mainly high type, brown	231,085,132
Native States		63,181,569
British Tracts		607,710
		294,874,411

The population of India is divided into 118 groups, on the basis of language. These may, however, be collected into twelve principal groups as follows:—

Aryo-Indic	Khasi	Sinitic
Dravidian	Tibeto-Burman	Aryo-Iranic
Kolarian	Mon Annam	Semitic
Gypsy	Shan	Aryo-European

Eastern Colonies.

Ceylon { High type, brown and mixed }	3,391,000
Straits Settlements—Brown and mixed	267,073
Chinese yellow	228,000
Hong-Kong—Chinese yellow	211,000
Brown	1,901
North Borneo—Mixed brown	200,000
	4,298,974

Of the various races which inhabit these Eastern dependencies the most important are the 2,000,000 Sinhalese and the 750,000 Tamil that make up the population of Ceylon. The rest is made up of Malays, Chinese (in the Straits Settlements and Hong-Kong), Dyaks, Eurasians, and others.

West Indies.

The West Indies, including the continental colonies of British Guiana and Honduras, and seventeen islands or groups of islands, have a total coloured population of about 1,600,000. The colonies of this group which have the largest coloured populations are:—

Jamaica—Chiefly black, some brown and yellow	625,000
Trinidad—Black and brown	244,000
British Guiana—Black and brown	270,000
	1,139,000

The populations of the West Indies are very various, being made up largely of imported African negroes. In Jamaica these contribute four-fifths of the population. There are also in the islands a considerable number of imported East Indian coolies and some Chinese. The aboriginal races include American Indians of the mainland and Caribs. With these there has been intermixture of Spanish and Portuguese blood, and many mixed types have appeared. The total European population of this group of colonies amounts to upwards of 80,000, to which 15,000 on account of Bermuda may be added.

Africa.

South } Chiefly black {	:	:	:	5,000,000
Central }	:	:	:	3,000,000

The aboriginal races of South Africa were the Hottentots and Bushmen. The Hottentots are a yellow-skinned race with crisp light hair. The Bushmen, who appear to have been a lower order of the same race, are believed to be the aboriginal type of the Abatwa or pigmy race of Central Africa. Both these races are rapidly diminishing in numbers, and in British South Africa it is expected that they will in the course of the twentieth century become extinct. Besides these primitive races there are the dark-skinned negroids of Bantu stock, commonly known in their tribal groups as Kaffirs, Zulus, Makalakas, Bechuanas, and Damaras, which are again subdivided into many lesser groups. The Bantu compose the greater part of the native population. There are also in South Africa Malays and Indians and others, who during the last two hundred years have been introduced from Java, Ceylon, Madagascar, Mozambique, and British India, and by intermarriage with each other and with the natives have produced a hybrid population generally classed together under the heading of the Mixed Races. These are of all colours, varying from yellow to dark brown. The tribes of Central Africa are as yet less known. Many of them exhibit racial characteristics allied to those of the tribes of South Africa, but with in some cases an admixture of Arab blood.

East Africa.

Protectorate—Black and brown {	Natives	.	2,485,000
	Asiatics	.	15,000
Zanzibar—Black and brown .	.	.	250,000
Uganda—Estimated in 1899 .	.	.	3,800,000
			6,550,000

West Africa.

Nigeria {	Black and brown	} Estimated in 1900	.	35,000,000
Lagos			.	3,000,000
Gold Coast	Chiefly black	{	.	1,500,000
Sierra Leone			.	260,000
Gambia			.	14,000
				4,774,000

From east to west across Africa the aboriginal nations are mostly of the black negroid type, their varieties being only imperfectly known. The tendency of some of the lower negroid types has been to drift towards the west coast, where they still practise cannibalistic and fetish rites. On the east coast are found much higher types approaching to the Christian races of Abyssinia, and from east to west there has been a wide admixture of Arab blood producing a light brown type. In Uganda and Nigeria a large proportion of the population is Arab and relatively light-skinned.

Australasia.

Australia—Black, very low type .	.	.	200,000
Chinese and half castes, yellow .	.	.	50,000
New Zealand—Maoris, brown .	.	.	40,000
Fiji—Polynesian, black and brown .	.	.	121,700
New Guinea—Polynesian, black and brown .	.	.	250,000
			661,700

The native races of Australia and the Polynesian groups of islands are divided into two main types known as the dark and light Polynesian. The dark type, which is black, is of a very low order, and in some of the islands still retains its cannibal habits. The aboriginal tribes of Australia are of a low-class black tribe, but generally peaceful and inoffensive in their habits. The white Polynesian races are of a very superior type, and exhibit, as in the Maoris of New Zealand, characteristics of a high order. The natives of New Guinea are in a very low state of civilization. The estimate given of their numbers is approximate, as no census has been taken.

Canada.

Indians—Brown	100,000
-------------------------	---------

The only coloured native races of Canada are the Red Indians, many in tribal variety, but few in numbers.

Summary.

NATIVE POPULATIONS OF PRINCIPAL DIVISIONS OF THE EMPIRE.

India	294,874,411
Ceylon and Eastern Colonies	4,298,974
West Indies	1,650,000
South Africa	5,000,000
British Central Africa	3,000,000
East Africa	6,550,000
West Africa	40,000,000
Australasia and Islands	661,000
Canada	100,000
	356,134,385
White populations	52,454,578
Giving a total of	408,588,963

This is without taking into account the population of the lesser Crown colonies or allowing for the increase likely to be shown by a later census. Throughout the empire, and notably in the United Kingdom, there is among the white races a considerable sprinkling of Jewish blood.

The latest calculation of the entire population of the world, including a liberal estimate of 650,000,000 for peoples not brought under any census, gives a total of something over 1,500,000,000. The population of the empire may therefore be calculated as amounting to something more than one-fourth of the population of the world.

It is a matter of first importance in the geographical distribution of the empire that the five principal divisions, the United Kingdom, South Africa, India, Australia, and Canada are separated from each other by the three great oceans of the world. The distance as usually calculated in nautical miles: from an English port to the Cape of Good Hope is 5840 miles; from the Cape of Good Hope to Bombay is 4610; from Bombay to Melbourne is 5630; from Melbourne to Auckland is 1830; from Auckland to Vancouver 6210; from Halifax to Liverpool is 2744. From a British port direct to Bombay by way of the Mediterranean it is 6272; from a British port by the same route to Sydney 11,548 miles. These great distances have necessitated the acquisition of intermediate ports suitable for coaling stations on the trade routes, and have determined the position of many of the lesser Crown colonies which are held simply for military and commercial purposes. Such are the Bermudas, Gibraltar, Malta, Aden, Ceylon, the Straits Settlements, Labuan, Hong-Kong, which complete the chain of connexion on the eastern route, and such on other routes are the lesser West African stations,—Ascension, St Helena, the Mauritius, and Seychelles, the Falklands, Tristan d'Acunha, and the groups of the Western Pacific. Some of the latest annexations of the British empire have been rocky islets of the Northern Pacific required for the purpose of telegraph stations in connexion with an all-British cable.

For purposes of political administration the empire falls into the three sections of the United Kingdom of Great Britain and Ireland, with the dependencies of the Channel Islands and the Isle of Man; the Indian empire, consisting of British India and the feudatory native states; and the Colonial empire comprising all other colonies and dependencies.

In the modern sense of extension beyond the limits of the United Kingdom the growth of the empire is of comparatively recent date. The Channel Islands became British as a part of the Norman inheritance of William the Conqueror. The Isle of Man, which was for a short time held in conquest by Edward I. and restored, was sold by its titular sovereign to Sir William Scroop, earl of Wiltshire, in the year 1393, and by his subsequent attainder for high treason and the confiscation of his estates, became a fief of the English Crown. It was granted by Henry IV. to the earls of Stanley, and held by them and their collateral descendants until the sovereignty and revenues of the island were finally surrendered to the Crown in 1765. With these exceptions and the nominal possession taken of Newfoundland by Sir Humphrey Gilbert in 1583, all the territorial acquisitions of the empire have been made in the 17th, 18th, and 19th centuries.

The following list of British colonies and dependencies shows the date and manner of their acquisition:—

Name.	Date.	Method of Acquisition.
Newfoundland	1583	Possession taken by Sir H. Gilbert for the Crown.

17th Century.

St Helena	1600	Captured. Settled by East India Coy. 1651. Government vested in British Crown, 1833.
Barbados	1605	Settlement.
Bermudas	1609	"
Prince Edward Is.	1626	"
Nova Scotia	1626	"
New Brunswick	1626	"
St Christopher	1623	"
Nevis	1628	"
Bahamas	1629	"
Gambia	1631	"
Antigua	1632	"
Leeward Is.	1632	"
Jamaica	1655	Conquered.
Gold Coast	1661	Settlement.
N. - W. Territories of Canada	1670	Settlement under Royal Charter of Hudson Bay Coy. Purchased from Imp. Govt. 1869, and transferred to Canada 1870.

18th Century.

Name.	Date.	Method of Acquisition.
Gibraltar	1704	Capitulation.
Ontario	1759-90	"
Quebec	1759-90	"
Dominica	1763	"
St Vincent	1763	"
Grenada	1763	"
Windward Is.	1763	"
Tobago	1763	"
Falkland Is.	1765	Settlement.
Honduras	1783-86	Treaty.
Sierra Leone	1787	Settlement.
N. S. Wales	1788	"
Ceylon	1795	Capitulation.
Trinidad	1797	"

19th Century.

Malta	1800	Capitulation.
B. Guiana	1803	"
St Lucia	1803	"
Tasmania	1803	Settlement.
Cape of Good Hope	1806	Capitulation.
Seychelles	1806	"

19th Century—continued.

Name.	Date.	Method of Acquisition.
Mauritius	1810	Capitulation.
Ascension and Tristan d'Acunha	1815	Military occupation.
West Australia	1829	Settlement.
South Australia	1836	"
New Zealand	1840	Settlement and treaty.
Hong-Kong	1843-61	Treaties. Kowloon on the mainland added in 1861.
Natal	1844	By separation from Cape.
Labuan	1846	Cession.
Turks and Caicos Is.	1848	Separation from Bahamas.
Victoria	1851	Separation from N. S. Wales.
B. Columbia	1858	Settlement under Hudson Bay Coy. Transferred to Crown 1869. Entered Canadian Confederation 1871.
Straits Settlements	1858	Vested in Crown by E. I. Coy. Transferred from Indian to Colonial possessions, 1867.
Queensland	1859	By separation from N. S. Wales.
Lagos	1861	Cession.
Manitoba	1870	By separation from N. - W. Territory.
Fiji	1874	Cession.
W. Pacific Islands, including Union, Ellice, Gilbert, Southern Solomon, and other groups	1877	By international agreement. High commission created by Order in Council, giving jurisdiction over islands not included in other Colonial Governments, nor within jurisdiction of other civilized powers. Tonga and Cook Islands annexed to New Zealand 1900.
Cyprus	1878	Occupied by treaty.
North Borneo	1881	Treaty and settlement under Royal Charter.
Niger Coast or S. Nigeria	1884	Protectorate declared.
B. New Guinea	1884	"
Bechuanaland	1885	"
Nigeria	1886	Treaty, conquest, and settlement under Royal Charter. Transferred to Crown, incorporated with Niger Coast Protectorate and divided into N. and S. Nigeria, 1900.
Somaliland	1887	Protectorate declared.
Sarawak	1888	"
Brunei	1888	"
British East Africa	1888	Treaty, conquest, and settlement under Royal Charter. Transferred to Crown 1895.
Rhodesia	1889	Treaty, conquest, and settlement under Royal Charter.
British Central Africa	1891	Protectorate declared.
Federated Malay States	1874-95	Treaty.
Uganda	1894-96	Protectorate declared.
Pacific Islands—Christmas, Fanning, Penrhyn, Suvarrow	1898	Annexed for purposes of projected Pacific cable.
Wei-hai-Wei	1898	Lease from China.
Orange River Colony	1900	Annexation.
Transvaal	1900	Annexation.

In the Pacific there are, in addition to the possessions already mentioned, Bauman Islands, Bakir Island, Bell Cay, Bird Island, Bramble Cay, Caroline Island, Cato Island, Coral Island and Dudosa, Danger Island, Ducie Island, Flint Island, Howland Island, Humphrey Island, Jarvis Island, Lihow Island, Little Scrub Island, Malden Island, Manihiki Islands, Nassau Island, Palmerston Island, Palmyra Island, Phoenix Group of Islands, Pitcairn Island, Purdy Group, Raine Island, Rierson Island, Roggewein Island, Sophia Island, Starbuck Island, Surprise Island, Teinhoven Island, Vestoc, Washington or New York Island, Willis Group, Wreck Reef, Macquarie Island, Rotuma Island, and islands adjacent to British New Guinea. Among the dependencies of New Zealand should be mentioned the Kermadec Islands.

In the Indian Ocean there are, besides the colonies already mentioned, Seychelles, Rodrigues, the Chagos

Islands, St Brandon Islands, Amirante Islands, Aldabra and some other small groups. There are also the Kuria-Muria Islands, the Maldiv Islands, and the Ashmore Islands.

In America there is all land which lies to the north of the Canadian provinces, with the exception of the United States territory of Alaska and its dependencies.

The Indian section of the empire was acquired during the same three centuries under a royal charter granted to the East India Company by Queen Elizabeth in 1600. It was transferred to the Imperial Government in 1858, and Queen Victoria was proclaimed empress under the Royal Titles Act in 1877. The following list gives the dates and method of acquisition of the centres of the main divisions of the Indian empire. They have, in most instances, grown by general process of extension to their present dimensions.

The nine provinces are :—

Name.	Date.	Method of Acquisition.
Madras .	1639 to 1748	By treaty and subsequent conquest. Fort St George, the foundation of Madras, was the first territorial possession of the E. I. Coy. in India. It was acquired by treaty with its Indian ruler. Madras was raised into a presidency in 1683; ceded to France 1746; recovered 1748.
Bombay .	1608 to 1685	Treaty and cession. Trade first established 1608. Ceded to British Crown by Portugal 1661. Transferred to E. I. Coy. 1668. Presidency removed from Surat 1685.
Bengal .	1633 to 1765	Treaty and subsequent conquests. First trade settlement established by treaty at Pipili in Orissa 1633. Erected into presidency by separation from Madras 1681. Virtual sovereignty announced by E. I. Coy., as result of conquests of Clive, 1765.
N.-W. Provinces and Oudh	1764 to 1856	By conquests and treaty through successive stages, of which the principal dates were 1801-3-14-15. In 1832 the nominal sovereignty of Delhi, till then retained by the Great Mogul, was resigned into the hands of the E. I. Coy. Oudh, of which the conquest may be said to have begun with the battle of Baxar in 1768, was finally annexed in 1856. It was attached as a commissionership to the N.-W. Provinces in 1879.
Central Provinces	1802-17	By conquest and treaty.
Assam .	1825-26	Conquest and cession.
Burma .	1824-52	Conquest and cession.
Punjaub .	1849	Conquest and annexation. Made into distinct province 1859.
N.-W. Frontier Province	1901	Subdivision.

The senior commissionerships are :—

Ajmere and Merwara	1818	By conquest and cession.
Coorg	1834	Conquest and annexation.
British Baluchistan	1841-76	Conquest and treaty.
Andaman Islands	1858	Annexation.

The following is a list of the principal Indian states or agencies which are more or less under the control of the British Government :—

Haidarabad.	Kashmir.
Baroda.	Sikkim.
Mysore.	Shan States.
Rajputana States, including	
Udaipur.	Dholpur.
Jodhpur.	Alwar.
Bikaner.	Jhalawar.
Jaipur (and feudatories).	Tonk.
Bhurtpur.	Kotah.
Central Indian States, including	
Indore.	Bhopal.
Rewa.	Gwalior.

Bombay States, including	
Cutch.	Khairpur (Sind).
Kolhapur (and dependencies).	
Madras States, including	
Travancore.	Cochin.
Central Provinces States	
Bastar.	
Bengal States	
Cooch Behar.	Hill Tipperah.
N.-W. Provinces States, including	
Rampur.	Garhwal.
Punjaub States, including	
Patiala.	Sirmur (Nahan).
Bahawalpur.	Maler Kotla.
Jind.	Faridkot.
Nabha.	Chamba.
Kapurthala.	Suket.
Mandi.	Kalsia.

In addition to these there are British tracts known as the Upper Burma frontier and the Burma frontier. There is also a sphere of British influence in the border of Afghanistan. The state of Nepal, though independent, has been since the campaign of 1814-15 in close relations with Great Britain. All these native states have come into relative dependency upon Great Britain as a result of conquest or of treaty consequent upon the annexation of the neighbouring provinces. The settlement of Aden, with its dependencies of Perim and Socotra Island, forms part of the government of Bombay.

This vast congeries of states, widely different in character, and acquired by many different methods, holds together under the supreme headship of the Crown on a generally acknowledged triple principle of self-government, self-support, and self-defence. The principle is more fully applied in some parts of the empire than in others; there are some parts which have not yet reached their full political evolution; some others in which the principle is temporarily or for special reasons in abeyance; others, again—chiefly those of very small extent, which are held for purposes of the defence or advantage of the whole—to which it is not applicable; but the principle is generally acknowledged as the structural basis upon which the constitution of the empire exists.

In its relation to the empire the home section of the British Isles is distinguished from the others as the place of origin of the British race and the residence of the Crown. The history and constitutional development of this portion of the empire will be found fully treated under separate headings. (See ENGLAND AND WALES; ENGLISH HISTORY; IRELAND, SCOTLAND, UNITED KINGDOM, &c.)

The total revenue, expenditure, and trade of the home section of the empire in 1900 were as follows :—

Revenue	£119,839,905
Expenditure	133,976,920
Imports	563,146,659
Exports	387,522,633

For full information with regard to the constitution and history of India and the Colonies reference must also be made to the respective headings. (See INDIA, AFRICA, AUSTRALIA, CANADA, &c.)

It is enough to say that for purposes of administration the Indian empire is divided into nine great provinces (of which the ninth, the N.-W. Frontier, was proclaimed in 1901) and four minor commissionerships. The nine great provinces are presided over by two governors (Bombay and Madras), four lieutenant-governors (Bengal, North-West Provinces, the Punjaub, and Burma), and three chief commissioners (Assam, the Central Provinces, and the N.-W. Frontier Province). The four minor commissionerships are presided over each by a chief commissioner. Above

these the supreme executive authority in India is vested in the Viceroy in Council. The Council consists of five ordinary members besides the existing Commander-in-Chief. For legislative purposes the Governor-General's Council is increased by the addition of sixteen members nominated by the Crown, and has power under certain restrictions to make laws for British India, for British subjects in the Native States, and for native Indian subjects of the Crown in any part of the world. The administration of the Indian empire in England is carried on by a Secretary of State for India assisted by a council of not less than ten members. The expenditure of the revenues is under the control of the Secretary in Council.

The total revenue, expenditure, and trade of India for 1900 were as follows:—

Revenue	£67,617,800
Expenditure	64,976,920
Imports	64,185,440
Exports	78,646,690

The Colonial empire—exclusive of the Transvaal and Orange River Colonies—comprises forty-three district governments. It is divided into colonies of three classes and dependencies; these, again, are in some instances associated for administrative purposes in federated groups. The three classes of colonies are Crown Colonies, Colonies possessing representative institutions but not responsible government, and Colonies possessing representative institutions and responsible government. In Crown Colonies the Crown has entire control of legislation, and the public officers are under the control of the Home Government. In representative Colonies the Crown has only a veto on legislation, but the Home Government retains control of the public officers. In responsible Colonies the Crown retains a veto upon legislation, but the Home Government has no control of any public officer except the Governor.

In Crown Colonies—with the exception of Gibraltar and St Helena, where laws may be made by the Governor alone—laws are made by the Governor with the concurrence of a council nominated by the Crown. In some Crown Colonies, chiefly those acquired by conquest or cession, the authority of this council rests wholly on the Crown; in others, chiefly those acquired by settlement, the council is created by the Crown under the authority of local or Imperial laws. The Crown council of Ceylon may be cited as an example of the first kind, and the Crown council of Jamaica of the second.

In colonies possessing representative institutions without responsible government, the Crown cannot (generally) legislate by Order in Council, and laws are made by the Governor with the concurrence of the legislative body or bodies, one at least of these bodies in cases where a second chamber exists possessing a preponderance of elected representatives. The Bahamas, Barbados, and Bermuda have two legislative bodies—one elected and one nominated by the Crown; Malta and the Leeward Islands have but one, which is partly elected and partly nominated.

Under responsible government legislation is carried on by parliamentary means exactly as at home, with a cabinet responsible to parliament, the Crown reserving only a right of veto which is exercised at the discretion of the Governor in the case of certain Bills. The executive councils in those colonies designated as at home by parliamentary choice are appointed by the Governor alone, and the other public officers only nominally by the Governor on the advice of his executive council.

Colonial governors are classed as governors-general; governors; lieutenant-governors; administrators; high commissioners; and commissioners, according to the status

of the colony and dependency, or group of colonies and dependencies over which they preside. Their powers vary according to the position which they occupy. In all cases they represent the authority of the Crown.

As a consequence of this organization the finance of Crown Colonies is under the direct control of the Imperial Government; the finance of representative Colonies, though not directly controlled, is usually influenced in important departures by the opinion of the Imperial Government. In responsible Colonies the finance is entirely under local control, and the Imperial Government is dissociated from either moral or material responsibility for colonial debts.

The total revenue, expenditure, and trade of the Colonial empire for 1900 were as follows:—

Revenue	£58,815,700
Expenditure	56,563,660
Imports	181,846,110
Exports	192,330,040

In federated groups of colonies and dependencies matters which are of common interest to a given number of separate governments are by mutual consent of the federating communities adjudged to the authority of a common government, which, in the case of self-governing colonies, is voluntarily created for the purpose. The associated states form under the federal government one federal body, but the parts retain control of local matters, and exercise all their original rights of government in regard to these. The advantages of united action are thus secured for larger questions without impairing the vigour of independent initiative in matters of individual concern. The two great self-governing groups of federated colonies within the empire are the Dominion of Canada and the Commonwealth of Australia. India, of which the associated provinces are under the control of the central Government, may be given as an example of the practical federation of dependencies. Examples of federated Crown Colonies and lesser dependencies are to be found in the Leeward Island group of the West Indies and the federated Malay States.

This rough system of self-government for the empire has been evolved not without some strain and friction, by the recognition through the vicissitudes of three hundred years of the value of independent initiative in the development of young countries. Queen Elizabeth's first patent to Sir Walter Raleigh permitted British subjects to accompany him to America, "with guarantee of a continuance of the enjoyment of all the rights which her subjects enjoyed at home."

This guarantee may presumably have been intended at the time only to assure the intending settlers that they should lose no rights of British citizenship at home by taking up their residence in America. Its mutual interpretation in a wider sense, serving at once to establish in the colony rights of citizenship equivalent to those enjoyed in England, and to preserve for the colonist the status of British subject at home and abroad, has formed in application to all succeeding systems of British colonization the unconscious charter of union of the empire.

The first American colonies were all settled under royal grants. Each had its own constitution, and looked to no other head but the king. Their governments were free—the executive being responsible to the elective element in the legislature, as now in the colonies which enjoy responsible self-government. The immense distance which in those days separated America from Great Britain secured them from interference on the part of the home authorities. They paid their own most moderate governing expenses, and they contributed largely to their own defence. From the middle of the 17th century their trade was not free, but this was the only restriction from which

they suffered. The great war with France in the middle of the 18th century temporarily destroyed this system. That war, which resulted in the conquest of Canada and the delivery of the North American colonies from French antagonism, cost the Imperial exchequer £90,000,000. The attempt to avert the repetition of such expenditure by the assertion of a right to tax the colonies through the British Parliament led to the one great rupture which has marked the history of the empire. It has to be noted that at home during the latter half of the 17th century and the earlier part of the 18th century Parliamentary power had to a great extent taken the place of the Divine Right of kings. But Parliamentary power meant the power of the English people and taxpayers. The struggle which developed itself between the American colonies and the British Parliament, was in fact a struggle on the part of the people and taxpayers of one portion of the empire to resist the domination of the people and taxpayers of another portion. In this light it may be accepted as having historically established the fundamental axiom of the constitution of the empire, that the Crown is the supreme head from which the parts take equal dependence.

The Crown requiring advice in the ordinary and constitutional manner receives it in matters of colonial administration from the Secretaries of State for the Colonies and for India. After the great rupture separate provision in the Home Government for the administration of colonial affairs was at first judged to be unnecessary, and the "Council of Trade and Plantations," which up to that date had supplied the place now taken by the two offices of the Colonies and India, was suppressed in 1782. There was a reaction from the liberal system of colonial self-government, and an attempt was made to govern the colonies which remained, simply as dependencies, the Home Treasury being responsible for their expenditure as now in the Crown Colonies.

In 1791, not long after the extension of the range of Parliamentary authority in another portion of the empire, by the creation in 1784 of the Board of Control for India, Pitt made the step forward of granting to Canada representative institutions, of which the Home Government kept the responsible control. Similar institutions were also given at a later period to Australia and South Africa. But the long peace of the early part of the 19th century was marked by great colonial developments; Australia, Canada, and South Africa became important communities. Representative institutions controlled by the Home Government were insufficient for their needs, and they reasserted the old British colonial claim for liberty to manage their own affairs.

Fully responsible government was granted to Canada in 1840, and gradually extended to the other colonies. In 1854 a separate Secretary of State for the Colonies was appointed at home, and the Colonial Office was established on its present footing. In India, as in the Colonies, there came with the growing needs of empire a recognition of the true relations of the parts to each other and of the whole to the Crown. In 1858, on the complete transference of the territories of the East India Company to the Crown, the Board of Control was abolished, and the India Council, under the presidency of a Secretary of State for India, was created. It was especially provided that the members of the council may not sit in Parliament.

Thus, although it has not been found practicable in the working of the British constitution to carry out the full theory of the direct and exclusive dependence of colonial possessions on the Crown, the theory is recognized as far as possible. It is understood that the principal sections of the empire enjoy equal rights under the Crown,

and that none are subordinate to each other. The intervention of the Imperial Parliament in colonial affairs is only admitted theoretically in so far as the support of Parliament is required by the constitutional advisers of the Crown. To bring the practice of the empire into complete harmony with the theory it would be necessary to constitute, for the purpose of advising the Crown upon Imperial affairs, a parliament or council in which all important parts of the empire should be represented.

The gradual recognition of the constitutional theory of the British empire, and the assumption by the principal colonies of full self-governing responsibilities, has cleared the way for a movement in favour of a further development which should bring the supreme headship of the empire more into accord with modern ideas.

It was during the period of domination of the "Manchester school," of which the most effective influence in public affairs was exerted for about thirty years, extending from 1845 to 1875, that the fullest development of colonial self-government was attained, the view being generally accepted at that time that self-governing institutions were to be regarded as the preliminary to inevitable separation. A general inclination to withdraw from the acceptance of Imperial responsibilities throughout the world gave to foreign nations at the same time an opportunity by which they were not slow to profit, and contributed to the force of a reaction of which the part played by Great Britain in the scramble for Africa marked the culmination. Under the increasing pressure of foreign enterprise, the value of a federation of the empire for purposes of common interest began to be discussed. Imperial federation was openly spoken of in New Zealand as early as 1852. A similar suggestion was officially put forward by the general association of the Australian Colonies in London in 1857. The Royal Colonial Institution, of which the motto "United Empire" illustrates its aims, was founded in 1868. First among leading British statesmen to repudiate the old interpretation of colonial self-government as a preliminary to separation, Lord Beaconsfield, in 1872, spoke of the constitutions accorded to the colonies as "part of a great policy of Imperial consolidation." In 1875 Mr W. E. Forster, afterwards a member of the Liberal Government, made a speech in which he advocated Imperial federation as a means by which it might become practicable to "replace dependence by association." The foundation of the Imperial Federation League—in 1884, with Mr Forster for its first president, shortly to be succeeded by Lord Rosebery—marked a distinct step forward. The Colonial Conferences of 1887 and 1894, in which colonial opinion was sought and accepted in respect of important questions of Imperial organization and defence, and the enthusiastic loyalty displayed by the Colonies towards the Crown on the occasion of the jubilee manifestations of Queen Victoria's reign, were further indications of progress in the same direction. Coincidentally with this development, the achievements of Sir George Goldie and Mr Cecil Rhodes, who, the one in West Africa, and the other in South Africa, added between them to the empire in a space of less than twenty years a dominion of greater extent than the whole of British India, followed by the action of a host of distinguished disciples in other parts of the world, effectually stemmed the movement initiated by Cobden and Bright. A tendency which had seemed temporarily to point towards a complacent dissolution of the empire was arrested, and the closing years of the 19th century were marked by a growing disposition to appreciate the value and importance of the unique position which the British empire has created for itself in the world. No stronger demonstration of the reality of Imperial union can be needed than that which

was afforded by the support given to the Imperial forces by the Colonies and India in the South African war. It remains only to be seen by what process of evolution the further consolidation of the empire will find expression in the machinery of government.

The question of self-government is closely associated with the question of self-support. Plenty of good land and the liberty to manage their own affairs were the causes assigned by Adam Smith for the marked prosperity of the British Colonies towards the end of the 18th century. The same causes are still to be observed to produce the same effects, and it may be pointed out that since the date of the latest of Adam Smith's writings, upwards of 6,000,000 square miles of virgin soil, rich with possibilities of agricultural, pastoral, and mineral wealth, have been added to the empire. In the same period the white population has grown from about 12,000,000 to 52,000,000, and the developments of agricultural and industrial machinery have multiplied, almost beyond computation, the powers of productive labour.

It is scarcely possible within this article to deal with so widely varied a subject as that of the productions and industry of the empire. For the purposes of a

Industry and trade.

general statement, it is interesting to observe that concurrently with the acquisition of the vast continental areas during the 19th century, the progress of industrial science in application to means of transport and communication brought about a revolution of the most radical character in the accepted laws of economic development. Railways did away with the old law that the spread of civilization is necessarily governed by facilities for water carriage and is consequently confined to river valleys and sea-shores. Steam and electricity opened to industry the interior of continents previously regarded as unapproachable. The resources of these vast inland spaces which have lain untouched since history began became available to individual enterprise, and over a great portion of the earth's surface were brought within the possessions of the British empire. The production of raw material within the empire increased at a rate which can only be appreciated by a careful study of figures, some of which will be found under the headings of the UNITED KINGDOM and the principal British colonies and dependencies, and by a comparison of the total of these figures with the total figures of the world. The tropical and temperate possessions of the empire include every field of production which can be required for the use of man. There is no main staple of human food which is not grown; there is no material of textile industry which is not produced. The British empire gives occupation to more than one-third of the persons employed in mining and quarrying in the world. It may be interesting, as an indication of the relative position in this respect of the British empire to the world, to state that at present it produces one-third of the coal-supply of the world, one-sixth of the wheat supply, and very nearly two-thirds of the gold supply. But while these figures may be taken as in themselves satisfactory, it is far more important to remember that as yet the potential resources of the new lands opened to enterprise have been barely conceived, and their wealth has been little more than scratched. Population as yet has been only very sparsely sprinkled over the surface of many of the areas most suitable for white settlement. In the wheat lands of Canada, the pastoral country of Australasia, and the mineral fields of South Africa and Western Canada alone, the undeveloped resources are such as to insure employment to the labour and satisfaction to the needs of at least as many millions as they now contain thousands of the British race. In respect of this promise of the future the position of the British empire is unique.

In regard to the distribution of existing industry, although the more important Colonies have established manufactures of their own, of which the prosperity is assured, the general conditions have hitherto been maintained under which Great Britain has remained the manufacturing centre for the raw material of the whole. The primary production of the Colonies and the industrial development of Great Britain are still, therefore, the important divisions of the subject. These subjects are dealt with elsewhere in detail.

It is not too much to say that trade has been at once the most active cause of expansion and the most potent bond of union in the development of the empire. Trade with the tropical and settlement in the temperate regions of the world formed the basis upon which the foundations of the empire were laid. Trading companies founded most of the American and West Indian colonies; a trading company won India; a trading company colonized the north-western districts of Canada; commercial wars during the greater part of the 18th century established the British command of the sea, which rendered the settlement of Australasia possible. The same wars gave Great Britain South Africa, and chartered companies in the 19th century carried the British flag into the interior of the African continent from south and east and west. Trading companies produced Borneo and Fiji. The bonds of prosperous trade have kept the Australasian colonies within the empire. The protection of colonial commerce by the Imperial navy is one of the strongest of material links which connect the Crown with the outlying possessions of the empire.

The trade of the empire, like the other developments of Imperial public life, has been profoundly influenced by the variety of local conditions under which it has flourished. In the early settlement of the North American colonies their trade was left practically free; but by the famous Navigation Act of 1660 the importation and exportation of goods from British colonies were restricted to British ships, of which the master and three-fourths of the mariners were English. This Act, of which the intention was to encourage British shipping and to keep the monopoly of British colonial trade for the benefit of British merchants, was followed by many others of a similar nature up to the time of the repeal of the Corn Laws in 1846 and the introduction of free trade into Great Britain. And the Navigation Acts were repealed in 1849. Thus for very nearly two hundred years British trade was subject to restrictions, of which the avowed intention was to curtail the commercial intercourse of the empire with the world. During this period the commercial or mercantile system, of which the fallacies were exposed by the economists of the latter half of the 18th century, continued to govern the principles of British trade. Under this system monopolies were common, and among them few were more important than that of the East India Company. In 1813 the trade of India was, however, thrown open to competition, and in 1846, after the introduction of free trade at home, the principal British colonies which had not yet at that date received the grant of responsible government were specially empowered to abolish differential duties upon foreign trade. A first result of the commercial emancipation of the Colonies was the not altogether unnatural rise in the manufacturing centres of a school known as the Manchester school, which was disposed to question the value to Great Britain of the retention of colonies which were no longer bound to give her the monopoly of their commercial markets. An equally natural desire on the part of the larger colonies to profit by the opportunity which was opened to them of establishing local manufactures of their own, combined with the convenience in new countries

of using the customs as an instrument of taxation, led to something like a reciprocal feeling of resentment, and there followed a period during which the policy of Great Britain was to show no consideration for colonial trade, and the policy of the principal colonies was to impose heavy duties upon British trade. By a gradual process of better understanding, largely helped by the development of means of communication, the antagonistic extreme was abandoned, and a tendency towards a system of preferential duties within the empire displayed itself. At the Colonial Conference held in London in 1887, a proposal was formally submitted by the South African delegate for the establishment within the empire of a preferential system, imposing a duty of 2 per cent. upon all foreign goods, the proceeds to be directed to the maintenance of the Imperial navy. To this end it was requested that certain treaties with foreign nations which imposed restrictions on the trade of various parts of the empire with each other should be denounced. Some years later the treaties in question were denounced, but simultaneously with the movement in favour of reciprocal fiscal advantages to be granted within the empire by the many local governments to each other, there was a growth of the perception that an increase of the foreign trade of Great Britain, which is carried on chiefly in manufactured goods, was accompanied by a corresponding enlargement of the home markets for colonial raw material, and consequently that injury to the foreign trade of Great Britain must necessarily react upon the Colonies. This view was definitely expressed at the Colonial Conference at Ottawa in 1894, and made itself felt in the relinquishment of the demand that in return for colonial concessions there should be an imposition on the part of Great Britain of a differential duty upon foreign goods. Canada was the first important British colony to give substantial expression to the new Imperial sentiment in commercial matters by the introduction in 1897 of an Imperial tariff, granting without any reciprocal advantage a deduction of 25 per cent. upon customs duties imposed upon British goods. The same advantage is offered to all British colonies trading with her upon equal terms. Although in Great Britain trade is free, and customs duties are only imposed for purposes of revenue on a few selected articles, about half the national income is derived from customs and excise. In most of the Colonies customs form of necessity one of the important sources of revenue. It is, however, worthy of remark that in the self-governing colonies, even those which are avowedly Protectionist, a smaller proportion of the public revenue is derived from customs and excise than is derived from these sources at home. The proportion in Australasia before federation was about one-quarter. In Canada it is more difficult to estimate it, as customs and excise form the principal provision made for federal finance, and note must therefore be taken of the separate sources

of revenue in the provinces. With these reservations it will still be seen that customs, or, in other words, a tax upon the movements of trade, forms one of the chief sources of Imperial revenue. The development of steam shipping and electricity gave to the movements of trade a stimulus no less remarkable than that given by the introduction of railroads and industrial machinery to production and manufactures. Whereas at the beginning of the 19th century the journey to Australia occupied eight months, and business communications between Sydney and London could not receive answers within the year, the journey can now be accomplished in thirty-one days, and telegraphic despatches enable the most important business to be transacted within twenty-four hours. For one cargo carried in the year at the beginning of the 19th century at least six may now be carried by the same ship, and from the point of view of trade the difference of a venture which realizes its profits in two months, as compared with one which occupied a whole year, does not need to be insisted on. The increased rapidity of the voyage and the power of daily communication by telegraph with the most distant markets have introduced a wholly new element into the national trade of the empire, and commercial intercourse between the southern and the northern hemispheres has received a development from the natural alternation of the seasons, of which until quite recent years the value was not even conceived. Fruit, eggs, butter, meat, poultry, and other perishable commodities pass in daily increasing quantities between the northern and the southern hemispheres with an alternate flow which contributes to raise in no inconsiderable degree the volume of profitable trade. Thus the butter season of Australasia is from October to March, while the butter season of Ireland and Northern Europe is from March to October. In three years after the introduction of ice-chambers into the steamers of the great shipping lines, Victoria and New South Wales built up a yearly butter trade of £1,000,000 with Great Britain without seriously affecting the Irish and Danish markets whence the summer supply is drawn. These facilities, combined with the enormous additions made to the public stock of land and labour, contributed to raise the volume of trade of the empire from a total of less than £100,000,000 in the year 1800 to a total of nearly £1,500,000,000 in 1900. The declared volume of British exports to all parts of the world in 1800 was £38,120,120, and the value of British imports from all parts of the world was £30,570,605; total, £68,690,725. As in those days the Colonies were not allowed to trade with any other country this must be taken as representing Imperial trade. The exact figures of the trade of India, the Colonies, and the United Kingdom for 1900 were: imports, £809,178,209; exports, £657,899,363; total, £1,467,077,572.

The foregoing statements are summarized in statistical form in the following table:—

	The World.	The British Empire.	Proportion.
Area . . .	52,000,000 sq. m.	12,000,000	Something less than one-fourth
Population . . .	1,500,000,000	403,000,000	Something more than one-fourth
Trade . . .	2,862,143,000 (excluding Brit. empire)	1,467,077,572	About one-third
Revenue . . .	£950,203,000 (excluding Brit. empire)	246,273,405	„ one-fifth
Production of—			
Gold . . .	15,911,280 oz.	9,034,226	„ two-thirds
Wheat . . .	1,533,393,000 bush.	242,624,500	„ one-sixth
Coal . . .	723,617,836 net tons	239,995,148	„ one-third

A question of sovereign importance to the continued existence of the empire is the question of defence. A country of which the main thoroughfares are the oceans of the world demands in the first instance a strong

navy. It has of late years been accepted as a fundamental axiom of defence that the British navy should exceed in strength any reasonable combination of foreign navies which could be brought against it. The expense of maintaining

such a floating armament is colossal, and until within the decade 1890-1900 it was borne exclusively by the taxpayers of the United Kingdom. As the benefits of united empire have become more consciously appreciated in the Colonies, and the value of the fleet as an insurance for British commerce has been recognized, a desire manifested itself on the part of the self-governing colonies to contribute towards the formation of a truly Imperial navy. As yet the movement remains in its infancy. In 1895 the Australasian colonies voted a small subsidy of £126,000 per annum for the maintenance of an Australasian squadron, and in 1897 the Cape Colony also offered a contribution of £30,000 a year to be used at the discretion of the Imperial Govern-

ment for naval purposes. The Colonies have also contributed in some degree to their own naval defence by the erection of fortifications at selected points upon their shores. The net cost of the navy to the Imperial exchequer, as estimated for the year 1900-1901, was £27,522,600. Though available for service throughout the empire, and forming the principal bulwark of colonial defence, the cost, with the trivial exceptions named, is still borne exclusively by the Home Government, and recruiting for the navy is carried on wholly in the British isles.

The following comparative list of the navies of the world is taken from the *Statesman's Year-Book* for 1901:—

Strength of the Principal Navies of the World in April 1901.

Under the head of "afloat" all ships ready or nearly ready for sea are included. "Building" covers those still on the stocks or only just launched, which will not be completed for a year.

Land defence has hitherto been regarded as forming a secondary branch of the great question of Imperial defence. But though secondary it has been intimately connected with the development and internal growth of the empire. In the case of the first settlement of the American colonies they were expected to provide for their own land defence. To some extent in the early part of their career they carried out this expectation, and even on occasion, as in the taking of Louisburg, which was subsequently given back at the peace of Aix-la-Chapelle as the price of the French evacuation of Madras, rendered public service to the empire at large. In India the principle of local self-defence was from the beginning carried into practice by the East India Company. But in America the claim of the French was proved too heavy for local resources. In 1755 Great Britain intervened with troops sent from home under General Braddock, and up to the outbreak of the American war the cost of the defence of the North American colonies was borne by the Imperial exchequer. To meet this expense the Imperial parliament took upon itself the right to tax the American colonies. In 1765 a Quartering Act was passed by which 10,000 Imperial troops were quartered in the colonies. As a result of the American war which followed and led to the loss of the colonies affected, the Imperial authorities accepted the charge of the land defences of the empire, and with the exception of India and the Hudson Bay territories, where the trading companies determined to pay their own expenses, the whole cost of Imperial defence was borne, as the cost of the navy still is, by the taxpayers of the United Kingdom. This condition of affairs lasted till the end of the Napoleonic wars. During the thirty years' peace which followed there came time for reconsideration. The fiscal

changes which towards the middle of the 19th century gave to the self-governing colonies the command of their own resources very naturally carried with them the consequence that a call should be made on colonial exchequers to provide for their own governing expenses. Of these defence is obviously one of the most essential. Coincidentally, therefore, with the movements of free trade at home, the renunciation of what was known as the mercantile system and the accompanying grants of constitutional freedom to the colonies, a movement for the reorganization of Imperial defence was set on foot. In the decade which elapsed between 1846 and 1856 the movement as regards the colonies was confined chiefly to calls made upon them to contribute to their own defence by providing barracks, fortifications, &c., for the accommodation of Imperial troops, and in some cases paying for the use of troops not strictly required for Imperial purposes. In 1857 the Australian colonies agreed to pay the expenses of the Imperial garrison quartered in Australia. This was a very wide step from the Imperial attempt to tax the American colonies for a similar purpose in the preceding century. Nevertheless, in evidence given before a departmental committee in 1859, it was shown that at that time the Colonies of Great Britain were free from almost every obligation of contributing either by personal service or money payment towards their own defence, and that the cost of military expenditure in the Colonies in the preceding year had amounted in round figures to £4,000,000. A committee of the House of Commons sat in 1861 to consider the question, and in 1862 it was resolved without a division, that "colonies exercising the right of self-government ought to undertake the main responsibility of providing for their own internal order and security, and

ought to assist in their own external defence." The decision was accepted as the basis of Imperial policy. The first effect was the gradual withdrawing of Imperial troops from the self-governing colonies, together with the encouragement of the development of local military systems by the loan, when desired, of Imperial military experts. A call was also made for larger military contributions from some of the Crown colonies. The committee of 1859 had emphasized in its report the fact that the principal dependence of the Colonies for defence is necessarily upon the British navy, and in 1865, exactly 100 years after the Quartering Act, which had been the cause of the troubles that led to the independence of the United States, a "Colonial Naval Defence" Act was passed which gave power to the Colonies to provide ships of war, steamers, and volunteers for their own defence, and in case of necessity to place them at the disposal of the Crown. In 1868 the Canadian Militia Act gave the fully organized nucleus of a local army to Canada. In the same year the Imperial troops were withdrawn from New Zealand, leaving the colonial militia to deal with the native war still in progress. In 1870 the last Imperial troops were withdrawn from Australia, and in 1873 it was officially announced that military expenditure in the Colonies was almost "wholly for Imperial purposes." In 1875 an Imperial officer went to Australia to report for the Australian Government upon Australian defence. The appointment in 1879 of a royal commission to consider the question of Imperial defence, which presented its report in 1882, led to a considerable development and reorganization of the system of Imperial fortifications. Coaling stations were also selected with reference to the trade routes. In 1885 rumours of war roused a very strong feeling in connexion with the still unfinished and in many cases unarmed condition of the fortifications recommended by the commission of 1879. Military activity was stimulated throughout the empire, and the Colonial Defence Committee was created to supply a much-felt need for organized direction and advice to colonial administrations acting necessarily in independence of each other. The question of colonial defence was among the most important of the subjects discussed at the Colonial Conference held in London in 1887, and it was at this Conference that the Australasian colonies first agreed to contribute to the expense of their own naval defence. From this date the principle of local responsibility for self-defence has been fully accepted. With the exception of Natal all the self-governing colonies have provided practically for their own military requirements. India has its own native army, and pays for the maintenance within its frontiers of an Imperial garrison. Early in the summer of 1899, when hostilities in South Africa appeared to be imminent, the governments of the principal Colonies took occasion to express their approval of the policy pursued by the Imperial Government, and offers were made by the governments of India, the Australasian colonies, Canada, Hong-Kong, the Federal Malay states, some of the West African and other colonies, to send contingents for active service in the event of war. On the outbreak of hostilities these offers, on the part of the self-governing Colonies, were accepted, and colonial contingents upwards of 30,000 strong were among the most efficient sections of the British fighting force. The manner in which these colonial contingents were raised, their admirable fighting qualities, and the service rendered by them in the field, have disclosed altogether new military possibilities within the empire, and the reorganization of the army on an Imperial footing is among the more probable developments of the near future.

As at present organized the army is divided into two

main sections, namely, the British and the Indian armies, of which the strength is roughly as follows, though for fuller details reference should be made to the article *ARMIES* :—

British.

Regular forces, home and colonial	203,852
Army reserve, 1st class	90,000
Militia	139,237
Yeomanry	11,907
Volunteers	265,061
Total, home and colonial	710,057
Regular forces on Indian establishment	73,484
	783,541

Indian Army.

Regular forces on Indian establishment already noted.

Native Army.

	European Officers.	Native Officers.	Non-commissioned Officers and Privates.	Total.
Artillery	33	54	2,001	2,088
Cavalry	358	619	21,955	22,932
Sappers and miners	65	488	3,142	3,695
Infantry	1122	2048	108,755	111,925
Total native army	1578	3209	135,853	140,640

The feudatory and dependent native states have native armies of their own which, according to the latest available estimates, number about 350,000 men, with upwards of 4000 guns. Offers of military service in South Africa in 1900 were received from some of the principal feudatory states.

Special expenditure has been made by the Indian Government upon coast defences armed with modern breechloading guns. Large sums have also been spent upon external and border defences, and an establishment of two coast-defence ironclads, a despatch vessel, two first-class torpedo gunboats, seven first-class torpedo boats, as well as armed gunboats, &c., is maintained.

With the exceptions of Natal and the garrisons of the naval stations of Cape Town and Halifax, no imperial garrisons are under normal conditions maintained in the self-governing Colonies. In the Crown Colonies garrisons are maintained in Gibraltar, Malta, Mauritius, Sierra Leone, St Helena, Ceylon, Straits Settlements, Hong-Kong, and the West Indies. There are Imperial naval stations at Simon's Bay, Trincomalee, Bermuda, Esquimalt, Halifax, Malta, Gibraltar, St Lucia, Ascension, Hong-Kong, and Wei-hai-Wei.

The important questions of justice, religion, and instruction will be found dealt with in detail under the headings of separate sections of the empire. Systems of justice throughout the empire have a close resemblance to each other, and the Privy Council of the House of Lords, on which the self-governing colonies and India are represented, constitutes a Supreme Court of Appeal for the entire empire; but common law varies according to its origin in some important divisions. Religion, of which the forms are infinitely varied, is everywhere free, except in cases where the exercise of religious rites leads to practices foreign to accepted laws of humanity. Systems of instruction of which the aim is generally similar in the white portions of the Empire, and is directed towards giving to every individual the basis of a liberal education, are governed wholly by local requirements. Native schools are established in all settled communities under British rule.

(F. L. S.)

Briton-Ferry, a seaport and railway station in the Mid parliamentary division of Glamorganshire, Wales, at the mouth of the Neath river, $2\frac{1}{2}$ miles S. of Neath. There are four Episcopalian churches, and Baptist, Congregational, Methodist, and Bible Christian chapels. There are coal mines and iron, steel, and tin-plate works. The dock belongs to the Great Western Railway Company, and is 13 acres in extent. Area of parish (an urban district), 1593 acres. Population (1881), 6061; (1901), 7000.

Brive, or Brive-la-Gaillarde, chief town of arrondissement, department Corrèze, France, 18 miles S.W. of Tulle; an important railway centre on the main line from Paris to Toulouse. A statue has been erected to Marshal Brune, a native of the town. Manufactures include straw work in great variety. Population (1881), 9598; (1891), 11,142; (1901), 19,496.

Brixen (Italian, *Bressanone*), chief town of a district of the same name in Tirol. Population of district (1890), 27,050, (1900), 27,691; and of commune (1890), 5525, (1900), 5767. Corn, fruit and viticulture, and the breeding of the silk-worm, are the leading industries. It is a favourite health resort in spring and autumn, on account of its mild climate.

Brixham, a market town in the Torquay parliamentary division of Devonshire, England, on the south side of Tor Bay, 30 miles S. of Exeter. The Western Counties Home for the orphan boys of seamen (1859) has been enlarged and a market building erected. Area of parish (an urban district), 5612 acres. Population (1881), 7033; (1901), 8622.

Broach, or BHARUCH, an ancient city and modern district of British India, in the Gujarat division of Bombay. The city is on the right bank of the Narbada, about 30 miles from the sea, and 203 miles N. of Bombay. The area, including suburbs, occupies 3 square miles. Population (1881), 37,281; (1891), 40,168; (1901), 42,298. The sea-borne trade is now confined to a few coasting vessels. Handloom weaving is almost extinct, but four cotton mills have been opened, with 800 looms and 70,000 spindles, employing 1450 hands. There are also five large flour mills. The English high school, called after a munificent Parsee, was attended in 1896-97 by 290 pupils.

The district of BROACH contains an area of 1463 square miles. The population in 1891 was 341,490, being 233 persons per square mile. According to religion, Hindus numbered 245,422; Mahomedans, 71,263; Parsees, 3273; Jains, 3576; Christians, 128, including 31 Europeans; "others," 17,828. In 1901 the population was 291,428, showing a decrease of 15 per cent., compared with an increase of 5 per cent. in the preceding decade. The total amount of land revenue and rates was returned as Rs.28,31,477, the incidence of assessment being Rs.4:2:5 per acre; the number of police was 508. In 1897-98, out of a total cultivated area of 567,228 acres, only 879 were irrigated from wells, &c. The principal crops are cotton, millet, wheat, and pulse. Dealing in cotton is the chief industry, the dealers being organized in a guild. Besides the cotton mills in Broach city there are about 20 factories for ginning and pressing cotton, some of them on a very large scale. The district is traversed throughout its length by the Bombay and Baroda railway, which crosses the Narbada opposite Broach city on an iron girder bridge of 67 spans. In 1897-98 there were 263 schools, with 19,773 pupils, showing one village with a school to every 7 square miles of area, and 6.12 pupils to every hundred of the population. There were four printing-presses, issuing three newspapers in

the vernacular. The municipalities had a total income of Rs.1,69,959, the incidence of taxation being R.1:8:8 per head. For 1897 the death-rate was 34 per thousand, rising to 41 in Broach city. The district suffered severely from the famine of 1899-1900.

Broadstairs, a town and watering-place in the Isle of Thanet parliamentary division of Kent, 3 miles S.W. of Margate, on the South-Eastern and Chatham railway. From 1837 to 1851 Broadstairs was a favourite summer resort of the novelist Dickens, who, in a sketch called "Our English Watering-Place," described it as a place "left high and dry by the tide of years." This sea-side village, with its "semi-circular sweep of houses," has grown into a considerable town owing to the influx of summer visitors, for whose entertainment there are, besides the "Albion" mentioned by Dickens, a Grand Hotel, numerous inns and boarding-houses, libraries, a bathing establishment, and a fine promenade. Area of urban district, 1442 acres. Population (1881), 4322; (1891), 5234; (1901), 6460.

Brockton, a city of Plymouth county, Massachusetts, U.S.A., 20 miles S. of Boston, and containing an area of .21 square miles of rolling surface. One of the many lines of the New York, New Haven, and Hartford railway passes through it. It is an important manufacturing place, the making of boots and shoes being the most important branch of industry. Brockton was settled about 1700, and was incorporated as a town under the name of North Bridgewater. This was changed to Brockton in 1874. In 1881 it received a city charter. The assessed valuation of real and personal property in 1900 was \$27,868,799, the tax-rate \$20.10 per \$1000, and the net debt \$1,946,872. Population (1880), 13,608; (1890), 27,294; (1900), 40,063, of whom 9484 were foreign-born. The death-rate in 1900 was 13.2.

Brockville, a town and port of entry of Ontario, Canada, and capital of Leeds county, situated 119 miles S.W. of Montreal, on the left bank of the St Lawrence, and on the Grand Trunk, Canadian Pacific, and Brockville and Westport railways. It has steamer communication with the St Lawrence and Lake Ontario ports. The principal manufactures are hardware, furnaces, agricultural implements, carriages, sulphuric acid, &c. The value of imports for 1899-1900 was \$1,111,461; exports, \$460,948. Population (1881), 7609; (1891), 8791; (1901), 8940.

Bród, a town of Croatia Slavonia, Hungary, near the river Save. As chief town for the transit trade in cereals, prunes, wood, and wine between Hungary and Bosnia, it is rapidly rising in importance. The railway crosses the river at this point. Population, 7310.

Brody, chief town of district of same name in the Austrian crown-land of Galicia, near the Russian frontier. Population of district (1890), 130,707; (1900), 133,865; of town (1890), 17,534; (1900), 17,360. The latter is for the most part German-speaking, about two-thirds being Jews. There is a garrison of 888 men. It is one of the most important commercial centres in Galicia, particularly for the trade with Russia, which furnishes corn, furs, and wool, receiving in return Austrian cottons, silks, agricultural implements, leather goods, jewellery, &c. There has, however, been a marked decline both in imports and exports since 1879, when its charter as a free commercial city was withdrawn, its position being further damaged by the construction of the railway *via* Tarnopol.

Brogie, Jacques Victor Albert; DUC DE (1821-1901), French statesman and historian, the eldest son of Achille Charles Léonce Victor, duc de Broglie, was born in Paris on 13th June 1821. After a brief

diplomatic career at Madrid and Rome, the revolution of 1848 caused him to withdraw from public life and devote himself to literature. He had already published a translation of the religious system of Leibnitz (1846). He now at once made his mark by his contributions to the *Revue des Deux Mondes*, and the Orleanist and clerical organ *Le Correspondant*, which were afterwards collected under the titles of *Études morales et littéraires* (1853), and *Questions de religion et d'histoire* (1860). These were supplemented in 1869 by a volume of *Nouvelles études de littérature et de morale*. His *L'Église et l'Empire romain au IV^e siècle* (1856-66) brought him the succession to Lacordaire's seat in the Academy in 1862. In 1870 he succeeded his father in the dukedom, having previously been known as the prince de Broglie. In the following year he was elected to the National Assembly for the department of the Eure, and a few days later (19th February) was appointed ambassador to the Court of St James's; but in March 1872, in consequence of criticisms upon his negotiations concerning the commercial treaties between England and France, he resigned his post and took his seat in the National Assembly, where he became the leading spirit of the monarchical campaign against Thiers. On the replacement of the latter by Marshal MacMahon, the duc de Broglie became president of the Council and minister for Foreign Affairs (May 1873), but in the reconstruction of the ministry on 26th November, after the passing of the septennate, transferred himself to the ministry of the Interior. His tenure of office was marked by an extreme Clericalism and Conservatism, which roused the bitter hatred of the Republicans, while he alienated the Legitimist party by his friendly relations with the Bonapartists, and the Bonapartists by an attempt to effect a compromise between the rival claimants to the monarchy. The result was a coalition, which overthrew the Cabinet on 16th May 1874. Three years later (16th May 1877) he was entrusted with the formation of a new Cabinet, with the object of appealing to the country and securing a new Chamber more favourable to the reactionaries than its predecessor had been. The result, however, was a decisive Republican majority. The duc de Broglie was defeated in his own district, and resigned office on 20th November. From this time he gradually dropped out of politics and reverted to his former historical studies. Besides editing the *Souvenirs* of his father (1886, &c.), the *Mémoires* of Talleyrand (1891, &c.) and the letters of the Duchess Albertine de Broglie (1896), he published *Le secret du Roi. Correspondance secrète de Louis XV. avec ses agents diplomatiques, 1752-74* (1878); *Frédéric II. et Marie Thérèse* (1883); *Frédéric II. et Louis XV.* (1885); *Marie Thérèse Impératrice* (1888); *Histoire et diplomatie* (1889); *Le père Lacordaire* (1889); *Maurice de Saxe et le marquis d'Argenson* (1891); *La Paix d'Aix-la-Chapelle* (1892); *Le Concordat* (1893); *L'Alliance Autrichienne* (1895); *La Mission de M. de Gontaut-Biron à Berlin* (1896); *Histoire et politique* (1897); *La Journée de Fontenoy* (printed for private circulation, 1897); *Malherbe*, in the series of "Les grands Ecrivains Français" (1897); *Voltaire avant et pendant la Guerre de Sept Ans* (1898); *Saint Ambroise*, translated by Margaret Maitland in the series of "The Saints" (1899). He died in Paris on 19th January 1901. (H. S.)

Broken Hill, a silver-mining town in New South Wales, Australia, about 925 miles W. of Sydney. One of the neighbouring mines is the most prolific in the world. Gold is associated with the silver, and fairly good copper lodes are found. The problem of the profitable treatment of the sulphide ores has been practically solved here. The Barrier mines employ over 7000 men, and

claim 27 per cent. of the lead production of the world. Population (1901), 27,518.

Brokers.—In the primary sense of the word a broker is a mercantile agent, of the class known as general agents, whose office is to bring together intending buyers and sellers and make a contract between them, for a remuneration called brokerage or commission; e.g., cotton brokers, wool brokers, or produce brokers. Originally the only contracts negotiated by brokers were for the sale or purchase of commodities; but the word in its present use includes other classes of mercantile agents, such as stock-brokers, insurance-brokers, ship-brokers, or bill-brokers. Pawnbrokers are not brokers in any proper sense of the word; they deal as principals and do not act as agents. In discussing the chief questions of modern legal interest in connexion with brokers we shall deal with them, firstly, in the original sense.

1. *Relations between Broker and Principal.*—A broker has not, like a factor, possession of his principal's goods, and cannot buy or sell in his own name; his business is to bring into privity of contract his principal and the third party. When the contract is made ordinarily he drops out altogether. Brokers very frequently act as factors also, but, when they do so, their rights and duties as factors must be distinguished from their rights and duties as brokers. It is a broker's duty to carry out his principal's instructions with diligence, skill, and perfect good faith. He must see that the terms of the bargain accord with his principal's orders from a commercial point of view, e.g., as to quality, quantity, and price; he must ensure that the contract of sale effected by him be legally enforceable by his principal against the third party; and he must not accept any commission from the third party, or put himself in any position, in which his own interest may become opposed to his principal's. As soon as he has made the contract which he was employed to make, ordinarily his duty to, and his authority from, his principal alike cease; and consequently the law of brokers relates principally to the formation of contracts by them.

The most important formality in making contracts for the sale of goods, with which a broker must comply, is contained in section 4 of the Sale of Goods Act, 1893, which (in substance re-enacting section 17 of the Statute of Frauds) provides as follows:—"A contract for the sale of any goods of the value of ten pounds or upwards shall not be enforceable by action unless the buyer shall accept part of the goods as sold, and actually receive the same, or give something in earnest to bind the contract, or in part payment, or *unless some note or memorandum in writing of the contract be made and signed by the party to be charged or his agent in that behalf.*"

From the reign of James I. till 1884 brokers in London were admitted and licensed by the Corporation, and regulated by statute; and it was common to employ one broker only, who acted as intermediary between, and was the agent of both buyer and seller. When the Statute of Frauds was passed in the reign of Charles II., it became the practice for the broker, acting for both parties, to insert in a formal book kept for the purpose a memorandum of each contract effected by him, and to sign such memorandum on behalf of both parties, in order that there might be a written memorandum of the contract of sale, signed by the agent of the parties as required by the statute. He would then send to the buyer a copy of this memorandum, called the "bought note," and to the seller a "sold note," which would run as follows:—

"I have this day bought for you from A B [or "my principal"]
..... [signed] "M, Broker."
"I have this day sold for you to A B [or "my principal"].....
[signed] "M, Broker."

There was in the earlier part of the 19th century considerable discussion in the courts as to whether the entry in a broker's book, or the bought and sold notes (singly or together), constituted the statutory memorandum; and judicial opinion was not unanimous on the point. But at the present day brokers are no longer regulated by statute, either in London, or elsewhere, and keep no formal book; and as an entry made in a private book kept by the brokers for another purpose, even if signed, would probably not be regarded as a memorandum signed by the agent of the parties in that behalf, the old discussion is now of little practical interest.

Under modern conditions of business the written memorandum of the contract of sale effected by the broker is usually to be found in a "contract note"; but the question whether, in the particular circumstances of each case, the contract note affords a sufficient memorandum in writing, depends upon a variety of considerations—e.g., whether the transaction is effected through one or through two brokers; whether the contract notes are rendered by one broker only, or by both; and, if the latter, whether exchanged between the brokers, or rendered by each broker to his own client; for under present practice any one of these methods may obtain, according to the trade in which the transaction is effected, and the nature of the particular transaction.

Where one and the same broker is employed by both seller and buyer, bought and sold notes rendered in the old form provide the necessary memorandum of the contract. Where two brokers are employed, one by the seller and one by the buyer, sometimes one drops out as soon as the terms are negotiated, and the other makes out, signs, and sends to the parties the bought and sold notes. The latter thus becomes the agent of both parties for the purpose of signing the statutory memorandum, and the position is the same as if one broker only had been employed. On the other hand, if one broker does not drop out of the transaction, each broker remains to the end the agent of his own principal only, and neither becomes the agent of the other party for the purpose of signing the memorandum. In such a case it is the usual practice for the buyer's broker to send to the seller's broker a note of the contract,—“I, acting on account of A. B. [or, ‘of my principal,’], have this day bought from you, acting on account of C. D. [or ‘of your principal,’],” —and to receive a corresponding note from the seller's broker. Thus each of the parties receives through his own agent a memorandum signed by the other party's agent. These contract notes, as they are called, are not “bought” and “sold” notes, as originally understood; for the “bought note” proper was sent to the buyer, and ran:—“I have this day bought for you” and the sold note was sent to the seller, and ran—“I have this day sold for you.” But they are usually known as, and serve the purpose of, “bought” and “sold” notes.

In all the above three cases the broker's duty of compliance with all formalities necessary to make the contract of sale legally enforceable is performed, and both parties obtain a written memorandum of the contract upon which they can sue. But in certain Exchanges governed by a close association which excludes strangers from its market, all members of the association, whether brokers or merchants, are by the custom or rules of the Exchange treated as principals amongst themselves; and the bargains they make are enforced on the market by the governing body of the Exchange, whether legal formalities such as the signed memorandum are complied with or not; and it thus becomes, from the broker's point of view, unnecessary to comply with legal requirements which are not insisted upon on the market. If he complies with the rules of the association he knows his contracts will be enforced. The domestic takes the place of the public forum. So the practice has arisen on certain Exchanges, at least in reference to certain classes of transactions, for the brokers making contracts on the market, instead of rendering to each other duly signed contract notes, merely to enter the bargain each in his own private market book. Such entries are usually checked by subsequent comparison, and bargains so made are enforced by the governing body. So long as the two brokers remain solvent, the contract is, as between them, performed on the market.

In contracts for future delivery, at each periodical “settlement” up to the date of delivery, “differences” are paid, by one broker to the other, through the clearing house of the exchange, **Differences.** i.e., the difference between the contract price and the market price at the settlement, or between the last and the present settlement prices. When the date of delivery arrives, if the selling principal be a stranger to the market and fail to deliver, his broker is compelled by the rules of the Exchange to make good to the buying broker any loss due to a rise of the market. Similarly if the buying principal refuses to take delivery, and the market has fallen, the buying broker must make good to the selling broker the consequent loss. But when an agent receives money on his principal's behalf, it is his duty to account for it, and the statutory requirement of a memorandum in writing does not apply to prevent a principal from suing his agent for money received to his use. Thus, so long as the two brokers remain solvent, the contract of sale, though by reason of the absence of any statutory memorandum, legally unenforceable by one principal against the other, is, in fact, indirectly enforced. But if the selling broker becomes insolvent, the seller must suffer loss; for *ex hypothesi* the seller cannot enforce the contract directly against the buyer, and his remedy against his broker becomes a mere right of proof against an insolvent estate. Again, should the buying broker become insolvent, then, if the seller has employed his broker on the terms that all rules and customs of the market are to be read into the contract of employment (which question is dealt with below), the seller cannot complain that his broker has,

in conformity to those rules and customs, omitted to make for him a contract which he can enforce at law directly against the buyer; and his only right will be to recover from his broker the money which the latter receives on his account, viz., the dividends paid by the insolvent estate of the buying broker. On the principal markets it also very often happens in dealings in “futures” that one purchase may be made through several intermediate brokers, who sell first, and then buy against their contract of sale from another broker. In such a case, the first buying broker and the last selling broker are alone in direct relations with the two principals. The intermediate brokers act as principals towards each other according to the rules of the Exchange, and when their bargain is made, drop out of the transaction, usually at the next periodical settlement. Ultimately the position is precisely the same as if only two brokers had been employed from the start, and the remarks made above as to that position apply.

When two brokers are employed, it is commonly the practice (except when one broker drops out, and the other signs bought and sold notes on behalf of both parties) for each broker to send to his principal a contract note, either in the form of the old bought and sold notes—“I have bought for you,”—or in a form which purports to make himself a principal instead of agent in relation to his client,—“I have this day sold to you.” These contract notes, though often so spoken of, are not really bought and sold notes; for the buying broker is not the agent of the seller, and the selling broker is not the agent of the buyer, for the purpose of signing such notes. They are memoranda not of the contract of sale, but of the contract of employment, and contain the terms upon which the broker is employed by his principal. Sometimes they are accompanied by a detachable form, known as the “client's return contract note,” to be filled in, signed, and returned by the client; but even the “client's return contract note” is retained by the client's own broker, and is only a memorandum of the terms of employment. The following is a form of contract note rendered by a broker to his client for American cotton, bought on the Liverpool Cotton Exchange for future delivery. The client's contract note is attached to it, and is in precisely corresponding form.

AMERICAN COTTON,
Delivery Contract Note.

Liverpool,

M.....

DEAR SIR,

We have this day..... to you

.....lb's American Cotton, net weight, to be contained in.....American Bales, more or less, to be delivered in Liverpool, during.....on the basis of.....per lb for.....on the terms of the rules, bye-laws, and Clearing House regulations of the Liverpool Cotton Association, Limited, whether endorsed hereon or not.

The contract, of which this is a note, is made between ourselves and yourselves, and not by or with any person, whether disclosed or not, on whose instructions or for whose benefit the same may have been entered into. Yours faithfully,

The contract, of which the above is a note, was made on the date specified, within the business hours fixed by the Liverpool Cotton Association, Limited.

.....per cent. to us.

Please confirm by signing and returning the contract attached.

Prima facie, as already stated, it is the duty of a broker, employed to buy, to make with an actual seller, either direct or through another broker, a contract of sale which is legally enforceable at the instance of the buyer. And **Custom-ary usage.** if the buyer did not consent to employ his broker on the terms that he should act according to the rules and customs of the market, the broker would be guilty of a breach of duty, if, in obedience to such rules or customs, he omitted to procure a statutory memorandum. Such consent may be given expressly by the client, before he instructs his broker to execute any order. He may say, “I consent to your following all the rules and customs of your Exchange and am willing to be bound by them.” In such a case the client could not complain if his broker did follow those rules and customs, and he would be bound by them, whether the rules and customs were expressed *in extenso* in the contract of employment, or incorporated by reference as in the above form of contract note for “delivery cotton.” But it is also a rule of law, that trade contracts are to be construed subject to trade usages, and the contract of employment of the broker is therefore impliedly made subject to the usages of the broker's trade, whether the client is already aware of these usages or not. This legal implication is, however, subject to the limitation,

that the contract shall not be construed as incorporating any custom or usage which, in the opinion of the court, is unreasonable, unless the party to be bound by it actually knew of it beforehand, or by his conduct is precluded from saying that he did not know of it. A custom which is inconsistent with the fundamental nature of the contract is considered by the courts as unreasonable; e.g., a custom that a broker employed to buy as broker may convert himself into a principal contracting party and sell to his client on his own account. The "principal" clause in the above form of contract note would not be binding unless assented to. So also the practice above mentioned by which the broker omits to obtain a properly signed memorandum of the contract upon which his principal can sue, would be held unreasonable. The important question therefore which arises in considering the duty of a broker to his client, is, in practice usually, whether the client has actually consented (or must be taken to have consented) to be bound by some usage which is unreasonable, and would not bind him without that consent. This is a question of fact in each case, and depends on what notice the client has had of the particular usage. It is chiefly as evidence of consent, or at any rate of notice, that the printed forms of contract notes sent by brokers to their clients incorporating the rules and customs of the Exchange or market, are important. If in any case it appears that the printed forms have been brought to the previous notice of the client, there will be evidence (of which the force will no doubt differ according to the circumstances of every case) from which to infer the client's consent to the customs and rules referred to in the form. If the client receives and signs a "return note," the evidence of his consent becomes practically conclusive. In this context, however, the rule of evidence should not be forgotten, that a contract in writing cannot be varied by extrinsic evidence; and therefore if the terms upon which the broker is employed have previously been reduced to writing, evidence whether oral or written of usages or rules inconsistent with those terms will be inadmissible; and even if a client signed such a "return note" as above mentioned, the reference therein to the rules and usages of the particular market would not serve to alter the contract already made; nor would it constitute a new contract, for there would be no fresh consideration.

The broker, on performing his duty in accordance with the terms upon which he is employed, is entitled to be paid his brokerage. This usually takes the form of a percentage, varying according to the nature of business, upon the total price of the goods bought or sold through him. When he guarantees the solvency of the other party, he is said to be employed upon *del credere* terms, and is entitled to a higher rate of remuneration. If he fails to perform his duty, he loses his right to remuneration, reimbursement, and indemnity, and further becomes liable to an action for damages for breach of his contract of employment, at the suit of his principal. The measure of damages will, in the absence of any special arrangement, be the difference between the contract price and the market price at the time of the breach. In some trades it is the custom for the selling broker to receive payment from the buyer or his broker; and in such case it is his duty to account to his principal for the purchase money. A broker who properly expends money or incurs liability on his principal's behalf in the course of his employment, is entitled to be reimbursed the money, and indemnified against the liability. Not having, like a factor, possession of the goods, a broker has no lien by which to enforce his rights against his principal.

2. *Relations between Broker and Third Party.*—A broker who signs a contract note as broker on behalf of a principal, whether named or not, is not personally liable on the contract to the third party. But if he makes the contract in such a way as to make himself a party to it, the third party may sue either the broker or his principal, subject to the limitation that the third party, by his election to sue one, precludes himself from suing the other. In this respect the ordinary rules of the law of agency apply to a broker. Brokers who are members of Exchanges are personally liable to any member with whom they contract, whether he be a merchant or a broker; because by joining the association each member contracts to be bound by the rules, one of which is that all members are between themselves principals. Generally, a broker has

not authority to receive payment, but in certain trades it is customary for him to do so, and in such trades if the buyer pays the seller's broker, and is then sued by the seller for the price by reason of the broker having become insolvent or having absconded, he may set up the payment to the broker as a defence to the action by the broker's principal. A payment by the buyer to his own broker is no defence to an action by the seller unless the seller has led the buyer to believe that he has already settled with the buyer's broker. Brokers may render themselves liable for damages in tort for the conversion of the goods at the suit of the true owner if they negotiate a sale of the goods for a selling principal who has no title to the goods.

A stockbroker is a broker who contracts for the sale of stocks and shares. Stockbrokers differ from brokers proper chiefly in that stocks and shares are not "goods," and the requirement of a memorandum in writing, enacted by the Sale of Goods Act, 1893, does not apply. Hence actions may be brought by the principals to a contract for the sale of stocks and shares although no memorandum in writing exists. For instance, the jobber, on failing to recover from the buyer's broker the price of shares sold, by reason of the broker having failed and been declared a defaulter, may sue the buyer whose "name was passed" by the broker. The employment of a stockbroker is subject to the rules and customs of the Stock Exchange, in accordance with the principles discussed above, which apply to the employment of brokers proper. A custom which is illegal, such as the Stock Exchange practice of disregarding Leeman's Act, which enacts that contracts for the sale of joint-stock bank shares shall be void unless the registered numbers of the shares are stated therein, is not binding on the client to the extent of making the contract of sale valid. But if a client choose to instruct his broker to buy bank shares in accordance with that practice, the broker is entitled to be indemnified by his client for money which he pays on his behalf, even though the contract of sale so made is unenforceable. For further information the reader is referred to the article and to the treatises on the law of the STOCK EXCHANGE.

An insurance broker is an agent whose business is to effect policies of marine insurance. He is employed by the person who has an interest to insure, pays the premiums to the underwriter, takes up the policy, and receives from the underwriter payment in the event of a loss under the policy. By the custom of the trade the underwriter looks solely to the broker for payment of premiums, and has no right of action against the assured; and, on the other hand, the broker is paid his commission by the underwriter, although he is employed by the assured. Usually the broker keeps a current account with the underwriter, and premiums and losses are dealt with in account. It is only in the event of the underwriter refusing to pay on a loss, that the broker drops out and the assured sues the underwriter direct.

Ship-brokers are, firstly, "commission agents," and, secondly, very often also ships' managers. Their office is to act as agents for owners of ships to procure purchasers for ships, or ships for intending purchasers, in precisely the same manner as house-agents act in respect of houses. They also act as agents for ship-owners in finding charterers for their ships, or for charterers in finding ships available for charter, and in either case they effect the charter-party (see AFFREIGHTMENT).

Chartering brokers are customarily paid by the ship-owner, when the charter-party is effected, whether originally employed by him or by the charterer. Charter-parties effected through brokers often contain a provision—"2½ per cent. on estimated amount of freight to be paid to A B, broker, on the signing of this charter-party, and the ship to be consigned to him for ship's business at the port of X [inserting the name of the port where A B carries on business]." The broker cannot sue on the charter-party contract because he is not a party to it, but the insertion of the clause practically prevents his right from being disputed by the ship-owner. When the broker does the ship's business in port, it is his duty to clear her at the customs and generally to act as "ship's husband."

A bill-broker was originally an agent who, for a commission, procured for country bankers the discounting of their bills in London. But the practice arose of the broker guaranteeing the London banker or financier; and finally the brokers ceased to deposit with the London bankers the bills they received, and at the present day a bill-broker, as a rule, buys bills on his own account at a discount, borrows money on his own account and upon his own security at interest, and makes his profit out of the difference between the discount and the interest. When acting thus the bill-broker is not a broker at all, as he deals as principal and does not act as agent.

(L. F. S.)

Bromberg, a town of Prussia, province of Posen, 32 miles by rail W.N.W. from Thorn, 7 miles W. from the bank of the Vistula. The new buildings include a theatre (1896) and a synagogue (1884). The town possesses a bronze statue of Frederick the Great (1862), a bronze equestrian statue of the Emperor William I. (1893), a monument of the war of 1870-71 (1880), and a statue of Benkenhoff (1894), the constructor of the Bromberg Canal (1773-74), connecting the Vistula and the Netze, with a length of 17 miles. There is also an archaeological collection belonging to the Historical Society of the Netze District. The principal industrial works are iron foundries and machine shops, paper factories, and flour mills; the town has an active trade in agricultural and other products. Population (1885), 36,294; (1900), 52,082.

Bromley, a suburban market town in the Sevenoaks parliamentary division of Kent, England, 10 miles S.S.E. of London by rail. Recent erections are a science and art school, a drill-hall, a public library, and four new churches, besides a Roman Catholic church and several chapels. The cottage hospital has been enlarged and a recreation ground purchased. Population of parish (an urban district) (1881), 15,154; (1891), 21,684; (1901), 27,358.

Bromsgrove, ancient market town in the Bromsgrove parliamentary division of Worcestershire, England, 13 miles S.W. by S. of Birmingham by rail, and 13 miles N. by W. of Worcester. Amongst recent erections are a cottage hospital and a school of art. Birmingham Sanatorium stands in the parish. Near the town are carriage works belonging to the Midland railway. Area of urban district, 1122 acres. Population (1901), 8416.

Brongniart, Adolphe Théodore (1801-1876) French botanist, was born in Paris on 14th January 1801. His father, Alexander Brongniart, at that time director of the imperial pottery at Sèvres, being a well-known scientific man, young Adolphe grew up in a scientific atmosphere. He soon showed an inclination toward the study of the natural sciences, devoting himself at first more particularly to geology, and later, to botany, thus equipping himself for what was to be the main occupation of his life—the investigation of fossil plants. In 1826 he graduated as Doctor of Medicine with a dissertation on the Rhamnaceæ; but the career which he adopted was botanical, not medical. In 1831 he became assistant to Desfontaines at the Muséum d'Histoire Naturelle, and two years later succeeded him as professor, a position which he continued to hold until his death on 18th February 1876. Brongniart was an indefatigable investigator and a prolific writer, so that he left behind him, as the fruit of his labours, a large number of books and memoirs. Of these, the great majority refer to palæobotany, a study with which his name will ever be associated. As early as 1822 he published a paper on the classification and distribution of fossil plants (*Mém. Mus. Hist. Nat.* viii.). This was followed by several papers chiefly bearing upon the relation between extinct and existing forms; a line of research which culminated in the publication of the *Histoire des Végétaux Fossiles*, which has earned for him the title of "father of palæobotany." This great work was heralded by a small but most important "Prodrome" (contributed to the *Grand Dictionnaire d'Hist. Nat.*, 1828, t. lvii.) which brought order into chaos by a classification in which the fossil plants were arranged, with remarkably correct insight, along with their nearest living allies, and which forms the basis of all subsequent progress in this direction. It is of

especial botanical interest, because, in accordance with Robert Brown's discoveries, the Cycadeæ and Coniferae are here placed in the new group *Phanérógames gymnospermes*. In this book attention is also directed to the succession of forms in the various geological periods, with the important result (stated in modern terms) that in the Palæozoic period the Pteridophyta are found to predominate; in the Mesozoic, the Gymnosperms; in the Cainozoic, the Angiosperms, a result subsequently more fully stated in his "Tableau des Genres de Végétaux Fossiles" (D'Orbigny, *Dict. Univ. d'Hist. Nat.*, 1849). But the great *Histoire* itself was not destined to be more than a colossal fragment; the publication of successive parts proceeded regularly from 1828 to 1837, when the first volume was completed; but after that only three parts of the second volume appeared. Brongniart no doubt was overwhelmed with the continually increasing magnitude of the task that he had undertaken. Apart from his more comprehensive works, his most important palæontological contributions are perhaps his observations on the structure of *Sigillaria* (*Arch. Mus. Hist. Nat.* i., 1839) and his researches (almost the last he undertook) on fossil seeds of which a full account was published posthumously in 1880. His activity was by no means confined to palæobotany, but extended into all branches of botany, more particularly anatomy and phanerogamic taxonomy. Among his achievements in these directions, the most notable is the memoir "Sur la génération et le développement de l'embryon des Phanérógames" (*Ann. Sci. Nat.* xii., 1827). This is remarkable in that it contains the first account of any value of the development of the pollen; as also a description of the structure of the pollen-grain, the confirmation of Amici's (1823) discovery of the pollen-tube, the confirmation of R. Brown's views as to the structure of the unimpregnated ovule (with the introduction of the term "sac embryonnaire"); and in that it shows how nearly Brongniart anticipated Amici's subsequent (1846) discovery of the entrance of the pollen-tube into the micropyle, fertilizing the female cell which then develops into the embryo. Of his anatomical works, those of the greatest value are probably the "Recherches sur la structure et les fonctions des feuilles" (*Ann. Sci. Nat.* xxi., 1830), and the "Nouvelles Recherches sur l'Épiderme" (*Ann. Sci. Nat.* i., 1834), in which, among other important observations, the discovery of the cuticle is recorded; and, further, the "Recherches sur l'organisation des tiges des Cycadées" (*Ann. Sci. Nat.* xvi., 1829), giving the results of the first investigation of the anatomy of those plants. His systematic work is represented by a large number of papers and monographs, many of which relate to the flora of New Caledonia; and by his *Énumération des genres de plantes cultivées au Muséum d'Histoire Naturelle de Paris*, 1843, which is an interesting landmark in the history of classification in that it forms the starting-point of the system, modified successively by A. Braun, Eichler, and Engler, which is now adopted in Germany. In addition to his scientific and professorial labours, Brongniart was actively engaged in other directions. He held various important official posts in connexion with the Department of Education, and interested himself greatly in agricultural and horticultural matters. With Audouin the geologist and Dumas the chemist, his future brothers-in-law, he established the *Annales des Sciences Naturelles* in 1824; he also founded the Société Botanique de France in 1854, and was its first president.

Accounts of his life and work have been given by M. de Saporta (*Bull. de la Soc. Géol. de France*, 1876), and by M. Poisson (*La Nature*, 1876); the *Bulletin de la Soc. Bot. de France* for 1876 (vol. xxiii.) contains a list of his works and the orations pronounced at his funeral.

(S. H. V.*)

Bronx, The, the northernmost of the five boroughs of New York city (*q.v.*)

Bronze.—Bronze alloys have in recent years come to be largely used in mechanical engineering. The principal bronzes are phosphor bronze, aluminium bronze, delta metal, and manganese bronze.

Phosphor bronze, in the ingot, has the composition—copper, 87·8 parts; tin, 11·17; phosphorus, 1·03, although this proportion may vary somewhat. After casting from the ingot, the phosphorus may be reduced to the merest trace, but its presence while melting is useful. If overheated in casting, phosphor bronze loses many of its valuable properties. Phosphor bronze is used for pump plungers, valves, bushes of bearings, &c., and generally for purposes where a hard, strong metal is needed. It is less well suited than other bronzes for bearing heavy vibratory loads. The tensile strength of phosphor bronze in the ingot ranges from 22 to 25 tons per square inch, with an elongation of from 4 to 8 per cent. in 2 inches' length. This strength is usually reduced in the casting to about 16 tons, and may be increased by the process of rolling to from 25 to 40 tons, with from 8 to 20 per cent. elongation in 2 inches.

Aluminium bronze has a considerable tendency in casting to draw in the mould. It possesses a tensile strength of about 25 tons per square inch, with 17 per cent. elongation in 2 inches in the casting, and this may be further increased by rolling to 40 tons with 15 per cent. elongation. This alloy will take a very high polish, and it is claimed for it that it does not readily corrode. It is difficult, if not impossible, to solder satisfactorily together articles made of aluminium bronze.

Bronzes termed *Delta metal* are variously composed to suit the particular purpose for which the alloy will be used, and give generally excellent results. Some of these bronzes possess high tensile strength and ductility. They resist corrosion from seawater to a remarkable extent, and are well suited for manufacture of pump plungers, pistons, glands, and for screw propellers. Propellers of this material have in actual use withstood a remarkable amount of deformation without fracture, while, on account of its malleability, a limited amount of bending of the propeller blade, resulting from accident, may be corrected by heating and setting. Delta metal heated to a dull red becomes malleable, and can be worked under the hammer, press, or stamps, the strength being very much increased by the process. When so treated an ultimate tensile strength of 30 tons per square inch has been obtained, with the remarkable elongation of 32 per cent. in 2 inches and a contraction of area of 30 per cent. Mr. Alex. Dick, of the Delta Metal Company, has made the discovery that copper and its alloys can be separated while in a heated and plastic condition, and, provided no air is allowed to come into contact with the surfaces to produce oxidation, they will reunite under pressure, becoming perfectly welded together. This has led to the laying down of plant for the manufacture of bronze tubes and pipes, and other sections, by the process of extension, the resulting products being of high quality and strength, and perfectly sound. The process of manufacture is carried on by means of a hydraulic press; the metal, which is at a high temperature, that of plasticity, about 1000 deg. Fah., is placed in a compressing cylinder or container, into which the hydraulic ram enters. The ram is provided with a dish steel cheek-disc at the forward end, which expands under the pressure and fits the bore of the cylinder. The die-plates are formed with openings representing the section required for the article to be produced, and in the case of tubes there is a mandril in the central opening in the die-plate, which is attached by ribs to the die. The plastic metal when flowing is divided by the ribs of the die, but becomes reunited and firmly welded together after passing the ribs. This action is dependent on the exclusion of the air. The process improves the quality of the metal, and some tests of delta metal bars made by extension show a tensile strength of 48 tons per square inch, with 32 per cent. elongation in 2 inches.

The limit of elasticity of the alloys of copper and zinc increases with the proportion of zinc. The amount of elongation before fracture also increases with the proportion of zinc, reaching a maximum at 30 per cent. of zinc, and then decreasing rapidly. The tenacity increases with the proportion of zinc, attains a maximum at 45 per cent. of zinc, and then decreases rapidly. The alloys become fragile when they contain 50 per cent. of zinc. By varying the proportion of zinc between 30 and 43 per cent. a series of alloys may be prepared presenting very varied properties. The most malleable of the series elongates about 60 per cent., with a tensile strength of 17·5 tons per square inch. Higher tensile strength may be obtained by increasing the proportion of zinc, but the percentage of elongation is reduced thereby and the tendency to produce unsound castings materially increased. The addition of a small quantity of iron improves the quality of copper zinc alloys.

Manganese bronze is a copper zinc alloy of high value, on

account of the possibility of obtaining a material in which the elastic limit more nearly approaches the ultimate strength than is usually the case with bronzes. The composition of manganese bronze in the ingot may be taken as:—Copper, 56·52 per cent.; tin, 35; lead, 35; iron, 1·5; zinc, 40·78, with a trace of manganese. The fracture when broken by tension has a fine silky appearance. In the ingot the material may possess a tensile strength of 32 tons per square inch, with 35 per cent. elongation in 2 inches, which is usually reduced by casting to about 29·5 tons per square inch, with 20 per cent. elongation. By rolling, the tensile strength is increased to 35 to 40 tons per square inch, with from 10 to 35 per cent. elongation in 2 inches. In casting there is considerable tendency to volatilize the zinc from overheating, rendering it somewhat difficult to secure sound castings with high tensional strength; there is also a large amount of shrinkage in the mould when cooling, which is objectionable. Speaking generally, there is risk of unsoundness with high-tension bronze, rendering it somewhat untrustworthy for the purpose of retaining water or air under pressure; but a low-tension bronze, with a tenacity of about 12 tons per square inch, will give sound castings. Thus, a bronze composed of copper, 85·5 per cent.; tin, 12·0 per cent.; zinc, 2·5 per cent., gives satisfactory results. (G. H. BA.)

Brookfield, a city of Linn county, Mo., U.S.A., situated in the northern part of the state, on the Chicago, Burlington, and Quincy railway, at an altitude of 757 feet. Population (1880), 2264; (1890), 4547; (1900), 5484.

Brookings, capital of Brookings county, South Dakota, U.S.A., situated in the eastern part of the state, on the Chicago and North-Western railway, and on Big Sioux river, at an altitude of 1636 feet. It is the seat of the State Agricultural College. This institution, maintained at the joint expense of the state and the United States, had, in 1900, 29 instructors and 508 students. Population (1890), 1518; (1900), 2346.

Brookline, a town of Norfolk county, Massachusetts, U.S.A., adjoining Boston on the south-west. It is a residential suburb of Boston, containing several small villages, and is traversed by the Boston and Albany railway. Population (1880), 8057; (1890), 12,103; (1900), 19,935.

Brooklyn, formerly a city of New York State, U.S.A., but since 1st January 1898 a borough of the city of New York. It is situated at the west end of Long Island, in the south-eastern part of the state, and is separated from Manhattan borough, formerly New York city, by the East river. The borough of Brooklyn includes all of King's county, the township of New Lots having been annexed to the then city of Brooklyn in 1886, and Flatbush, Gravesend, New Utrecht, and Flatlands in 1894. These additions gave the city an area of 65·77 square miles, extending from the East river across the island to the south coast, and including the summer resorts of Coney Island. It retains under its present organization as a borough, practically the same area as it had before as a city. The borough contains thirty-two wards. It is connected (1901) with Manhattan borough by numerous ferries and by the Brooklyn suspension bridge, opened in 1883, and will in the near future be connected by additional bridges. Means of transportation are ample; there are five lines of elevated railway, and there are trolley lines on many of the streets. The summer resorts on Coney Island on the south coast are connected with the city by trolley and steam railway lines. The borough contains thirty-two parks, ranging in size from a part of an acre to 516 acres, and with a total area of 1027 acres; the principal and best known of these is Prospect Park, a little west of the centre of the borough, containing 516 acres, and having the soldiers' and sailors' memorial arch at its entrance. There is also Brooklyn Forest Park situated in Queen's borough, containing 535 acres, and Fort Green Park in the heart of the city, besides which may be mentioned in this connexion the beautiful Greenwood Cemetery, of 474 acres, and a number

of broad, park-lined streets of differing length, the best known of which is the drive from Prospect Park to Coney Island. Brooklyn has long been known as the city of churches, probably from the famous clergymen who formerly lived there. In 1900 there were in the borough 466 churches, of which the Protestant numbered 364 with 129,413 members, and property valued at \$16,925,781. The Roman Catholic churches numbered 84, with 307,975 parishioners, and property valued at \$10,086,000. The borough contains a large number of hospitals and other eleemosynary institutions, and numerous libraries and educational institutions. Among its libraries are the Brooklyn Library, with (1901) 153,000 volumes; the Brooklyn Public Library, with 40,000; and the Long Island Historical Society Library with 66,000. Among its educational institutions is the Pratt Institute, largely for technical and industrial education, with 3000 students. This school has a fine library of 70,543 volumes. The Brooklyn Institute, founded in 1824, and reorganized in 1890 as the Brooklyn Institute of Arts and Sciences, has a fine building erected by the city, a membership (1900) of 6250, and gives lectures and laboratory practice in twenty-six departments of art and science. The public school system of Brooklyn consisted in 1901 of 1 training, 6 high, 121 elementary, and 1 truant schools; employed 3961 teachers and supervisors, and gave elementary and high school education to 154,542 scholars. In 1900 there were in the borough 354,612 persons of school age (5 to 20 years inclusive). Of a total street mileage of 722 miles, all but 162 miles were paved as follows:—granite blocks, 117 miles; Belgian blocks, 47 miles; asphalt, 82 miles; cobble stone, 227 miles; macadam, 82 miles; brick, 5 miles. Order is maintained by a force of 1838 police, including officers and privates. The provision against fire consists of 62 engines and 17 hook and ladder companies. The water-supply is in public hands; it is derived from streams flowing southwards in the sparsely settled area east of the borough, and also from driven wells in the same region; it is pumped at Ridgewood to a reservoir having a capacity of 375,000,000 gallons, while a small part is re-pumped to a high-service reservoir for the service of the most elevated part of the borough. Besides this system the towns recently annexed have their own water-supply. Within the limits of the borough are 597 miles of public distributing mains. The borough has seven markets, including the immense Wall-about market, which is situated on the water front and has a large wholesale trade.

Although in great part a residential suburb of her greater neighbour on the other side of the East river, Brooklyn has large manufacturing and commercial interests of her own. By the census of 1890 she had 10,583 industrial establishments employing capital to the amount of \$161,730,500. The number of employees was 109,292, and to them was paid \$65,247,119 in wages. Raw material to the value of \$151,060,710 was used, and the value of the products was \$269,244,147. These products were varied, no class greatly preponderating; the following list contains the principal items, with the value of the product:—bread and other bakery products, \$9,331,523; chemicals, \$9,091,609; clothing, \$13,941,636; cordage, \$6,535,792; foundry and machine-shop products, \$15,627,536; malt liquors, \$12,004,529; lumber, \$5,930,829; slaughtering and meat packing, \$13,087,354; sugar refining, \$16,629,982. Besides the above, oil refining and ship-building are important industries, and at the present time probably half the sugar supply of the country is refined here. As a commercial port Brooklyn is surpassed only by the borough of Manhattan and by Jersey city. It has 33 miles of water front, that portion bordering on the East river and New York harbour being lined with wharves, docks, warehouses, and elevators, constructed at a cost of hundreds of millions of dollars. Among its docks are the Atlantic Basin, containing 40 acres, and having seven elevators, and the Erie Basin, enclosing about 100 acres, and containing two dry docks, respectively 510 and 610 feet long, besides three floating dry docks. Brooklyn is the principal port in the U.S. for the export of grain, four-fifths of that exported

from the port of New York being shipped here. Its elevators have a capacity of 20,000,000 bushels. Steamships of more than twenty regular lines land here, besides many "tramps" and sailing vessels. The U.S. Navy Yard, located here, is the largest in the country, and contains three dry docks, respectively 338, 440, and 627 feet in length on the floor. The borough contains also a U.S. Naval Hospital. Most of the financial operations are carried on upon the opposite side of the East river, yet the borough contains 5 national banks, 16 state banks, 16 savings banks, and 10 trust companies. The assessed valuation of real estate in 1901 was \$658,962,119, and of personal property, \$89,241,624, a total of \$748,203,743. The tax rate for municipal purposes (*i.e.* expenses of New York city as a whole) was 2.03869 per cent.; for local county purposes (expenses of King's county), 0.14908 per cent. additional. The number of marriages in 1900 was 8087, of births 23,078, and of deaths 23,473, showing a death-rate of 20 per thousand. The population of what is now Brooklyn, then King's county, was in 1880, 599,495; in 1890, 838,547; and in 1900, 1,166,582. The towns added to it in 1894 had in 1890 a population as follows:—Flatbush, 12,338; Flatlands, 4075; Gravesend, 6937; New Utrecht, 8854. Of the total population in 1900, 355,697 were foreign-born and 19,673 were coloured, of whom 18,367 were negroes. Of the white population, 1,146,909, comprising 98.3 per cent. of the total population, 353,750 were foreign-born, 482,658 were native-born but of foreign parents, leaving only 310,501, or 27 per cent., native-born of native parents. Out of 332,715 males of voting age (21 years and over), 15,415 were illiterate (unable to write), of whom 14,159 were foreign-born. The death-rate, which in 1890 was 24, had fallen to 19.9 in 1900. (See also NEW YORK CITY.)

Brooks, Phillips (1835-1893), American clergyman and author, was born in Boston, Mass., 13th December 1835. He was son of William Gray and Mary Ann (Phillips) Brooks. Through his father he was descended from the Rev. John Cotton; through his mother, a woman of rare force of character and religious faith, he was a great-grandson of the founder of Phillips Academy, Andover, Mass. Of the six sons, four—Phillips, Frederic, Arthur, and John Cotton—entered the ministry of the Protestant Episcopal Church. He was educated in the Boston Latin School and Harvard College, graduating in 1855. After a short and unsuccessful experience as a teacher in the Boston Latin School, he began in 1856 to study for the ministry of the Protestant Episcopal Church in the Seminary at Alexandria, Virginia. In 1859 he was ordained deacon by Bishop Meade of Virginia, and became rector of the Church of the Advent, Philadelphia. In 1860 he was ordained priest, and in 1862 became rector of the Church of the Holy Trinity, Philadelphia, where he remained seven years, gaining an increasing name as preacher and patriot. Endowed by inheritance with a rich religious character, evangelical traditions, ethical temper, and strong intellect, he developed, by wide reading in ancient and modern literature, a personality and an attitude of mind which appealed to the characteristic thought and life of the period. With Tennyson, Coleridge, Maurice, and F. D. Robertson he was in strong sympathy. During the Civil War he upheld with power the cause of the North and the negro, and his sermon on the death of President Lincoln was an eloquent expression of the character of both men. In 1869 he became rector of Trinity Church, Boston. In 1877 the present church was built, the architect being his friend H. H. Richardson. Here Phillips Brooks preached Sunday after Sunday to great congregations, until he was consecrated bishop of Massachusetts in 1891. In 1886 he declined an election as assistant bishop of Pennsylvania. He was for many years an overseer and preacher of Harvard University. In 1881 he declined an invitation to be the sole preacher to the University and professor of Christian Ethics. His influence upon the religious life of the University was deep and wide. In the hearts of the people of his own city and commonwealth, and as years passed, of the whole country, he held a position of unique influence. His character was pure, simple, and great. Just, endowed

"Work" (A Street Scene in Hampstead). By Ford Madox Brown.
(By permission of the Corporation of Manchester.)

with excellent judgment and a keen sense of humour, he was at the same time quick to respond to any call for sympathy. In physique he was tall and well proportioned, his height being six feet four inches, his weight over 21 stones. When kindled by his subject it seemed to take possession of him and pour itself out with overwhelming speed of utterance, with heat and power. His sympathy with men of other ways of thought and with the truth in other ecclesiastical systems gained for him the confidence and affection of men of varied habits of mind and religious traditions, and was thus a great factor in gaining for the Episcopal Church the devotion of many people and in extending its influence throughout the nation. On 20th April 1891 he was elected sixth bishop of Massachusetts, and on 14th October was consecrated to that office in Trinity Church, Boston. After a brief but great episcopate of fifteen months, he died, unmarried, on 23rd January 1893. The degree of Doctor of Divinity had been conferred upon him by the universities of Harvard, U.S.A., and of Cambridge, England. In 1877 he published a course of lectures upon preaching, which he delivered at the Theological School of Yale University, and which are an expression of his own experience. In 1879 appeared the Böhlen Lectures on "The Influence of Jesus." In 1878 he published his first volume of sermons, and from time to time issued other volumes, including *Sermons Preached in English Churches* in the summer of 1882.

In 1901 was published, in two volumes, *Phillips Brooks, Life and Letters*, by the Rev. A. V. G. ALLEN, D.D., Professor of Ecclesiastical History, Episcopal Theological School, Cambridge, Mass. (W. L.)

Broughty Ferry, a police burgh and watering-place of Forfarshire, Scotland, on the north shore of the Firth of Tay, 3½ miles E. of Dundee by rail. The Castle of Broughty (Burgh Tay, 1498) is mounted with some heavy guns and garrisoned by a few artillerymen. There is a small fishing industry. There are a Dundee Convalescent Home, three public parks, and also several high-class private schools. Population (1881), 7407; (1901), 10,482.

Brown, Ford Madox (1821-1893), English painter, was born at Calais on 16th April 1821. His father was Ford Brown, a retired purser in the navy; his mother, Caroline Madox, of an old Kentish family. His paternal grandfather had been Dr John Brown, a Scotsman of humble origin, who established the so-called Brunonian Theory of Medicine, introducing principles and practice which are now allowed to be in great measure reforms. Ford Madox Brown was the only child of his parents, save for a daughter who died young. In childhood he was shifted about a good deal between France and England; and having shown from the age of six or seven a turn for drawing, he was taken, when aged fourteen and with meagre acquirements in the way of general tuition, to Bruges, and placed under the instruction of Gregorius, a pupil of the celebrated David. His principal instructor however, from about 1837, was Baron Wappers, of Antwerp, then regarded as a great light of the Belgian school. From him the youth learned the technique not only of oil painting but of various other branches of art. At a very early age Brown attained a remarkable degree of force in drawing and painting, as attested by an extant oil-portrait of his father, done at an age not exceeding fifteen. His first composition, towards 1836, represented a blind beggar and his child; his first exhibited work, 1837, was "Job on the Ash-heap"; the first exhibited work in London (at the Royal Academy, 1840), "The Giaour's Confession," from Byron's poem.

Both his parents died before 1840, leaving to the young painter a moderate competence, which soon was materially reduced. In 1840 Brown completed a large picture, "The Execution of Mary Queen of Scots," strong in dramatic effect and in handling, with rather sombre colour; from this time forth he must be regarded as a proficient artist, independent in his point of view, and strenuous in execution. He contributed to the cartoon competitions, 1844 and 1845, for the Houses of Parliament—"Adam and Eve after the Fall," "The Body of Harold brought to William the Conqueror," and "The Spirit of Justice." These highly remarkable cartoons passed not wholly unobserved, but not one of them obtained a prize. The years 1840 to 1845 were passed in Paris, London, and Rome: towards the middle of 1846 Brown settled permanently in London. In 1841 he married his cousin Elizabeth Bromley, who died of consumption in 1846, leaving a daughter, Lucy, who in 1874 became the wife of William M. Rossetti. Not long after being left a widower, Brown took a second wife, Emma Hill, who figures in many of his pictures. She had two children who grew up: Catherine, who married Dr Franz Hueffer, the musical scholar and critic, and Oliver, who died in 1874 in his twentieth year. All the three children showed considerable ability in painting, and Oliver in romance as well. The second Mrs Brown died in 1890.

The most marked distinction of Brown as an artist may be defined as vigorous invention of historic or dramatic scenes, carried out with a great regard to individuality in the personages, expressions, and accessories of incident and detail, not excluding the familiar, the peculiar, and the semi-grotesque, when these seem to subserve the general intent. Owing, however, to his association with artists of the so-called "pre-Raphaelite" movement (which began late in 1848), and especially with Dante Gabriel Rossetti, who received some training in his studio in the spring of that year, he has been regarded sometimes as the precursor or initiator of this movement, and sometimes as a direct co-operator in it. His claim to be regarded as a precursor or initiator is not strong; though it is true that even before 1841 he had pondered the theory (not then much in vogue) that a picture ought to present the veritable light and shade proper to some one moment in the day, and his "Manfred on the Jungfrau" (1841) exemplifies this principle to some extent; it re-appears in his very large picture of "Chaucer at the Court of Edward III." (now in the public gallery of Sydney, Australia), which, although projected in 1845, was not brought to completion until 1851. As to becoming a direct co-operator in the pre-Raphaelite movement, he did not join the "Brotherhood," though it would have been open to him to do so; but for some years his works exhibited a marked influence derived from the movement, not on the whole to their clear advantage. The principal pictures of this class are: "The Pretty Baa-lambs"; "Work" (a street scene at Hampstead, see Plate); and "The Last of England" (an emigration subject, one of his most excellent achievements): dating between 1851 and 1863. "Christ Washing Peter's Feet" (now in the National Gallery of British Art) comes within the same range of dates, and is a masterly work; here the pre-Raphaelite influence is less manifest. Altogether it may be averred that the conception and introduction of the pre-Raphaelite scheme, such as it appeared to the public eye in 1849 and 1850, belong to Millais, Holman Hunt, and Rossetti, rather than to Brown.

Other leading pictures by Brown are the following:—"Cordelia at the Bedside of Lear"; "Shakespeare"; "Jacob and Joseph's Coat"; "Elijah and the Widow's Son"; "Cordelia's Portion"; "The Entombment"; "Romeo and Juliet" (the parting on the balcony); "Don Juan and Haidee"; "Crom-

well on his Farm"; "Cromwell, Protector of the Vaudois":—covering the period from 1849 to 1877. "Sardanapalus and Myrrha," begun within the same period, was finished later. He produced, moreover, a great number of excellent cartoons for stained glass, being up to 1874 a member of the firm of decorative art, Morris, Marshall, Faulkner, and Co. He also executed, in colours or in crayons, various portraits, including his own. From 1878 he was almost engrossed by work which he undertook for the town hall of Manchester, and which entailed his living for some few years in that city—twelve large wall paintings, some of them done in a modified form of the Gambier-Parry process, and others in oils on canvas applied to the wall surface. They present a compendium of the history of Manchester and its district, from the building of the Roman camp at Mancunium to the experimental work of Dalton in elaborating the Atomic Theory. This is an extremely fine series, though with some diversity of individual merit in the paintings, and is certainly the chief representative, in the United Kingdom, of any such form of artistic effort—if we leave out of count the works (by various painters) in the Houses of Parliament.

Madox Brown was never a popular or highly-remunerated artist. Up to near middle age he went through trying straits in money matters; afterwards his circumstances improved, but he was not really well off at any time. In youth he followed the usual course as an exhibiting painter, but after some mortifications and heart-burnings he did little in this way after 1852. He held, however, in 1865, an exhibition of his own then numerous paintings and designs. He also delivered a few lectures on fine art from time to time. From 1868 he suffered from gout; and this led to an attack of apoplexy, from which he died (in St Edmund's Terrace, London) on 6th October 1893. He was a man of upright, independent, and honourable character, of warm affections, a steady and self-sacrificing friend; but he took offence rather readily, and viewed various persons and institutions with a degree of suspicion which may be pronounced excessive. He felt interest in many questions outside the range of his art, and, being a good and varied talker, had often something apposite and suggestive to say about them. On more than one occasion he exerted himself very zealously for the benefit of the working classes. In politics he was a consistent Democrat, and on religious questions an Agnostic.

The life of this artist has been well written by his grandson, Ford M. Hueffer, in a handsomely-illustrated volume named *Ford Madox Brown*, London, 1896. This volume contains some extracts from Brown's diary, extending in the whole from 1847 to 1865; and other lengthier extracts appear in two books edited by William M. Rossetti—*Ruskin, Rossetti, Pre-Raphaelitism*, 1899, and *Pre-Raphaelite Diaries and Letters*, 1899. See also the *Preferences in Art*, &c., by Harry Quilter, 1892. (W. M. R.)

Brown, Thomas Edward (1830-1897), English poet, scholar, and divine, was born on 5th May 1830, at Douglas, Isle of Man, where his father, the Rev. Robert Brown, held the living of St Matthew's—a homely church in a poor district. His mother came of Scottish parentage, though born in the island. Thomas, the sixth of ten children, was but two years old when the family removed to Kirk Braddan Vicarage, a short distance from Douglas, where his father (a scholar of no university, but so fastidious about composition that he would have some sentences of an English classic read to him before answering an invitation) took share with the parish schoolmaster in tutoring the clever boy until, at the age of fifteen, he was entered at King William's College. Here his abilities soon declared themselves, and hence he proceeded to Christ Church, Oxford, where his position (as a servitor) cost him much humiliation, which he remembered to the end of his

life. He won a double first, however, and was elected a fellow of Oriel in April 1854, Dean Gaisford having refused to promote him to a senior studentship of his own college, on the ground that no servitor had ever before attained to that honour. Although at that time an Oriel fellowship conferred a deserved distinction, Brown never took kindly to the life, but, after a few terms of private pupils, returned to the Isle of Man as vice-principal of his old school. He had been ordained deacon, but did not proceed to priest's orders for many years. In 1857 he married his cousin, Miss Stowell, daughter of Dr Stowell of Ramsey, and soon afterwards left the island once more to become headmaster of the Crypt School, Gloucester—a position which in no long time he found intolerable. From Gloucester he was summoned by the Rev. John Percival (afterwards Bishop of Hereford), who had recently been appointed to the struggling young foundation of Clifton College, which he soon raised to be one of the great public schools. Percival wanted a master for the modern side, and made an appointment to meet Brown at Oxford; "and there," he writes, "as chance would have it, I met him standing at the corner of St Mary's Entry, in a somewhat Johnsonian attitude, four-square, his hands deep in his pockets to keep himself still, and looking decidedly volcanic. We very soon came to terms, and I left him there under promise to come to Clifton as my colleague at the beginning of the following term." At Clifton Brown remained from September 1863 to July 1892, when he retired—to the great regret of boys and masters alike, who had long since come to regard "T. E. B.'s" genius, and even his eccentricities, with a peculiar pride—to spend the rest of his days upon the island he had worshipped from childhood and often celebrated in song. His poem, "Betsy Lee," appeared in *Macmillan's Magazine* (April and May 1873), and was published separately in the same year. It was included in *Fo'cs'le Yarns* (1881), which reached a second edition in 1889. This volume included at least three other notable poems—"Tommy Big-eyes," "Christmas Rose," and "Captain Tom and Captain Hugh." It was followed by *The Doctor and other Poems* (1887), *The Manx Witch and other Poems* (1889), and *Old John and other Poems* (a volume mainly lyrical) (1893). Since his death all these and a few additional lyrics and fragments have been published in one volume by Messrs Macmillan under the title of *The Collected Poems of T. E. Brown* (1900). His familiar letters (edited in two volumes by an old friend, Mr S. T. Irwin, in 1900) bear witness to the zest he carried back to his native country, although his thoughts often reverted to Clifton. In October 1897 he returned to the school on a visit. He was the guest of one of the house-masters, and on Friday evening, 29th October, he gave an address to the boys of the house. He had spoken for some minutes with his usual vivacity, when his voice grew thick and he was seen to stagger. He died in less than two hours. Brown's more important poems are narrative, and written in the Manx dialect, with a free use of pauses, and sometimes with daring irregularity of rhythm. A rugged tenderness is their most characteristic note; but the emotion, while almost equally explosive in mirth and in tears, remains an educated emotion, disciplined by a scholar's sense of language. They breathe the fervour of an island patriotism (humorously aware of its limits) and of a simple natural piety. In his lyrics he is happiest when yoking one or the other of these emotions to serve a philosophy of life, often audacious, but always genial. (A. T. Q.-C.)

Browne, Hablôt Knight, (1815-1882), English artist, famous chiefly as "Phiz," the illustrator of the best-known books by Charles Dickens, Charles

Lever, and Harrison Ainsworth in their original editions. His talents in other directions of art were of a very ordinary kind. As an interpreter and illustrator of Dickens's characters, "Phiz," as he nearly always signed his drawings, was in some respects the equal of his rivals Cruikshank and Leech, while, in his own way, he excelled them both. Browne was of Huguenot extraction and was born in Lambeth on 11th June 1815. His father dying early, left the family badly off. From the first, Browne showed a disposition towards art, and, after a moderate education, was apprenticed to Finden, the eminent engraver on steel, in whose studio Browne obtained his only artistic education. To engraving, however, he was entirely unsuited, and having in 1833 secured an important prize from the Society of Arts for a drawing of "John Gilpin," he abandoned engraving in the following year and took to other artistic work, with the ultimate object of becoming a painter. In the spring of 1836 the great event in the life of the artist took place, when he met Charles Dickens. It was at the moment when the serial publication of *Pickwick* was in danger from the want of a capable interpreter for the illustrations. Dickens knew Browne slightly as the illustrator of his little pamphlet *Sunday under Three Heads*, and probably this slight knowledge of his work stood the draughtsman in good stead. In the original edition of *Pickwick*, issued in shilling monthly parts from early in 1836 until the end of 1837, the first seven plates were drawn by Robert Seymour, a clever illustrator who committed suicide in April 1836. The next two plates were by R. W. Buss, an otherwise successful portrait-painter and lecturer, but they were so poor that a change was imperative. So thought the publishers, and so also did both H. K. Browne and W. M. Thackeray, who called independently at the publishers' office with specimens of their powers for Dickens's inspection. The novelist preferred Browne. Browne's first two etched plates for *Pickwick* were signed "Nemo," but the third was signed "Phiz," a pseudonym which was retained in future. When asked to explain why he chose this name he answered that the change from "Nemo" to "Phiz" was made "to harmonize better with Dickens's Boz." Possibly Browne adopted it to conceal his identity, hoping one day to become famous as a painter. It is to be noted, however, that "Phiz" is usually attached to his better work and H. K. B. to his less successful drawings. "Phiz" undoubtedly created Sam Weller, so far as his well-known figure is concerned, as Seymour had created Pickwick. Dickens and "Phiz" were personally good friends in early days, and in 1838 travelled together to Yorkshire to see the schools of which Nicholas Nickleby became the hero; afterwards they made several journeys of this nature in company to facilitate the illustrator's work. The other Dickens characters which "Phiz" realized most successfully are perhaps Squeers, Micawber, Guppy, Major Bagstock, Mrs Gamp, Tom Pinch, and, above all, David Copperfield. Of the books by Dickens which "Phiz" illustrated the best are *David Copperfield*, *Pickwick*, *Dombey and Son*, *Martin Chuzzlewit*, and *Bleak House*. Browne made several drawings for *Punch* in early days and also towards the end of his life; his chief work in this direction being the clever design for the wrapper which was used for eighteen months from January 1842. He also contributed to *Punch's Pocket Books*. In addition to his work for Dickens, "Phiz" illustrated over twenty of Lever's novels (the most successful being *Harry Lorrequer*, *Charles O'Malley*, *Jack Hinton*, and the *Knight of Gwynne*). He also illustrated Harrison Ainsworth's and Frank Smedley's novels. *Mervyn Clitheroe* by Ainsworth is one of the most admirable of the artist's works. Browne was in continual employment by publishers until 1867, when a shock of paralysis ruined his artistic career. Although he

recovered slightly and made many illustrations on wood, they were by comparison inferior productions, which the draughtsman's admirers would willingly ignore. In 1878 his affairs became so straitened that he was awarded an annuity by the Royal Academy. He gradually became worse in health until he died, 8th July 1882, at the age of sixty-seven. He was buried at Brighton. Browne was a facile draughtsman who readily grasped the intention of the writer he was illustrating. Occasionally he made an error, but it was usually because his pencil went on to delineate what the author may have intended but had not described. His illustrations are full of rollicking good-humour, and having a tendency to caricature they suit Dickens's and Lever's works admirably.

Most of Browne's work was etched on steel plates because these yielded a far larger edition than copper. Browne was annoyed at some of his etchings being transferred to stone by the publishers and printed as lithographic reproductions. Partly with the view to prevent this treatment of his work he employed a machine to rule a series of lines over the plate in order to obtain what appeared to be a tint; when manipulated with acid this tint gave an effect somewhat resembling mezzotint, which at that time it was found practically impossible to transfer to stone. The illustrations executed by Browne are particularly noteworthy because they realized exactly what the reader most desired to see represented. So skilful was he in drawing and composition that no part of the story was avoided by reason of the elaborateness of the subject. Whatever was the best incident for illustration was always the one selected.

Brownhills, a village of Staffordshire, England, in the Lichfield division of the county, 6 miles W. of the town of Lichfield, with stations on the North-Western and Midland railways, and near the Essington canal. Since 1894 it has been governed by an urban district council. There are extensive coal-mines in the district. The population of the urban district in 1891 was 11,820; in 1901, 15,252.

Browning, Robert (1812-1889), the great English poet, born at Camberwell, London, on 7th May 1812, was the son of Robert Browning, who for fifty years was employed in the Bank of England. Earlier Brownings had been settled in Wiltshire and Dorsetshire, and there is no ground for the statement that the family was partly of Jewish origin. The poet's mother was a daughter of William Weidemann, a German who had settled in Dundee and married a Scottish wife. His parents had one other child, a daughter, Sarianna, born in 1814. They lived quietly in Camberwell. The elder Browning had a sufficient income and was indifferent to money-making. He had strong literary and artistic tastes. He was an ardent book collector, and so good a draughtsman that paternal authority alone prevented him from adopting an artistic career. He had, like his son, a singular faculty for versifying, and helped the boy's early lessons by twisting the Latin grammar into grotesque rhymes. He lived, as his father had done, to be 84, with unbroken health. The younger Robert inherited, along with other characteristics, much of his father's vigour of constitution. From the mother, who had delicate health, he probably derived his excessive nervous irritability; and from her, too, came his passion for music. The family was united by the strongest mutual affection, and the parents erred, if anything, on the side of indulgence. Browning was sent to a school in the neighbourhood, but left it when fourteen, and had little other teaching. He had a French tutor for the next two years, and in his eighteenth year he attended some Greek lectures at the London University. At school he never won a prize,

though it was more difficult to avoid than to win prizes. He was more conspicuous for the love of birds and beasts, which he always retained, than for any interest in his lessons. He rather despised his companions and made few friends. A precocious poetical capacity, however, showed itself in extra-scholastic ways. He made his schoolfellows act plays, partly written by himself. He had composed verses before he could write, and when twelve years old completed a volume of poems called *Incondita*. His parents tried unsuccessfully to find a publisher; but his verses were admired by Sarah Flower Adams, a well-known hymn-writer of the day, and by W. J. Fox, both of whom became valuable friends. A copy made by Miss Flower was in existence in 1871, but afterwards destroyed by the author. Browning had the run of his father's library, and acquired a very unusual amount of miscellaneous reading. Quarles' *Emblems* was an especial favourite; and besides the Elizabethan dramatists and standard English books, he had read all the works of Voltaire. Byron was his first master in poetry, but about the age of fourteen he fell in accidentally with Shelley and Keats. For Shelley in particular he conceived an enthusiastic admiration which lasted for many years, though it was qualified in his later life.

The more aggressive side of Browning's character was as yet the most prominent; and a self-willed lad, conscious of a growing ability, found himself cramped in Camberwell circles. He rejected the ordinary careers. He declined the offer of a clerkship in the Bank of England; and his father, who had found the occupation uncongenial, not only approved the refusal but cordially accepted the son's decision to take poetry for his profession. For good or evil, Browning had been left very much to his own guidance, and if his intellectual training suffered in some directions, the liberty permitted the development of his marked originality. The parental yoke, however, was too light to provoke rebellion. Browning's mental growth led to no violent breach with the creeds of his childhood. His parents became Dissenters in middle life, but often attended Anglican services; and Browning, though he abandoned the dogmas, continued to sympathize with the spirit of their creed. He never took a keen interest in the politics of the day, but cordially accepted the general position of contemporary Liberalism. His worship of Shelley did not mean an acceptance of his master's hostile attitude towards Christianity, still less did he revolt against the moral discipline under which he had been educated. He frequented literary and artistic circles, and was passionately fond of the theatre; but he was entirely free from a coarse Bohemianism, and never went to bed, we are told, without kissing his mother. He lived with his parents until his marriage. His mother lived till 1849, and his father till 1866, and his affectionate relations to both remained unaltered. Browning's

first published poem, *Pauline*, appeared anonymously in 1833. He always regarded it as crude, and only consented with reluctance to republishing it in the collected works of 1868. The indication of genius was recognized by W. J. Fox, who hailed it in the *Monthly Repository* as marking the advent of a true poet. *Pauline* contains an enthusiastic invocation of Shelley, whose influence upon its style and conception is strongly marked. It is the only one of his works which can be regarded as imitative; and Browning's personality was fully revealed in his next considerable poems, *Paracelsus* (1835) and *Sordello* (1840). The three, however, form a group. In an essay (prefixed to the spurious Shelley letters of 1851), Browning describes Shelley's poetry "as a sublime fragmentary essay

towards a presentment of the correspondency of the universe to Deity." The phrase describes his own view of the true functions of a poet, and Browning, having accepted the vocation, was meditating the qualifications which should fit him for his task. The hero of *Pauline* is in a morbid state of mind which endangers his fidelity to his duty. *Paracelsus* and *Sordello* are studies in the psychology of genius, illustrating its besetting temptations. *Paracelsus* fails from intellectual pride, not balanced by love of his kind, and from excessive ambition, which leads him to seek success by unworthy means. *Sordello* is a poet distracted between the demands of a dreamy imagination and the desire to utter the thoughts of mankind. He finally gives up poetry for practical politics, and gets into perplexities only to be solved by his death. *Pauline* might in some indefinite degree

ROBERT BROWNING.

reflect Browning's own feelings, but in the later poems he adopts his characteristic method of speaking in a quasi-dramatic mood. They are, as he gave notice, "poems, not dramas." The interest is not in the external events, but in the "development of a soul"; but they are observations of other men's souls, not direct revelations of his own. *Paracelsus* was based upon a study of the original narrative, and *Sordello* was a historical, though a very indefinite person. The background of history is intentionally vague in both cases. There is one remarkable difference between them. The *Paracelsus*, though full of noble passages, is certainly diffuse. Browning heard that John Sterling had complained of its "verbosity," and tried to remedy this failing by the surgical expedient of cutting out the usual connecting words. Relative pronouns henceforth become scarce in his poetry, and the grammatical construction often a matter of conjecture. Words are forcibly jammed together instead of being articulately combined. To the ordinary reader many passages in his later work are both crabbed and obscure, but the "obscurity" never afterwards reached the pitch of *Sordello*. It is due to the vagueness with which the story is rather hinted than told, as well as to the subtlety and intricacy of the psychological

expositions. The subtlety and vigour of the thought are indeed surprising, and may justify the frequent comparisons to Shakespeare; and it abounds in descriptive passages of genuine poetry.

Still, Browning seems to have been misled by a fallacy. It was quite legitimate to subordinate the external incidents to the psychological development in which he was really interested, but to secure the subordination by making the incidents barely intelligible was not a logical consequence. We should not understand Hamlet's psychological peculiarities the better if we had to infer his family troubles from indirect hints. Browning gave more time to *Sordello* than to any other work, and perhaps had become so familiar with the story which he professed to tell that he failed to make allowance for his readers' difficulties. In any case it was not surprising that the ordinary reader should be puzzled and repelled, and the general recognition of his genius long delayed, by his reputation for obscurity. It might, however, be expected that he would make a more successful appeal to the public by purely dramatic work, in which he would have to limit his psychological speculation and to place his characters in plain situations. *Paracelsus* and *Sordello* show so great a power of reading character and appreciating subtler springs of conduct that its author clearly had one, at least, of the most essential qualifications of a dramatist.

Before *Sordello* appeared Browning had tried his hand in this direction. He was encouraged by outward circumstances as well as by his natural bent. He was making friends and gaining some real appreciative admirers. John Forster had been greatly impressed by *Paracelsus*. Browning's love of the theatre had led to an introduction to Macready in the winter of 1835-36; and Macready, who had been also impressed by *Paracelsus*, asked him for a play. Browning consented and wrote *Strafford*, which was produced at Covent Garden on 11th May 1837, Macready taking the principal part. Later dramas were *King Victor and King Charles*, published in 1842, *The Return of the Druses* and *A Blot on the 'Scutcheon* (both in 1843), *Colombe's Birthday* (1844), *Luria* and *A Soul's Tragedy* (both in 1846), and the fragmentary *In a Balcony* (1853). *Strafford* succeeded fairly, though the defection of one of the actors stopped its run after the fifth performance. The *Blot on the 'Scutcheon*, produced by Macready as manager of Drury Lane on 11th February 1843, led to an unfortunate quarrel. Browning thought that Macready had felt unworthy jealousy of another actor, and had gratified his spite by an inadequate presentation of the play. He remonstrated indignantly and the friendship was broken off for years. Browning was disgusted by his experience of the annoyances of practical play-writing, though he was not altogether discouraged. The play had apparently such a moderate success as was possible under the conditions, and a similar modest result was attained by *Colombe's Birthday*, produced at Covent Garden on 25th April 1853. Browning, like other eminent writers of the day, failed to achieve the feat of attracting the British public by dramas of high literary aims, and soon gave up the attempt. It has been said by competent critics that some of the plays could be fitted for the stage by judicious adaptation. The *Blot on the 'Scutcheon* has a very clear and forcibly treated situation; and all the plays abound in passages of high poetic power. Like the poems, they deal with situations involving a moral probation of the characters and often suggesting the ethical problems which always interested him. The speeches tend to become elaborate analyses of motive by the persons concerned, and would try the patience of an average audience, though interesting to an intelligent reader in the closet. For whatever reason,

Browning, though he had given sufficient proofs of genius, had not found in these works the most appropriate mode of utterance.

The dramas, after *Strafford*, formed the greatest part of a series of pamphlets called *Bells and Pomegranates*, eight of which were issued from 1841 to 1846. The name, he explained, was intended to indicate an "alternation of poetry and thought." The first number contained the fanciful and characteristic *Pippa Passes*. The seventh, significantly named *Dramatic Romances and Lyrics*, contained some of his most striking shorter poems. In 1844 he contributed some similar poems to *Hood's Magazine* in order to help Hood, then in his last illness. These poems take the special form in which Browning is unrivalled. He wrote very few lyrical poems of the ordinary kind purporting to give a direct expression of his own personal emotions. But, in the lyric which gives the essential sentiment of some impressive dramatic situation, he has rarely been approached. There is scarcely one of the poems published at this time which can be read without fixing itself at once in the memory as a forcible and pungent presentation of a characteristic mood. Their vigour and originality failed to overcome at once the presumption against the author of *Sordello*. Yet Browning was already known to and appreciated by such literary celebrities of the day as Talfourd, Leigh Hunt, Procter, Monckton Milnes, Carlyle, and Landor. His fame began to spread among sympathetic readers. The *Bells and Pomegranates* attracted the rising school of "pre-Raphaelites," especially D. G. Rossetti, who guessed the authorship of the anonymous *Pauline* and made a transcript from the copy in the British Museum. But his audience was still select.

Another recognition of his genius was of incomparably more personal importance and vitally affected his history. In 1844, Miss Barrett published a volume of poems containing "Lady Geraldine's Courtship," with a striking phrase about Browning's poems. He was naturally gratified, and her special friend and cousin, John Kenyon, encouraged him to write to her. She admitted him to a personal interview after a little diffidence, and a hearty appreciation of literary genius on both sides was speedily ripened into genuine and most devoted love. Miss Barrett was three years older than Browning and a confirmed invalid with shaken nerves. She was tenderly attached to an autocratic father who objected on principle to the marriage of his children. The correspondence of the lovers (published in 1899) shows not only their mutual devotion, but the chivalrous delicacy with which Browning behaved in a most trying situation. Miss Barrett was gradually encouraged to disobey the utterly unreasonable despotism. They made a clandestine marriage on 12th September 1846. The state of Miss Barrett's health suggested misgivings which made Browning's parents as well as his bride's disapprove of the match. She, however, appears to have become stronger for some time, though always fragile and incapable of much active exertion. She had already been recommended to pass a winter in Italy. Browning had made two previous tours there, and his impressions had been turned to account in *Sordello* and *Pippa Passes*. For the next fifteen years the Brownings lived mainly in Italy, making their headquarters at Florence. A couple of winters were passed in Rome. In the summer of 1849 they were at Siena, where Browning was helpful to Landor, then in his last domestic troubles. They also visited England and twice spent some months in Paris. Their only child, Robert Weidemann Browning, was born at Florence in 1849. Browning's literary activity during his marriage seems to have been comparatively small; though the two volumes called *Men and Women* (1855) contained

some of his best work and showed that his power was still growing. His position involved some sacrifice and imposed limitations upon his energies. Mrs Browning's health required a secluded life; and Browning, it is said, never dined out during his marriage, though he enjoyed society and made many and very warm friendships. The only breach of complete sympathy with his wife was due to his contempt for "spiritualists" and "mediums," in whom she fully believed. His portrait of the notorious Home as "Sludge" only appeared after her death. This domestic happiness, however, remained essentially unbroken until she died on 29th June 1861. The whole love-story had revealed the singular nobility of his character, and, though crushed for a time by the blow, he bore it manfully. Browning determined to return to England and superintend his boy's education at home. He took a house in Warwick Crescent, Bayswater, and became gradually acclimatized in London. He resumed his work and published the *Dramatis Personæ* in 1864. The publication was well enough received to mark the growing recognition of his genius, which was confirmed by *The Ring and the Book*, published in four volumes in the winter of 1868-69. In 1867 the University of Oxford gave him the degree of M.A. "by diploma," and Balliol College elected him as an honorary fellow. In 1868 he declined a virtual offer of the rectorship of St Andrews. He repeated the refusal on a later occasion (1884) from a dislike to the delivery of a public address. The rising generation was now beginning to buy his books; and he shared the homage of thoughtful readers with Tennyson, though in general popularity he could not approach his friendly rival. *The Ring and the Book* has been generally accepted as Browning's masterpiece. It is certainly most characteristic. The audacity of the scheme is surprising. To tell the story of a hideous murder twelve times over, to versify the arguments of counsel and the gossip of quidnuncs, and to insist upon every detail with the minuteness of a law report, could have occurred to no one else. The poem is so far at the opposite pole from *Sordello*. Vagueness of environment is replaced by a photographic distinctness, though the psychological interest is dominant in both. Particular phrases may be crabbed, but nothing can be more distinct and vivid in thought and conception. If some of those "dramatic monologues" of which the book is formed fail to be poetry at all, some of them—that of Pompilia the victim, her champion Caponsacchi, and the Pope who gives judgment—are in Browning's highest mood, and are as impressive from the ethical as from the poetical point of view. Pompilia was no doubt in some respects an idealized portrait of Mrs Browning. Other pieces may be accepted as a background of commonplace to throw the heroic into the stronger relief. *The Ring and the Book* is as powerful as its method is unique.

Browning became gentler and more urbane as he grew older. His growing fame made him welcome in all cultivated circles, and he accepted the homage of his admirers with dignity and simplicity. He exerted himself to be agreeable in private society, though his nervousness made him invariably decline ever to make public speeches. He was an admirable talker, and took pains to talk his best. A strong memory supplied him with abundant anecdotes; and though occasionally pugnacious, he allowed a fair share of the conversation to his companions. Superficial observers sometimes fancied that the poet was too much sunk in the man of the world; but the appearance was due to his characteristic reluctance to lay bare his deeper feelings. When due occasion offered, the underlying tenderness of his affections was abundantly manifest. No one could show more delicate sympathy. He made many warm personal friend-

ships in his later years, especially with women, to whom he could most easily confide his feelings. In the early years of this period he paid visits to country houses, but afterwards preferred to retire farther from the London atmosphere into secluded regions. He passed some holidays in remote French villages, Pornic, Croisic, and St Aubyn, which have left traces in his poetry. At St Aubyn he had the society of J. Milsand, a French writer who had shown his warm appreciation of Browning's poetry by an article in the *Revue des Deux Mondes*, which in 1852 had led to a personal friendship lasting till Milsand's death in 1886. Browning sent to him the proof-sheets of all his later works for revision. In 1877 Browning was at La Saisiaz on the Salève, near Geneva, where an old friend, Miss Egerton Smith, was staying. She died suddenly almost in his presence. She had constantly accompanied him to concerts during his London life. After her death he almost ceased to care for music. The shock of her loss produced the singular poem called *La Saisiaz*, in which he argues the problem of personal immortality with a rather indefinite conclusion. In later years Browning returned to Italy and passed several autumns at Venice. He never visited Florence after his wife's death there.

Browning's literary activity continued till almost the end of his life. He wrote constantly, though he composed more slowly. He considered twenty-five or thirty lines to be a good day's work. His later writings covered a very great variety of subjects, and were cast in many different forms. They show the old characteristics and often the old genius. Browning's marked peculiarity, the union of great speculative acuteness with intense poetical insight, involved difficulties which he did not always surmount. He does not seem to know whether he is writing poetry or when he is versifying logic; and when the speculative impulse gets the upper hand, his work suggests the doubt whether an imaginary dialogue in prose would not have been a more effective medium. He is analysing at length when he ought to be presenting a concrete type, while the necessities of verse complicate and obscure the reasoning. A curious example is the *Prince Hohenstiel-Schwangau* (1871), an *alias* for Louis Napoleon. This attempt to show how a questionable hero apologizes to himself recalls the very powerful "Bishop Blougram," and "Sludge, the medium," of earlier works, but becomes prolix and obscure. *Fifine at the Fair* (1872) is another curious speculation containing a defence of versatility in love-making by an imaginary Don Juan. Its occasionally cynical tone rather scandalized admirers, who scarcely made due allowance for its dramatic character. Browning's profound appreciation of high moral qualities is, however, always one main source of his power. In later years he became especially interested in stories of real life, which show character passing through some sharp ordeal. The *Red Cotton Nightcap Country* (1873), describing a strange tragedy which had recently taken place in France, and especially *The Inn Album* (1875), founded on an event in modern English society, are powerful applications of the methods already exemplified in *The Ring and the Book*. The *Dramatic Idyls* (1879 and 1880) are a collection of direct narratives, with less analytical disquisition, which surprised his readers by their sustained vigour. In the last volumes, *Jocoseria* (1883), *Ferishtah's Fancies* (1884), *Parleyings with Certain People* (1887), and *Asolando* (1889), the old power is still apparent, but the hand is beginning to fail. They contain discussions of metaphysical problems, such as the origin of evil, which are interesting as indications of his creed, but can scarcely be regarded as successful either poetically or philosophically.

Another group of poems showed Browning's interest in Greek literature. *Balaustion's Adventure* (1871) includes a "transcript from Euripides," a translation, that is, of part of the *Alcestis*. *Aristophanes' Apology* (1875) included another translation from the *Herakles*, and in 1877 he published a very literal translation of the *Agamemnon*. This, it seems, was meant to disprove the doctrine that Æschylus was a model of literary style. Browning shared his wife's admiration for Euripides, and takes a phrase from one of her poems as a motto for *Balaustion's Adventure*. In the *Aristophanes' Apology* this leads characteristically to a long exposition by Aristophanes of his unsatisfactory reasons for ridiculing Euripides. It recalls the apologies of "Blougram" and Louis Napoleon, and contains some interesting indications of his poetical theory. Browning was to many readers as much prophet as poet. His religious position is most explicitly, though still not very clearly, set forth in the *Christmas Eve and Easter Day* (1850). Like many eminent contemporaries, he combined a disbelief in orthodox dogma with a profound conviction of the importance to the religious instincts of the symbols incorporated in accepted creeds. *Saul* (1845), *A Death in the Desert* (1864), and similar poems, show his strong sympathy with the spirit of the old belief, though his argumentative works have a more or less sceptical turn. It was scarcely possible, if desirable, to be original on such topics. His admirers hold that he shows an affinity to German metaphysicians, though he had never read their works nor made any express study of metaphysical questions. His distinctive tendency is to be found rather in the doctrine of life and conduct which both suggests and is illustrated by his psychological analyses. A very characteristic thought emphatically set forth in the *Rabbi Ben Ezra* (1864) and the *Gramscian's Funeral* (1855) is that a man's value is to be measured, not by the work done, but by the character which has been moulded. He delights in exhibiting the high moral instinct which dares to override ordinary convictions, or which is content with discharge of obscure duties, or superior to vulgar ambition and capable of self-sacrifice, because founded upon pure love and sympathy for human suffering. Browning's limitations are characteristic of the poetry of strong ethical preoccupations. His strong idiosyncrasy, his sympathy with the heroic and hatred of the base, was hardly to be combined with the Shakespearian capacity for sympathizing with the most varied types of character. Though he deals with a great variety of motive with singularly keen analysis, he takes almost exclusively the moral point of view. That point of view, however, has its importance, and his morality is often embodied in poetry of surpassing force. Browning's love of the grotesque, sometimes even of the horrible, creates many most graphic and indelible portraits. The absence of an exquisite sense for the right word is compensated by the singular power of striking the most brilliant flashes out of obviously wrong words, and forcing comic rhymes to express the deepest and most serious thoughts. Though he professed to care little for motive as apart from human interest, his incidental touches of description are unsurpassably vivid.

The appreciation of Browning's genius became general in his later years, and zeal was perhaps a little heightened by the complacency of disciples able to penetrate a supposed mist of obscurity. The Browning Society, founded in 1881 by Mr Furnivall and Miss Hickey, was a product of this appreciation, and helped to extend the study of the poems. Browning accepted the homage in a simple and friendly way, though he avoided any action which would make him responsible for the publications. He received various honours; the LL.D. degree from Cam-

bridge in 1879, the D.C.L. from Oxford in 1882, and LL.D. from Edinburgh in 1884. He became foreign correspondent to the Royal Academy in 1886. His son, who had settled at Venice, married in 1887, and Browning moved to De Vere Gardens. In the autumn of 1889 he went with his sister to visit his son, and stayed on the way at Asolo, which he had first seen in 1838, when it supplied the scenery of *Pippa Passes*. He was charmed with the place, and proposed to buy a piece of ground and to build upon it a house to be called "Pippa's Tower"—in memory of his early heroine. While his proposal was under consideration he went to his son at Venice. His health had been breaking for some time, and a cold, aggravated by weakness of the heart, brought on a fatal attack. He died on 12th December 1889. He was buried in Westminster Abbey on 31st December. It was suggested that his wife's body should be removed from Florence to be placed beside him; but their son rightly decided that her grave should not be disturbed.

Browning's personal characteristics are so strongly stamped upon all his works that it is difficult to assign his place in contemporary thought. He is unique and outside of all schools. His style is so peculiar that he is the easiest of all poets to parody and the most dangerous to imitate. In spite of his early Shelley worship he is in certain respects more closely related to Wordsworth. Both of them started by accepting the poet's mission as quasi-prophetical or ethical. In other respects they are diametrically contrasted. Wordsworth expounded his philosophy by writing a poetical autobiography. Browning adheres to the dramatic method, of which Wordsworth was utterly incapable. He often protested against the supposition that he put himself into his books. Yet there is no writer whose books seem to readers to be clearer revelations of himself. Nothing, in fact, is more characteristic of a man than his judgments of other men, and Browning's are keen and unequivocal. The revolutionary impulse had died out, and Browning has little to say either of the political questions which had moved Shelley and Byron or of the social problems which have lately become more prominent. He represents the thought of a quieter epoch. He was little interested, too, in the historical or "romantic" aspect of life. He takes his subjects from a great variety of scenes and places—from ancient Greece, mediæval Italy, and modern France and England; but the interest for him is not in the picturesque surroundings, but in the human being who is to be found in all periods. Like Balzac, whom he always greatly admired, he is interested in the eternal tragedy and comedy of life. His problem is always to show what are the really noble elements which are eternally valuable in spite of failure to achieve tangible results. He gives, so far, another version of Wordsworth's doctrine of the cultivation of the "moral being." The psychological acuteness and the subtle analysis of character are, indeed, peculiar to himself. Like Carlyle, with whom he had certain points of affinity, he protests, though rather by implication than direct denunciation, against the utilitarian or materialistic view of life, and finds the divine element in the instincts which guide and animate every noble character. When he is really inspired by sympathy for such emotions he can make his most grotesque fancies and his most far-fetched analyses subservient to poetry of the highest order. It can hardly be denied that his intellectual ingenuity often tempts him to deviate from his true function, and that his observations are not to be excused because they result from an excess, instead of a deficiency, of intellectual acuteness. But the variety of his interests—æsthetic, philosophical, and ethical—is astonishing, and his successes

are poems which stand out as unique and unsurpassable in the literature of his time.

Browning's *Life*, by Mrs. Orr (1891), one of his most intimate friends in later years, and the correspondence with his wife before their marriage, published by his son in 1899, are the main authorities. A collection of Browning's poems in 2 vols. appeared in 1849, another in 3 vols. in 1863, another in 6 vols. in 1868, and a definite edition in 16 vols. in 1888-89. (L. S.)

Brown - Séquard, Charles Edward (1817-1894), the eminent physiologist, was born at Port Louis, Mauritius, on 8th April 1817. His father was an American and his mother a Frenchwoman, but he himself always desired to be looked upon as a British subject, though in the restlessness of his life and the enthusiasm of his disposition characteristics of his mother's nation were plainly visible. After graduating in medicine at Paris in 1840, he returned to Mauritius with the intention of practising there, but he soon went to America, subsequently returning to Paris. In 1859 he migrated to London, and became physician to the National Hospital for the Paralysed and Epileptic. There he stayed for about five years, expounding his views on the pathology of the nervous system in numerous lectures which attracted considerable attention. In 1864 he again crossed the Atlantic, and was appointed professor of Physiology and Nervous Diseases at Harvard. This position he relinquished five years later, to become professor at the Ecole de Médecine in Paris, but in 1873 he again returned to America, and began to practise in New York. Finally, he came back to Paris to succeed Claude Bernard in 1878 as professor of Experimental Medicine in the Collège de France, and he remained there till his death, which occurred on 2nd April 1894. Brown-Séquard was a bold investigator who did not shrink from trying daring experiments even on his own person, and in drawing inferences from his results he seemed to be gifted with a sort of prophetic instinct which enabled him to reach correct conclusions before they were warranted by actually ascertained facts. His researches, which are contained in about 500 essays and papers, some written in French and some in English, cover a wide range, but are especially concerned with the physiology and pathology of the nervous system. Towards the end of his life he gained a certain notoriety among people who would otherwise have taken no interest in his work, by his advocacy of the subcutaneous injection of orchitic substance for the treatment of nervous disorders. In this particular case the beneficial effects of the method are open to question, but in other applications, e.g., the administration of thyroid in myxœdema, good results have been obtained by the system of organotherapy, which is founded on the doctrines he held respecting the importance of the internal secretions of certain organs and their reabsorption into the circulation.

Brownson, Orestes Augustus (1803-1876), American theological, philosophical, and sociological writer, was born in Stockbridge, Vermont, 16th September 1803. Having spent some time in active religious, reformatory, and political (Democratic) work in the interior of New York State, Brownson removed to Chelsea, near Boston, Massachusetts, and at once made himself felt in the movements then agitating New England, which, between 1830 and 1850, was stirred by discussions pertaining to unitarianism, transcendentalism, spiritualism, abolitionism, and various schemes for communistic living. In several of these movements Brownson took an active but independent part, establishing the *Boston Quarterly Review*, mainly written by himself, in 1838. In his religious views he was successively a Presbyterian, a Universalist, and a Unitarian, finally becoming a Roman

Catholic in 1844, and so remaining, though the question of the orthodoxy of his writings was at one time submitted to a cardinal by the Pope. In his philosophy Brownson was a more or less independent follower of Comte for a time, and of Cousin, who praised him; he may be said to have taught a modified intuitionism. In his schemes for social reform he was at first a student of Robert Owen, until his later views led him to accept Roman Catholicism. His first quarterly was followed, in 1844, by *Brownson's Quarterly Review*, in which he expressed his opinions on many themes until its suspension in 1864, and after its revival for a brief period in 1873. Of his numerous publications in book form, the chief during his lifetime were *Charles Elwood, or The Infidel Converted* (1840, autobiographical), and *The American Republic: its Constitution, Tendencies, and Destiny* (1865), in which he based government on ethics, declaring the national existence to be a moral and even a theocratic entity, not depending for validity upon the sovereignty of the people. After his death his son, Henry F. Brownson, collected and published his various political, religious, philosophical, scientific and literary writings, in no less than twenty octavo volumes (Detroit, 1883-87), of which a condensed summary appeared in a single volume, also prepared by his son, entitled *Literary and Political Views* (New York, 1893). Brownson died in Detroit, Michigan, 17th April 1876.

Brownsville, capital of Cameron county, Texas, U.S.A., situated near the southern point of the state, on the Rio Grande, a few miles above its mouth, and opposite Matamoras in Mexico. It is on the Rio Grande railway, by which it is connected with Isabel on the coast. It has some river traffic, and a large trade with Mexico. Population (1880), 4938; (1890), 6134; (1900), 6305.

Broxburn, a mining and manufacturing town and railway station of Linlithgowshire, Scotland, on the Union Canal, 11½ miles W. of Edinburgh by road. It is the centre of the Scottish shale oil trade. There is a public hall, with reading-room. Population (1881), 3066; (1901) 6270.

Bruay, a town in the arrondissement of Béthune, department of Pas-de-Calais, France, on the Lawe, an affluent of the Lys, 16 miles in direct line N.W. of Arras, with station on the railway from Lens to St. Pol. It is situated in a rich coal-mining district. Population (1886), 5052; (1901), 7095.

Bruch, Max (1838—), German musical composer, son of a city official and grandson of the famous Evangelical cleric, Dr Christian Bruch, was born at Cologne, 6th January 1838. From his mother (*née* Almenræder), a well-known musician of her time, he learnt the elements of music, but under Breidenstein he made his first serious effort at composition at the age of fourteen by the production of a symphony. In 1853 Bruch gained the Mozart Stipendium of 400 gulden per annum for four years at Frankfort-on-Main, and for the following few years studied under Hiller, Reinecke, and Breunung. Subsequently he lived from 1858 to 1861 as pianoforte teacher at Cologne, in which city his first opera (in one act), *Scherz, List und Rache*, was produced in 1858. On his father's death, in 1861, Bruch began a tour of study at Berlin, Leipzig, Vienna, Munich, Dresden, and Mannheim, where his opera *Lorelei* was brought out in 1863. At Mannheim he lived till 1864, and there he wrote some of his best-known works, including the beautiful *Frithjof*. After a further period of travel he became musical-director at Coblenz (1865-67), Hofkapellmeister at Sondershausen (1867-70), and lived in Berlin (1871-73), where he wrote his *Odysseus*; his first violin

concerto and two symphonies being composed at Sondershausen. After five years at Bonn (1873-78), during which he made two visits to England, Bruch, in 1878, succeeded Stockhausen as conductor of the Stern Choral Union; in 1880 Benedict at the Liverpool Philharmonic; in 1892 von Herzogenberg at the Berlin Hochschule. In 1893 he was given the honorary degree of Mus. Doc. by Cambridge University. Max Bruch has written in almost every conceivable musical form, invariably with straightforward honest simplicity of design. He has a gift of refined melody beyond the common, his melodies being broad and suave and often exceptionally beautiful.

Bruchsal, a town of Germany, grand-duchy of Baden, 20 miles by rail S. of Heidelberg. It has a technical school, a prison constructed on the single-cell system, a gaol for female prisoners, and manufactures of machinery, paper, soap, beer, &c. Population (1885), 11,662; (1895), 12,614; (1900), 13,567.

Bruges (Flemish, *Brugge*), capital of the Belgian province of W. Flanders, 14 miles by rail E. of Ostend, at the junction of the Ghent, Ostend, and Sluys Canals. This delightful town is largely visited for the sake of its old buildings and its art treasures. Its ancient rampart is levelled and turned into a promenade, and its moat is in large part filled up. The manufacture of lace of various kinds employs about 12,000 women, from 4000 to 5000 of whom live in the city. There are also works for the construction of railway material and steam trawlers, brush factories, establishments for smoking herring and other fish, and many nurseries. The canal to Ostend offers an indifferent sea-road, because of its shallowness, sluices, and bridges. The new maritime way, intended to be completed in 1902, includes a port of call on the North Sea at Heyst, and a canal, 26 ft. deep, running in a straight line, 7 miles long, to Bruges, which will then be an inland port (see CANALS). The population, 47,961 in 1875, had fallen to 44,501 in 1880, but since then it has gradually increased to 55,641 in 1900.

See WEALE, *Bruges et ses environs*, 1865; *Stad Brugge, Verslag over het bestuur en den toestand van staats zaken*, 1897; *Compagnie des installations maritimes de Bruges: le port d'escale et le port intérieur de Bruges*, 1898; *Bulletin de la société royale belge de géographie*, 1898.—J. DU FIEF. *Bruges et le nouveau canal maritime*. (J. DU F.)

Brugsch, Heinrich Karl (1827-1894), German Egyptologist, was the son of a Prussian cavalry officer, and was born in the barracks at Berlin, 18th February 1827. He early manifested a great inclination to Egyptian studies, in which, though encouraged by Humboldt, he was almost entirely self-taught. After completing his university course and visiting foreign museums he was sent to Egypt by the Prussian Government in 1853, and contracted an intimate friendship with Mariette. On his return he received an appointment in the Berlin Museum. In 1860 he was sent to Persia on a special mission under Baron Minutoli, travelled over the country, and after Minutoli's death discharged the functions of ambassador. In 1864 he was consul at Cairo, in 1868 professor at Göttingen, and in 1870 director of the school of Egyptology, founded at Cairo by the Khedive. From this post he was unceremoniously dismissed in 1879 by the European controllers of the public revenues, determined to economize at all hazards; and French jealousy prevented his succeeding his friend Mariette at the Boulak Museum in 1883. He afterwards resided principally in Germany until his death on 9th September 1894, but frequently visited Egypt, took part in another official mission to Persia, and organized an Egyptian expedition in the United States. He had been made a pasha by the Khedive in 1881. He published his autobiography in 1894, concluding with a

warm panegyric upon British rule in Egypt. Brugsch's services to Egyptology are most important, including the standard ancient Egyptian History (1877), a geographical Dictionary of Ancient Egypt (1877-80); a hieroglyphic-demotic Dictionary (1877-82), and numerous works on the monuments. He also published accounts of his travels in Persia and northern Africa. (R. G.)

Brunei, a state situated in the north-west of Borneo. It has been so diminished in area since the beginning of the 19th century as to have become in comparison with the other states of Borneo territorially insignificant. It formerly included the whole of Northern Borneo, Southern Palawan, and stretched down the west coast as far as Sambas. What remains of this once powerful sultanate is a triangular-shaped territory, the base of the triangle being represented by eighty miles of coast-line, and the two sides by the frontiers of Sarawak. The area, as calculated by one method, is 1686 square miles; by another, 1701 square miles. In 1888 the state was placed under British protection. The country is ruled by a sultan, with absolute powers, whose usually good intentions are thwarted by ministers. The interior people have for centuries been subject to petty oppression, and there is too much of the old spirit left among the Malays to avoid acrimonious dispute and rebellion.

The bulk of its inhabitants, who consist of Malays, Kadayans, Orang Bukits, and a few Muruts, are to be found in and about the capital—also called Brunei—the population of the city being estimated at about 15,000, and the population of the whole territory being about 25,000. The city is prettily situated on the river, with cleared hills in the distance, and a background of heights clothed with magnificent forest. The dwelling-houses are built over the river, on slender piles obtained from the Nibong palm which resists the action of the water for several years. Though there are practically no exports and imports, there is a certain amount of inland commerce, the Brunei Malay usually earning a living as a trader with the interior tribes of Sarawak and British North Borneo. Some of them are skilled workers of brass, and the Brunei women make very beautiful cloth, interwoven and embroidered with gold thread. Sago is worked in Tutong and Balait, the two most important rivers in Brunei territory, but only a small quantity of rice is cultivated.

The history of this ancient and decaying sultanate is of great interest. Brunei or, as it is called by the natives, Bruni or Darul-Salam (city of peace), possesses a historic tablet of stone upon which, in A.H. 1221 (1804), was engraved in Malay characters the genealogy of the sovereigns who have ruled over the country. The engraving was the work of Datu Imaum Yakub, the high priest at the time, who received the genealogy from the lips of Merhoun Bongsu, otherwise the Sultan Muadin, and Sultan Kemal-Udin, who ordered this record of their forefathers to be written. This stone tablet now stands on the tomb of Sultan Mahommed Jemal-ul-Alam at the foot of Panggal hill, in the city of Brunei. The Selesilah, or Book of Descent, is kept in the palace by the present sultan. The other heirlooms which are also kept in the sultan's palace, and which descend to each sultan in turn, are the "Nobab Nagara" (two royal drums) from Johore and Menangkabau, and the "Gunta Alam" (bells), the gift of Sultan Bahkei of Johore or Malacca. The first sultan of Brunei was Alakber-Tata, who was probably of Bisaya stock, and who governed the country before the introduction of Islam, in the 15th century. He assumed the name of Mahommed on his conversion to Islam, which was brought about during a visit to the Malay peninsula. Brunei, at this time, was a dependency of Menjapahit (Java), and paid a yearly tribute of a jar of areca juice obtained from the young green nuts of the areca palm, and of no monetary value. The Hindu kingdom of Menjapahit was destroyed by the Mahommedans in 1478, and Brunei is mentioned in the history of Java as one of the countries conquered by Adaya Mingrat, the general of Angka Wijaya. Sultan Mahommed's only child was a daughter. His brother Akhmed married the daughter of Ong Chum Ping, a Chinese officer said to have been sent by his emperor to obtain a

jewel from mount Kina Balu in North Borneo, and was the successor of Sultan Mahommmed in the sovereignty of Brunei. He was succeeded by Sultan Berkat, an Arab Serif of high rank, from the country of Taif in Arabia, who had married Sultan Akhmed's only child. Sultan Berkat built a mosque and enforced Mahommedan law, and with the assistance of the Chinese built the stone wall, by sinking forty junks filled with rock across the mouth of the Brunei river, between the islands of Kaya Orang and Chermin, which is still in existence. This work was completed before the arrival of Pigafetta in 1521. In the reign of Sultan Bulkeiah Magellan's squadron anchored off the mouth of Brunei river in August 1521, and Pigafetta makes mention of the splendid court and the imperial magnificence of the Borneo capital. Sultan Bulkeiah was otherwise known as Nakoda Ragam, and was the great warrior of Brunei who voyaged to Java, Malacca, Luzon, and all round the coast of Borneo. His tomb, which is handsomely built of stone, is still to be seen in Brunei, and is constantly visited by Malays, who leave money and various articles on the tomb as offerings to his memory. Others, again, come and take away anything they can find, which they keep as charms and mementos. The Spaniards captured Brunei in 1580, the reigning sultan and his court retiring to Suai in the Baram district. The invaders were compelled to evacuate the place, however, in consequence of the heavy losses they sustained in the numerous attempts made for its recovery. The golden age of Brunei was nevertheless at an end, and there is little more of striking importance to record. Disputed successions and civil war, maladministration and the untrustworthiness of the Malay character, caused a steady decline in prosperity. The East India Company started a factory in the town in the 18th century, but commerce had already decayed and the establishment was abandoned. In the early part of the 19th century Brunei was but a resort for pirates and a market for the slave trade. During the 'forties Admiral (then Captain) Keppel and other officers of the British navy suppressed piracy in the neighbourhood. Sarawak was handed over to Raja Brooke, and, after the capture and temporary occupation of Brunei by Sir Thomas Cochrane, Labuan was ceded to the British empire. From this island it has always been possible to check the designs of the townspeople, and of late years a consul has been stationed there to watch affairs. Nowadays the political consequence of Brunei largely arises from the existence there of valuable seams of coal, leased to the Sarawak Government, which may in the future prove of great commercial importance.

Brunetière, Ferdinand (1849—), French critic and man of letters, was born at Toulon, 19th July 1849. After attending a school at Marseilles, he proceeded to Paris, and studied at the Lycée Louis-le-Grand. Desiring to follow the profession of teaching, he entered for examination at the École Normale supérieure, but failed, and the outbreak of war in 1870 debarred him from a second attempt. Having but small means, he turned his attention to private tuition, and at the same time tried his hand at literary criticism. After the publication of successful articles in the *Revue Bleue*, he became connected with the *Revue des Deux Mondes*, first as contributor, then as secretary and sub-editor, and finally as principal editor. In 1886 he was appointed professor of French language and literature at the École Normale, a singular honour for one who had not passed through the academic mill; and later he presided with distinction over various *conférences* at the Sorbonne and elsewhere. He was decorated with the Legion of Honour in 1887, and became a member of the Academy in 1893. The published works of M. Brunetière consist entirely of reprinted papers and lectures. They include five series of essays on French history and literature (1880-87), *Le Roman Naturaliste* (1883), *Histoire et Littérature*, three series (1884-86), *Questions de Critique* (1888), and a second series (1890). The first volume of *L'Évolution de Genres dans l'Histoire de la Littérature*, lectures in which a formal classification, founded on the Darwinian theory, is applied to the phenomena of literature, appeared in 1890; and his latest works include a series of studies on the evolution of French lyrical poetry during the 19th century, and various pamphlets of a polemical nature dealing with questions of education, science, and religion. M. Brunetière is strictly orthodox, and his political sympathies are in the main reactionary. He

possesses two prime qualifications of a great critic, vast erudition and unflinching courage. His mind is closely logical and intensely accurate, and he rarely makes a trip in the wide field of study over which it ranges. The most honest, if not the most impartial, of magisterial writers, he has a hatred of the unreal, and a contempt for the trivial: nobody is more merciless towards those who affect effete and decadent literary forms, or maintain a vicious standard of art. On the other hand, his intolerance, his sledge-hammer methods of attack, and a certain dry pedantry, have alienated the sympathies of many who recognize the remarkable qualities of his mind. The application of universal principles to every question of letters is a check to *dilettante* habits of thought, but it is apt to detain the critic in a somewhat narrow and dusty path. M. Brunetière's influence, however, cannot be disputed, and it is in the main thoroughly sound and wholesome.

Brünn (Czech, *Brno*), the capital of the Austrian margraviate and crown-land of Moravia. It has a special charter and is the seat of the district of the same name (consisting of the environs, with a population in 1900 of 132,480, chiefly Czech), as well as of the Diet and provincial authorities and of the provincial high court of justice for Moravia and Austrian Silesia. Population in 1880, 82,660; in 1890, 94,462—69 per cent. of whom are German and 31 per cent. Czech, a reversal of the proportions prevailing throughout the crown-land. Population in 1900, 109,346, chiefly Roman Catholic, with exception of about 7.5 per cent. Jews and 2 per cent. Protestants. There is a garrison of 4548. Its educational institutions include, in addition to the theological seminary and the polytechnic, 11 upper and lower gymnasias and high schools (6 German and 5 Czech), 13 continuation and technical schools, 6 intermediate, 34 elementary, and 17 municipal kindergarten schools. Brünn, which is sometimes styled "the Austrian Manchester," is the most purely industrial town of the monarchy. It has latterly maintained its position, without any marked alteration in the character of its production. Its main industries are woollen manufactures and more particularly cloth, leather, the machinery required in the textile factories, brewing, distilling and milling, and the production of sugar, oil, gloves, and hardware. The workers enjoy a comparatively high degree of prosperity. Five railway lines touch at Brünn, which has a very good connexion with Vienna. Suburban traffic is promoted by steam tramways and omnibuses. The fortifications of the old town have now been entirely removed, giving place to handsome gardens and well-built streets. The numerous new buildings in Brünn include the hall of the provincial Diet, a theatre, an industrial museum, the polytechnic, the German gymnasium, the Slav assembly rooms, and the German club. The racial antipathies are much less violent in Brünn than they are in Prague, although the same political and national differences prevail. There is a movement in favour of the re-establishment of a Moravian university in the town, but the Germans and Czechs cannot agree as to the language of instruction.

See HANAK, *Die Königliche Landes-Hauptstadt Brünn und die Umgebung* (Brünn, 1880), and works in German by D'ELVERT, *Neu-Brünn, wie es entstanden ist* (Brünn, 1889), DEUTSCH, and TRAUTENBERGER.

(Æ. O'N.)

Brünnnow, Franz Friedrich Ernst (1821-1891), German astronomer, was born in Berlin on 18th November 1821. Between the ages of eight and eighteen he attended the Friedrich-Wilhelm Gymnasium. In 1839 he entered Berlin University, where he attended lectures in mathematics, astronomy, and physics; chemistry, philosophy, and philology also occupying his attention.

After graduating as Ph.D. in 1843 he took an active part in astronomical work at the Berlin Observatory, under the direction of the celebrated Encke, contributing numerous important papers on the orbits of comets and minor planets to the *Astronomische Nachrichten*. In 1847 he was appointed director of the Düsseldorf Observatory. During his tenure of this post he published his well-known *Mémoire sur la comète elliptique de De Vico*, for which he received the gold medal of the Amsterdam Academy. In 1851 he succeeded Galle as first assistant at the Berlin Observatory. While occupying this position he computed his tables of the minor planet Flora, which were followed in 1859 and 1869 by tables of two other minor planets, Victoria and Iris. In 1854 he accepted the post of director of the new observatory of Ann Arbor, Michigan, U.S.A. Here he published for several years a journal entitled *Astronomical Notices*. In 1860 he went, as associate director of the observatory, to Albany, N.Y., whence he continued to issue his *Astronomical Notices*; but in 1861 he returned to Michigan, and threw himself with vigour into the work of studying the astronomical and physical constants of the observatory and the instruments it possessed. In 1863 he resigned the directorship of the Ann Arbor Observatory and returned to Germany, but three years later, on the death of Sir W. R. Hamilton, he accepted the post of Andrews professor of astronomy in the University of Dublin and Astronomer Royal of Ireland. The first task he undertook at the Dublin Observatory was the erection of an equatorial telescope to carry the fine object-glass which had been presented to the university by Sir James South. On the completion of this instrument he commenced his important researches on stellar parallax. The first, second, and third parts of the *Astronomical Observations and Researches made at Dunsink* contain the results of these labours, and include discussions of the distances of the stars α Lyrae, σ Draconis, Groombridge 1830, 85 Pegasi, and Bradley 3077, and of the planetary nebula H. iv. 37. In 1873 the observatory, on Dr Brünnow's recommendation, was provided with a first-class transit-circle which, with his usual thoroughness, he proceeded to test as a preliminary to commencing an extended programme of work with it, but in the following year, in consequence of failing health and eyesight, he resigned the post and retired to Basel. In 1880 he removed to Vevey, and in 1889 to Heidelberg, where he died on 20th August 1891. It was during his residence at Düsseldorf that he composed his *Lehrbuch der Sphärischen Astronomie*, on which, more perhaps than on any of his other works, his reputation will rest. Its importance was immediately recognized in Germany and other countries. In 1860 Part I. was translated into English by Main, the Radcliffe Observer at Oxford; in 1865 an English translation of the whole work by Brünnow himself appeared; while the fact that it reached a fourth edition, and has also been translated into French, Russian, Italian, and Spanish, proves how widely its value has been appreciated. (A. A. R.*)

Brunsbüttel, a seaport town of Prussia, province of Schleswig-Holstein, on the N. bank of the Elbe, 60 miles N.W. from Hamburg. It is the W. extremity of the North-Sea-Baltic Canal, which is closed at that end by double locks, estimated to have cost £771,750. Here also are an inner harbour, 1640 feet long and 656 feet wide, a coaling station, and a small harbour for the tugs and other vessels belonging to the canal company. Population (1900), 2151.

Brunswick (German, *Braunschweig*), a duchy of Germany; area, 1424 sq. miles; population (1885) 372,452, (1895) 434,213, of whom 215,772 were males and 218,441 females; density, 304.9 to the sq. mile. Except

for 19,508 Roman Catholics, the people belong almost entirely to the Lutheran church. The emigrants decreased from 333 in 1892 to 112 in 1899. Of the births annually 10 to 11 per cent. are illegitimate. The total number of farms in 1895 was 58,091, of which 38,901, or 67 per cent., were each less than $2\frac{1}{2}$ acres, 13,929 were between $2\frac{1}{2}$ and 25 acres, 5080 between 25 and 250 acres, and 181 exceeded 250 acres. In 1897 the live stock embraced 157,931 pigs, 149,149 sheep, 120,798 cattle, and 33,170 horses. The mines produced in the same year 1,057,192 tons of lignite, valued at £158,550; 108,502 tons of iron, valued at £10,800; 21,580 tons of potassium salts, valued at £148,850; or, in all, 1,187,274 tons of the value of £318,200 (£442,550 in 1898). There were also mined 44,262 tons of asphalt, valued at £12,650. The produce of the furnaces consisted of 26,285 tons of iron, valued at £71,200, and 16,499 tons of sulphuric acid. In 1898-99 the sugar factories and refineries produced 91,942 tons of sugar; the breweries, 13,530,000 gallons of beer; and the distilleries (1897) 375,850 gallons of pure alcohol. The duchy had 303 miles of railway in 1898. As reformed by laws of 1888 and 1899, the legislative assembly now consists of 48 members, thus elected by indirect voting—15 by the large towns, 15 by the country communes, and 18 by the learned professions, the clergy, landowners, manufacturers, and those who are assessed highest for income-tax. The assembly meets every two years, and the representatives sit for four years. The public revenue for the year 1900-01 was estimated at £787,500, and the public expenditure at £808,150. In addition to this the duke had a civil list of £180,630, derivable from domains, forests, &c.; and there was a special budget of £70,460, devoted to religion and education. The public debt, of which 80 per cent. was incurred for the construction of railways, amounted in 1899 to £913,317. The contribution to the imperial exchequer was fixed at £218,675 in 1900.

Brunswick, a town of Germany, capital of the duchy, 53 miles W. by N. from Magdeburg by the railway to Hanover. Most of the principal churches have been restored since 1895—the cathedral in 1891-92, St Peter's in 1888-92, St Martin's in 1897-99, St Catherine's in 1887-90, St Magnus in 1877, and St Andreas in 1899 onwards. Amongst the new secular buildings the first place is claimed by the ducal museum, built in 1883-87, in which are preserved the pictures collected by Duke Anthony Ulrich of Brunswick-Wolfenbüttel, a collection especially valuable for its Dutch canvases; it also contains collections of jewellery and Italian majolica. Other edifices are the post office (1878-81); synagogue (1875); the new town house, an Early Gothic sandstone structure (1896-99); and the technical high school, an Italian Renaissance building of 1877, furnishing quarters for the Caroline College, and for various scientific collections. Brunswick also possesses the Dankwarderode, a two-storeyed Romanesque building put up in 1884 on the site of part of the ancient citadel of the same name, which was destroyed by fire in 1873; two town halls, one containing a picture gallery, the other the municipal archives and municipal library; the municipal museum, in the old town house since 1899; the national museum; an anatomical museum; botanical gardens; and several parks; teachers' seminaries, deaf and dumb and blind asylums; and a national school of arboriculture. Nor should the many fine old houses be overlooked. There are also several monuments, the principal being those erected to Henry the Lion, a bronze fountain (1874); to the mathematician Gauss (1880), who was born here in 1777 (died 1855); to Lessing, by Rietschel (1853), Lessing having died here in

1781; two bronze equestrian statues (1894) of Dukes Charles William and Frederick William; a bronze monument to Franz Abt (1891); and a monument of the war of 1870-71. Brunswick is the seat of varied industries, the most noteworthy of which are sugar-refining, jute-spinning, manufacture of sewing and other machines, hardware, tobacco, beer, musical instruments, colours, lacquered wares, gloves, &c., printing and publishing, distilling, and gardening. Brunswick is famous for its sausages, honey cakes, asparagus, and Mumme beer. Owing to its central situation, at the intersection of the great route between the middle Rhine (Frankfort) and the middle Elbe (Magdeburg), and that between Hamburg and Leipzig, it is also the seat of a very active trade. The musician Spohr was born here in 1784 (died 1859). Population (1885), 85,174; (1890), 101,047; (1895), 115,138; (1900), 128,177.

See *Braunschweig, einst und jetzt* (Brunsw., 1897). (J. T. Bz.)

Brunswick, capital of Glynn county, Georgia, U.S.A., situated on St Simon Sound, 8 miles from the sea. It is a seaport of some importance, particularly in the export of cotton, has two railways, the Southern and the Plant System, and has considerable manufactures of yellow-pine lumber. Population (1880), 2891; (1890), 8459; (1900), 9081.

Brunswick, a city of Cumberland county, Maine, U.S.A., on the south bank of Androscoggin river, near its mouth. It is the terminus of several branches of the Maine Central railway. Bowdoin College, situated here, had in 1900 (including the Medical School of Maine), 34 professors and instructors and 356 students. Population (1880), 5384; (1890), 6012; (1900), 5210.

Brúsa, or BROUSSA, the capital of the Khudavendikar viláyet of Asia Minor, which includes parts of ancient Mysia, Bithynia, and Phrygia, and extends in a southeasterly direction from Mudánia, on the Sea of Marmora, to Afün Kara-hissar on the Smyrna-Konia railway. The viláyet is one of the most important in Asiatic Turkey, has great mineral and agricultural wealth, many mineral springs, large forests, and valuable industries. It exports cereals, silk, cotton, opium, tobacco, olive oil, meerschaum, boracite, &c. The Ismid-Angora and Eskishehr-Konia railways pass through the province. Population of the province, 1,600,000 (Moslems, 1,280,000; Christians, 317,000; Jews, 3000).

The city stretches along the lower slopes of the Mysian Olympus or Keshish Dag, occupying a position above the valley of the Nilafer (*Odrysses*) not unlike that of Great Malvern above the vale of the Severn. It is divided by ravines into three quarters, and in the centre, on a bold terrace of rock, stood *Prusa*, built by Prusias and long the capital of the Bithynian kings. The prosperity of Prusa, under Rome, is clear from the letters of Pliny the younger. The modern town has clean streets and good roads made by Ahmed Vefyk Pasha when Vali, and it contains mosques and tombs of great historic and architectural interest; the more important are those of Sultans Murad I., Bayezid I., Muhammad I., and Murad II., 1360-1451, and the Ulu Jami'. The mosques show traces of Byzantine, Persian, and Arab influence in their plan, architecture, and decorative details. The circular church of St Elias, in which the first two sultans, Osman and Orkhan, were buried, was destroyed by fire and earthquake, and rebuilt by Ahmed Vefyk Pasha. There are in the town an American mission and school, and a British orphanage. Silk stuffs, towels, burnús, carpets, felt prayer-carpets embroidered in silk and gold, are manufactured, and there are several factories in which silk is spun for export and home consumption. The hot iron and sulphur springs near Brúsa, varying in temperature from 112° to 178° F., are still much used. The town is connected with its port, Mudánia, by a railway and a road. There is a British Vice-Consul. Population, 75,000 (Moslems, 40,000; Christians, 33,000; Jews, 2000). (C. W. W.)

Brushes.—(1) *Wire*.—Brushes with tufts formed of steel wire are used for cleaning tubes and flues of steam boilers, for the purpose of removing the scale formed by

the products of combustion. Steel wire brushes are also used for cleaning scale from the interior surface of a boiler, or for removing the sand from the surface of a casting. Occasionally such brushes are revolved in a machine, for more convenient use on the article to be cleaned or polished.

A novel and effective use is made of a steel wire brush in utilizing it to form the active principle of what is known as Snyer's patent elastic clutch or coupling. The apparatus is for the purpose of coupling up or disconnecting a steam engine from a line of shafting used for transmitting power to machinery; or it may be used for coupling an engine and dynamo together, or other similar purpose. The clutch consists essentially of two discs, the adjacent faces of which are provided, one with a ring of brushes made of flat steel wire, the other with a number of finely serrated teeth. One of the discs is movable longitudinally on its shaft, and with the brushes clear of the serrations, the clutch is free. On closing together, which may be done with the engine running at speed, the elasticity of the brush permits the motion to be imparted gradually and without shock to the standing part, until both rotate and are locked together. These clutches are very powerful, and are capable of transmitting as much as 3000 horse-power.

(2) *Electric*.—An apparatus for conducting the electric current from the stationary portion, the field magnets, to the revolving part, the armature, of an electric dynamo or motor, is termed a "brush." There are usually two brushes to each dynamo or motor, and they are placed diametrically opposite, lightly touching the commutator of the armature.

It is important that there should be good metallic contact between the brushes and the commutator in order to avoid sparking, and at the same time the frictional resistance resulting from the contact must be at a minimum. To effect this result brushes are variously made. The kind of brush frequently used consists of a number of copper wires laid side by side and soldered together at one end, where the brush is held. Brushes are also made of strips of spongy copper cut like a comb, which give a number of bearing points on the commutator. Very good results are obtained from brushes made of copper gauze wound closely until it takes the exterior form of a rectangular block, which is held radially in a spring holder, and bears at the end on the commutator. In place of the gauze block, hard carbon blocks are frequently used and form the "brushes." (G. H. BA.)

Brussels (French, *Bruxelles*; Flemish, *Brussel*), capital of Belgium and of the province of Brabant, in 50° 51' N. lat., 4° 22' E. long., partly in the low-lying plain traversed from S. to N. by the Senne, partly on hills rising to the E. The ancient contour of the city is indicated by a line of fine boulevards occupying the place of its old fortifications. Beyond that circuit it has absorbed the neighbouring communes, by the laying out on the E. of the Avenue Louise, leading to the Bois de la Cambre; and also of the Park, with the Palace du Cinquantenaire, in which were held the Exhibitions of 1880, 1888, and 1897. In 1900 the city was extended on the N.W., where the lands near by the canal of Willebroeck were annexed for the accommodation of shipping establishments. The eight communes that immediately surround the city are those of St Josse-ten-Noode, Schaerbeek, and Laeken on the N.; Etterbeek and Ixelles on the E.; St Gilles on the S.; Anderlecht and Molenbeek-St-Jean on the W. These communes form, with Brussels, practically one vast town, without visible sign of their several boundaries. Since 1875 they have experienced a considerable development from the overflow of the population of Brussels, and enjoy, in fact, all the advantages of the capital without sharing its burdens. Thus Brussels is a spacious and handsome city, clean, healthy, and attractive to visitors, more especially since several of the old quarters, insanitary and crowded, have given way to well-aired streets and squares. This process of transformation dates from 1868, when, to remedy the constant exhalations and frequent inundations of the Senne, the course of that river in its passage through the city was enclosed by a great

arch, on each side of which were laid two large main sewers, into which the whole sewage system empties itself. Upon these subterranean buildings has been constructed a series of magnificent boulevards, which connect the Gare du Midi with the Gare du Nord, and along which a constant stream of tram and passenger traffic flows all day long and far into the night. Beginning in front of the Place de la Constitution, where is situated the Station du Midi, this Broadway bears the names successively of the Boulevard du Hainaut, Boulevard Anspach, Place de Brouckère, where the way divides into the Boulevard de la Senne (at the end of which the river issues out again into the open), and the Boulevard du Nord ending in front of the Place Rogier, where stands the Station du Nord. These thoroughfares are all distinguished by their elegant and varied architecture. Running parallel to this central way, there has been opened the Avenue du Midi, which, continued by the Rue du Midi, the Rue des Fripiers, the Place de la Monnaie, and the Rue Neuve, forms a second grand thoroughfare, leading also from the Gare du Midi to the Gare du Nord. Other grand thoroughfares and new quarters have been opened up in different parts of the city. Among the more remarkable squares and parks are the Public Park with its fine trees, situated between the Palais du Roi and the Palais de la Nation; the Square Frère-Orban (the old Place de la Société Civile), on which has been erected a statue of M. Frère-Orban; the Square du Petit Sablon, remarkable for the group in bronze of Counts Egmont and Hoorn, surrounded by eight statues of personages of the 16th century, and by the artistic iron railing; the Park Leopold, formerly the Zoological Gardens, whither has been transferred the Museum of Natural History, and in which, by private subscription, have been erected the Biological Institutes; the Parc du Cinquantenaire, a very beautiful avenue, leads to the Parc de Tervueren, in which is a museum of the Congo; the Bois de la Cambre, two miles from the Place Royale, at the extremity of the Avenue Louise; the squares Marie-Louise and Ambiorix; the Park of St Gilles, and the Parc de Laeken, adjoining the royal residence. The cathedral has been restored, and the famous Hotel de Ville (15th century) has also been completely repaired, both outside and inside. On the Grande Place, the Maison du Roi (16th century), its old foundations showing signs of giving way, was rebuilt in 1877 on its original plan. The old Guild-houses have likewise experienced a restoration of their façades according to their original aspect, and now form a curious and magnificent ensemble. Since the opening of the Central Boulevard numerous buildings of diverse styles have been erected on both sides. In the lower town the New Exchange (1874) has been erected in rich ornamental Renaissance, at a cost of four million francs. Other buildings are the Central Post Office (1892), a fine edifice in Renaissance, erected on the site of the ancient Hotel des Monnaies, opposite the Théâtre de la Monnaie; the Communal Theatre, intended specially for the representation of Belgian pieces; the Fish Halls (1883); the Halles Centrales (1874); the Marché Couvert for fruit, &c., in the Place St Géry; the Palais du Midi, a vast structure, comprising shops, markets, and an industrial school. On the slope and in the upper part of the city are the Hotel Central des Téléphones (1900), on the site of the former Palais de Justice; the new Palais de Justice, constructed in 1868-83, from designs by Polaert, and costing about fifty million francs, quadrangular in form, covering 270,000 square feet, surmounted by a dome, the cupola of which is about 330 feet above the pavement of the Salle des Pas Perdus. Opening into Place Polaert is the broad Rue de la Régence, in which are a synagogue (1878) in the Romanesque, the Royal Conservatorium of Music (1876) in Renaissance, the Palace

of the Count of Flanders, the Palace of the Fine Arts (1880), in which are placed the gallery of old pictures and the gallery of sculptures, while the modern pictures, as also the general archives of the kingdom, are alongside of the royal library in the old building of the picture gallery (Musée de Peinture), and the Museum of Natural History. In the Quartier-Léopold is the Musée Wiertz, where the paintings attract innumerable visitors. Beyond the Park, behind the Palais de la Nation and the Ministries, there are groups of fine buildings of recent construction, in which are the offices of the administration of railways and of that of the marine. In the commune of St Gilles a vast mint (Hotel des Monnaies) has been erected, and a prison of solitary confinement (1884) in Anglo-Gothic, able to accommodate 600 prisoners. The observatory, formerly placed at the north-east angle of the line of boulevards, was transferred in 1891 to Uccle. In the way of military quarters, all that is now left are a barrack for the grenadiers, and a barrack for the infantry of the line. At Etterbeek, about $1\frac{1}{2}$ miles from Brussels, handsome barracks have been built for the cavalry and artillery, with a large field for manœuvres; and close by, on the Ixelles ground, is a military hospital. There are new buildings, to serve as a military school, near the Parc du Cinquantenaire. In the Schaerbeek quarter is the barrack of Baudoin, occupied by the carabinieri, and, a little farther off, the national shooting-ground (1888), where, with the latest improvements, are about forty targets.

Among the industries of Brussels are its noted lace manufactures, cabinetmaking, the making of furniture, coachbuilding, jewellery, goldsmith's work, leather-glove and boot manufactures, the making of organs and pianos, wall-paper, soaps, &c.; important breweries, &c. Railway lines radiate in all directions: to Ostend, and thence by packet-boats to Dover and London; to Antwerp, and thence by steamer to Harwich and London; to Amsterdam; to Berlin and St Petersburg; to Vienna and Constantinople; to Basel, Rome, and Brindisi; to Paris and Marseilles; to Lille and Calais. Two canals, one from Charleroi, the other from Willebroeck, meet in Brussels on their way to the Rupel and the Escaut (see CANALS). The population of the commune of Brussels alone was 183,000 in 1875 and 183,686 in 1900. But the total population of the combined communes increased from 385,000 in 1875 and 465,317 in 1890 to 571,000 in 1899.

HENNE and WAUTERS. *Hist. politique, civile, et monumentale de la ville de Bruxelles*, 1843-45.—L. HYMANS. *Bruxelles à travers les âges*, 1881. (J. DU F.)

Brux, chief town of district of the same name in Bohemia, on the railway from Prague to Pilsen. Population (1890), 14,894; (1900), 21,525, mostly Catholic. There are important sugar, iron and hardware, distilling, brewing, and milling industries. Valuable lignite deposits are found in the neighbourhood, and the bitter waters at Püllna, Seidlitz, and Seidschütz are celebrated.

Bryan, William Jennings, (1860—) American politician and presidential candidate, was born in Salem, Illinois, 19th March 1860. His parents, well-to-do but not wealthy, were highly respected, his father serving twelve years as a circuit judge. After graduating from the classical course in Illinois College at Jacksonville in 1881, young Bryan took a full course in the Union College of Law, Chicago, supplementing his studies with work in the office of ex-Senator Trumbull. From 1883 to 1887 Mr Bryan practised law in Jacksonville. In 1887 he removed to Lincoln, Nebraska, which has since been his home. His success at the bar was much greater than usually comes to so young an attorney, but public

questions and his bent of mind turned his attention to politics. In 1890 the first Congressional district of Nebraska, a Republican stronghold, elected Mr Bryan as its representative in the fifty-second Congress, and in 1892 re-elected him to the fifty-third. He was placed on the Ways and Means Committee, an unusual honour to a new member, and was known as a worker. He also won high reputation as a debater. Two of his speeches in particular attracted wide attention, those against protection on the 16th March 1892, and against the repeal of the silver purchase clause of the Sherman Act, 16th August 1893. His zeal for bimetallism in the fifty-third Congress was the main cause of his failure to be re-elected to the next. As editor of the *Omaha World-Herald*, Mr Bryan championed bimetallism in the press as vigorously as he had advocated it in Congress, his articles being widely quoted and discussed. The Democratic party was radically divided on the monetary policy. To secure the repeal of the silver purchase clause of the Sherman Act, President Cleveland had used all the power he possessed. In spite of this, however, the sentiment in favour of opening the mints to the free coinage of silver rapidly gained in party favour, so that in the Democratic Convention of July 1896 at Chicago, nearly two-thirds of the delegates were against the administration and its gold régime. Mr Bryan was a delegate-at-large from Nebraska in this Convention. It was here, in the course of a heated debate on the proper Democratic attitude to the currency question, that he made his memorable declaration, "You shall not crucify mankind on a cross of gold." With the silver majority of the Convention he at once became an idol, and next day he was nominated as candidate for the Presidency. Mr Bryan spent the entire autumn of 1896 upon the hustings. He opened the campaign in the centre of the "gold" country, at Madison Square Garden, New York, with an address of remarkable ability. He visited more than half the States of the Union and delivered more than six hundred speeches. But the opposition both without and within the Democratic party was too strong to be overcome. At the election in November the popular vote was 7,107,822 for McKinley and 6,511,073 for Bryan. Of the electoral votes McKinley received 271 and Bryan 176. Though defeated Mr Bryan not only remained the undisputed leader of the Democrats, but his power and the respect accorded to him rapidly increased. Between 1896 and 1900, except the six months of the Spanish war, in which he served as colonel of the Third Nebraska Volunteers, Mr Bryan devoted his entire time to study, speaking and writing in the interest of his party. His ability, his sincerity of character, his wide information, and his quick and accurate grasp of the new issues arising from the Spanish war, of which "imperialism" was the most momentous, drew to him the support of many who had opposed him in 1896. As the time for the Democratic Convention of 1900 drew on, it was seen that he was the only possible candidate. He was again nominated for the Presidency, and again he spent his whole time through the campaign upon the hustings. He was, however, once more defeated by the Republican candidate, the popular vote standing 7,206,677 for Mr McKinley, and 6,374,397 for Mr Bryan, and the electoral vote 292 to 155. This result appears to have been mainly due to the fact that the platform again demanded the free coinage of silver.

Bryansk, a district town of middle Russia, in the government and 90 miles by rail W.N.W. of Orel, picturesquely situated at the confluence of the Desna with the Bolva, which brings it in connexion with Kieff, *via* the navigable Desna. Since it has been connected by rail with

Riga, *via* Vitebsk, and the south-western railways *via* Gomei, it has rapidly grown in importance, both as a depot for the export of grain, and chiefly hemp, and as an industrial centre. The exports *via* the Desna alone (grain, timber, oils, tar and pitch, metallic goods) are valued at £110,000 per annum, while nearly 50,000 cwts. of hemp and £10,000 worth of hempseed oil are sent to St Petersburg every year. It contains large gun works of the Crown, several hemp-spinning mills, rope works, &c. The Bryansk Byezhitsk works close by, at the junction of the Desna with the Dnieper, have grown to be one of the most considerable centres in Russia for the manufacture of railway rails and bridges, employing 5000 workers. Population, 23,520.

Bryant, William Cullen (1794-1878), American poet and journalist, was born at Cummington, a farming village in the Hampshire hills of Western Massachusetts, 3rd November 1794. He was the second son of Peter Bryant, a physician and surgeon of no mean scholarship, refined in all his tastes, and a public-spirited citizen. Peter Bryant was the great-grandson of Stephen Bryant, an English Puritan emigrant to Massachusetts Bay about the year 1632. The poet's mother, Sarah Snell, was a descendant of "Mayflower" pilgrims. He was born in the log farmhouse built by his father two years before, at the edge of the pioneer settlement among those boundless forests, the deep stamp of whose beauty and majesty he carried on his own mind and reprinted upon the emotions of others throughout a long life spent mainly amid the activities of his country's growing metropolis. By parentage, by religious and political faith, and by hardness of fortune, the earliest of American poets was appointed to a life severely typical of the first century of American national existence, and of the strongest single racial element by which that nation's social order has been moulded and promoted. Rated by the amount of time given to school books and college classes, Bryant's early education was limited. After the village school he received a year of exceptionally good training in Latin under his mother's brother, the Rev. Dr Thomas Snell, of Brookfield, followed by a year of Greek under the Rev. Moses Hallock, of Plainfield, and at sixteen entered the sophomore class of Williams College. Here he was an apt and diligent student through two sessions, and then, owing to the straitness of his father's means, he withdrew without graduating, and studied classics and mathematics for a year, in the vain hope that his father might yet be able to send him to Yale College. But the length of his school and college days would be a very misleading measure of his training. He was endowed by nature with many of those traits which it is often only the final triumph of books and institutional regimen to establish in character, and a

WILLIAM CULLEN BRYANT.
(From a photo by Sarony, New York.)

double impulse toward scholarship and citizenship showed its ruling influence with a precocity and an ardour which gave every day of systematic schooling many times its ordinary value. It is his own word that, two months after beginning with the Greek alphabet, he had read the New Testament through. On abandoning his hope to enter Yale, the poet turned to and pursued, under private guidance at Worthington and at Bridgewater, the study of law. At twenty-one he was admitted to the bar, opened an office in Plainfield, presently withdrew from there, and at Great Barrington settled for nine years in the attorney's calling, with an aversion for it which he never lost. His first book of verse, *Thanatopsis*, appeared in 1817.

At the age of twenty-six Bryant married, at Great Barrington, Miss Frances Fairchild, with whom he enjoyed a happy union until her death nearly half a century later. In the year of his marriage he suffered the bereavement of his father's death. In 1825 he ventured to lay aside the practice of law, and removed to New York city to assume a literary editorship. Here for some months his fortunes were precarious, until in the next year he became one of the editors of the *Evening Post*. In the third year following, 1829, he came into undivided editorial control, and became also chief owner. He enjoyed his occupation, fulfilling its duties with an unflagging devotion to every worthy public interest till the end of his life, which came in 1878, in the month of his choice, as indicated in his beautiful poem entitled "June."

Though Bryant's retiring and contemplative nature could not overpower his warm human sympathies, it yet dominated them to an extent that made him always, even in his journalistic capacity and in the strenuous prose of daily debate, a councillor rather than a leader. It was after the manner of the poet, the seer, that he was a patriot, standing for principles much more than for measures, and, with an exquisite correctness which belonged to every phase of his being, never prevailing by the accommodation of himself to inferiors in foresight, insight, or rectitude. His vigorous and stately mind found voice in one of the most admirable models of journalistic style known in America. He was founder of a distinct school of American journalism, characterized by an equal fidelity and temperance, energy and dignity. Though it is as a poet that he most emphatically belongs to history, his verse was the expression of only the gentler motions of his mind; and it gathers influence, if not lustre, when behind it is seen a life intrepid, upright, glad, and ever potent for the nobler choice in all the largest affairs of his time. His renown as a poet antedated the appearance of his first volume by some four or five years. "American poetry," says Richard Henry Stoddard, "may be said to have commenced in 1817 with . . . (Bryant's) 'Thanatopsis' and 'Inscription for the entrance of a wood.'" The solemn chords of "Thanatopsis," revealing a voice at once as new and as old as the wilderness out of which they reverberated, had been written at Cummingtown in the poet's eighteenth year, the "Inscription" in his nineteenth, and in his twenty-first, while a student of law at Bridgewater, he had composed his lines "To a Water-fowl," whose exquisite beauty and exalted faith his own pen rarely, if ever surpassed. The poet's gift for language made him a frequent translator, and among his works of this sort his rendering of Homer is the most noted and most valuable. But the muse of Bryant, at her very best, is always brief-spoken and an interpreter initially of his own spirit. Much of the charm of his poems lies in the equal purity of their artistic and their moral beauty. On the ethical side they are more than pure, they are—it may be said without derogation—Puritan. He never commences

with unloveliness for any loveliness that may be plucked out of it, and rarely or never discovers moral beauty under any sort of mask. As free from effeminacy as from indelicacy, his highest and his deepest emotions are so dominated by a perfect self-restraint that they never rise (or stoop) to transports. There is scarcely a distempered utterance in the whole body of his poetical works, scarcely one passionate exaggeration. He faces life with an invincible courage, an inextinguishable hope and heavenward trust, and the dignity of a benevolent will which no compulsion can break or bend. The billows of his soul are not waves, but hills which tempests ruffle but can never heave. Even when he essays to speak for spirits unlike his own—characters of history or conceptions of his own imagination—he never with signal success portrays them in the bonds, however transient, of any overmastering passion. For merriment he has a generous smile, for sorrow a royal one; but the nearest he ever comes to mirth is in his dainty rhyme, "Robert of Lincoln," and the nearest to a wail in those exquisite notes of grief for the loss of his young sister, "The Death of the Flowers," which only draw the tear to fill it with the light of a perfect resignation. As a seer of large and noble contemplation, in whose pictures of earth and sky the presence and care of the Divine mind, and every tender and beautiful relation of man to his Creator and to his fellow, are melodiously celebrated, his rank is among the master poets of America, of whom he is historically the first. (G. W. C.A.)

Brynmawr, a market town of South Wales, in the county of Brecknock, $14\frac{1}{2}$ miles S.E. of Brecknock, with a station on the London and North-Western railway. Since 1894 it has been governed by an urban district council. Population of the urban district (1891), 6413; (1901), 6833.

Bryophyta.—This great subdivision of the vegetable kingdom was treated so fully in the article *MUSCINEÆ* (see *Ency. Brit.* vol. xvii.), that only a brief supplementary note is necessary to indicate the nature of the extension of our knowledge of the Mosses and Liverworts since the date of its publication. The more recent work has shown that in the Bryophyta we have a group of plants, the evolution of which has proceeded on somewhat similar lines to that of the higher plants as regards the adaptation of the organism to the conditions under which it lives. The important distinction for morphological purposes, that in the Bryophyta the leafy plant is the sexual generation, while the corresponding modifications are found in the sporophyte of the higher plants, only gives a special value to the comparison of the two groups, since the adaptations can be seen to have arisen independently. It will be sufficient here to point out some of the characters of Liverworts and Mosses which receive their explanation in this way, and to refer for details to the works cited at the end of this article. Starting from the structure found in the simpler thalloid forms, the development of more or less specialized leaves to meet the requirements of assimilation can be seen. A series illustrating the passage from the frondose to the foliose condition is afforded by the anacrogynous *Jungermanniaceæ*, several interesting new forms of which have been discovered. In some of the acrogynous *Jungermanniaceæ* also the main assimilating surface is a flat thallus, only the branches which bear the reproductive organs being leafy. On the other hand, a specialization of the upper surface of a thallus for this purpose can be traced in a series of forms from the *Ricciaceæ* to the *Marchantiaceæ*, culminating in the structure found in such a liverwort as *Marchantia*. The leafy shoot of the sexual generation of the Mosses may be cited

lastly. In one moss (*Buxbaumia aphylla*), this is so simple that the well-developed protonema bears either solitary scale leaves, or a simple stem with several leaves around the sexual organs. This has been regarded by Goebel as the simplest form of moss, but the complexity of the capsule, combined with the fact that the plant is probably a saprophyte, makes the validity of this inference questionable. The view that in *Buxbaumia* we have a reduced rather than a primitive form, is supported by the presence of a well-developed leafy shoot in the mosses which appear to be most closely allied to it. In connexion with the partial saprophytism of many of the Bryophyta, the occurrence of fungal hyphæ in their rhizoids, forming a mycorrhiza, may be noted. The *Splachnaceæ*, a group of mosses growing on dung and decomposing animal substances, exhibit in their conspicuousness, and in their coherent and sticky spores, characters which may be regarded as adaptive; the spores of these mosses are probably carried to the localized droppings, on which the plants are found, by the agency of flies. Another group of adaptive characters is related to the protection of the organism against drought. Many Bryophyta are capable of withstanding prolonged desiccation, recovering on being moistened, and show no special arrangements for their preservation through a dry period. Others, however, do show special adaptations to this end, such as the rolling up of the thallus in certain *Marchantiaceæ*, the presence of the auricles on the leaves of some *Jungermanniaceæ* (which serve for water-storage, and are most common in epiphytic or epiphyllous forms), and the rolling up of the leaf in the *Polytrichaceæ*. In connexion with this the not infrequent occurrence of underground tubers may be mentioned; these start the growth of the plant after the dry season is over, and thus serve as a means of vegetative multiplication. Special arrangements have also been shown to exist in the structures adjoining the sexual organs, the function of which is to increase the chance of the spermatozoids being brought within the range of the attractive power of the archegonium; the attraction appears to be due to the irritability of the spermatozoids to certain chemical substances. With regard to the sporophyte, evidence has accumulated, from a study of its structure and from experimental work, that the larger sporogonia of some Mosses and the *Anthocerotæ* are to a considerable extent independent of the gametophyte. Their assimilating tissue may be well developed, especially in the apophysis, which bears true stomata, and in the arrangement of its cells recalls the mesophyll of some foliage leaves. Various types of spore-dispersal have also been recognized in the moss sporogonium. It will be evident that, until a considerable insight into the origin of such characters is obtained, the value of their application to the determination of relationship cannot be estimated; but it may be pointed out that their bearing on the classification of the Bryophyta, which is to some extent founded on differences in leaf-form, &c., along with more trustworthy characters, is an important one.

As to the relationship of the Bryophyta, on the one hand, to the *Algæ*, and on the other to the Vascular Cryptogams, little can be added to what is said in the original article. In connexion with the hypothesis advanced by Bower to explain the origin of the latter group, in which the strobilus of a Vascular Cryptogam, such as *Equisetum*, is regarded as the equivalent of the sporogonial head, the article on PTERIDOPHYTES may be referred to. The significance of the Bryophyta as affording an insight into the possible mode of origin of the independent, leafy sporophyte of the Pteridophyta is obvious, whether we regard the two groups as nearly related or not. The alteration found in the two is a strictly similar one: investi-

gations into the nuclear changes have shown that in Bryophytes the reduction in number of the chromosomes takes place in the spore-mother-cells, and that thus the same cytological difference exists between gametophyte and sporophyte. While apogamy is not known, some mosses have been shown to be aposporous; in *Funaria* the protonemal filaments may arise from a sporogonium while still attached to the moss plant. Thus the one generation may arise vegetatively from the other in Mosses as in Ferns. This brief account will serve to show that, while our knowledge of the details of morphology and natural history has increased, the general point of view in the original article needs no amendment, while the systematic works cited below will show to what extent the classification of the Bryophyta has been modified by the additional facts brought to light.

For further information the reader may consult:—CAMPBELL. *Mosses and Ferns*. London, 1895.—ENGLER and PRANTL. *Die natürlichen Pflanzenfamilien*, Theil i. Abth. 3. Leipzig, 1893-1900.—GOEBEL. *Organographie der Pflanzen*. Jena, 1898. Full references to the recent literature of the subject will be found in all these works.

(W. H. L.)

Brzezany, a town in Galicia (Austria). Population of town and commune (1890), 11,221; (1900), 11,244; besides a garrison of 832 men. It has leather manufactures, and trade in corn, spirits, and agricultural produce.

Bucaramanga, capital of the department of Santander, Colombia, South America, 185 miles N.N.E. of Bogota. It is a town of considerable commercial activity, connected with the Magdalena river by a railway, and is well built and prosperous, the streets being lighted by electricity. There are gold, copper, and iron mines in the neighbourhood. Population, 18,000

Buchanan, Robert Williams (1841-1901), British poet, novelist, and dramatist, son of Robert Buchanan (1813-1866), Owenite lecturer and journalist, was born at Caverswall, Staffordshire, on 18th August 1841. His father, a native of Ayr, after living for some years in Manchester, removed to Glasgow, where Buchanan was educated, at the High School and the University, one of his fellow-students being the poet David Gray. His essay on Gray, originally contributed to the *Cornhill Magazine*, tells the story of their close friendship, and of their journey to London in 1860 in search of fame. After a period of struggle and disappointment Buchanan published *Undertones* in 1863. This "tentative" volume was followed by *Idyls and Legends of Inverburn* (1865), *London Poems* (1866), and *North Coast and other Poems* (1868), wherein he displayed a faculty for poetic narrative and a sympathetic insight into the humbler conditions of life. On the whole, Buchanan is at his best in these narrative poems, though he essayed a more ambitious flight in *The Book of Orm: A Prelude to the Epic*, a study in mysticism, which appeared in 1870. He also became a frequent contributor to periodical literature, and obtained notoriety by an article which, under the *nom de plume* of Thomas Maitland, he contributed to the *Contemporary Review* for October 1871, entitled "The Fleshly School of Poetry." This article was expanded into a pamphlet (1872), but he subsequently withdrew from the criticisms it contained, and it is chiefly remembered by the replies it evoked from D. G. Rossetti in a letter to the *Athenæum* (16th December 1871), entitled "The Stealthy School of Criticism," and from Mr Swinburne. In 1876 appeared *The Shadow of the Sword*, the first and one of the best of a long series of novels. Buchanan was also the author of many successful plays, among which may be mentioned *Lady Clare*, produced in 1883; *Sophia* (1886), an adaptation of *Tom Jones*; *A Man's Shadow* (1890); and *The Charlatan*

(1894). In 1896 he became, so far as some of his work was concerned, his own publisher. In the autumn of 1900 he had a paralytic seizure, from which he never recovered. He died at Streatham on 10th June 1901.

Buchanan's poems were collected into three volumes in 1874, and again, more completely, into one volume in 1884. This volume contains, besides the poems mentioned above and many others, "The Drama of Kings" (1871); "St Abe and his Seven Wives," a lively tale of Salt Lake City, published anonymously in 1872; and "Balder the Beautiful" (1877). He afterwards published (among others) "The City of Dream" (1888); "The Outcast: a Rhyme for the Time" (1891); and "The Wandering Jew" (1893). His earlier novels, *The Shadow of the Sword* and *God and the Man* (1881), a striking tale of a family feud, are distinguished by a certain breadth and simplicity of treatment which is not so noticeable in their successors, among which may be mentioned *The Martyrdom of Madeline* (1882); *Foxglove Manor* (1885); *Effie Hetherington* (1896); and *Father Anthony* (1898). *David Gray and other Essays, chiefly on Poetry* (1868); *Master Spirits* (1873); *A Poet's Sketch Book* (1883), in which the interesting essay on Gray is reprinted; and *A Look round Literature* (1887), contain Buchanan's chief contributions to periodical literature. More valuable is *The Land of Lorne* (two vols. 1871), a vivid record of yachting experiences on the west coast of Scotland.

(R. G.)

Bucharest, or BUCAREST (Rumanian, *București*), the capital of Rumania, in the province of Ilfov, on the Dimbovitza, 30 miles from the Danube. It is the residence of the king and court, the seat of government and of the metropolitan primate, and has increased in an extraordinary degree in general importance, more especially since the foundation of the kingdom and of the present dynasty. It now occupies an area of more than 20 square miles, and is surrounded by a girdle of fortifications, planned by the celebrated Belgian engineer General Brialmont, extending over a circuit of 45 miles, and comprising 18 forts mounted with the latest inventions in movable cupolas and siege cannon. Many imposing public buildings and private mansions have been erected during recent years, and new streets and boulevards constructed. The paving throughout with granite blocks, and even in parts of the central street, the Calca Victoriei, with wood, and the use of the electric light in its main arteries have given to this so-called Paris of the East an entirely novel aspect, and completely removed all trace of the Oriental character it once possessed. The river Dimbovitza has been provided with handsome quays, and the broad boulevard Elizabeth, which meets it at right angles, extends from the palace of the crown prince and princess at Cotroceni to the barrier of the cattle market, west to east, a distance of some 4½ miles. Another new boulevard meets the Chaussée Kisseleff. This latter, the Bois de Boulogne of Rumania's capital, terminates in the prettily situated racecourse of Băneasa, where spring and autumn meetings are held. The new public buildings are to be found chiefly on the quays of the Dimbovitza, the Calca Victoriei, and the main boulevards. They comprise the remodelled royal palace, the ministries of state (with the exception of the ministry of the interior, all of recent construction), the national bank, the deposit bank, the post office, the law courts, the prefecture, the athenæum (used for literary conferences and for concerts), the court of public accounts, the state printing-office, &c. To these must be added the arsenal, on the outskirts of the town, the cavalry barracks on the plateau of Cotroceni, the infantry barracks at Dealu Spirei, and those for the regiments of the Chasseurs (Vânători) of the Calarasi and Dorobanti at Malmaison, affording in all accommodation for about 30,000 troops.

As to population Bucharest has increased considerably. It amounted in 1890 to about 250,000, and though more or less stationary until 1895, it has since that date, according to the census of 1900, increased to 282,071, of whom 53,056 are foreigners (mostly Austro-Hungarian subjects)

and 43,274 are Jews. The great bulk of the population are Rumanians of the Greek orthodox religion. There are at least 350 churches of this creed in the capital, the most noticeable being the Metropoli or Cathedral, the church of Doamna Balașă, and that of St Spiridon. The Roman Catholic community is a large one, numbering as many as 30,000, but there are only three Roman Catholic places of worship, including the cathedral of St Joseph. Educational institutions have also made great progress, for besides the university there are now no less than fifty public schools, not to mention numerous Catholic and Lutheran foundations.

The general sanitary and other improvements are certainly noteworthy, and include, besides the gas and electric lighting and well-paved streets, an almost universally applied system of canalization and water-supply, and electric and horse tramways in all the principal thoroughfares. Manufactories have also sprung up in the neighbourhood of the town, and of these the chief are the gunpowder factory at Dudesci, some 7 miles distant; the sugar factory at Chitila; brick, tile, pipe, and terra-cotta works at Cotroceni; three large breweries, linseed-oil mills, and a rope and waterproof cloth factory. With this increase in importance and general welfare, the railway system of Rumania has been so far extended that her capital is now in communication with the rest of the continent by six lines.

1. By that of Bucharest, Verciorova with Austria-Hungary.
2. By that *viâ* Predeal with Transylvania.
3. By that *viâ* Burdujeni with Austria and Germany.
4. By that *viâ* Jassy-Ungheni with Russia.
5. By the Giurgevo line with Bulgaria; and
6. By the Constantza line over the New Danube Bridge with the Black Sea, and so by the Rumanian Maritime Service (*Serviciul Maritim*) with Constantinople and the east.

Besides a complete external and internal telegraphic service, Bucharest is also in telephonic communication with Sinaia, the summer residence of the court in the Carpathians, and with the ports of Galatz and Braila, and with Jassy.

Among the most important philanthropic institutions may be mentioned the Coltei Hospital, the Asile Elena Doamna, and the Brancovan, Maternitate, Philantropia, Pantelimon hospitals, and the Marcutza lunatic asylum. Good hotels and restaurants are also plentiful. There are, however, only two theatres properly so called, the National Theatre, restored in 1895-96, and the Lyric Theatre, chiefly patronized by foreign artistes. There are besides two large concert halls. There is also a large increase in the number of clubs, political, social, and sporting. Socially, indeed, the progress of Bucharest is remarkable, its political, literary, and scientific *coteries* being of a character to place it on a level with most European capitals. The local colouring of the town is rapidly disappearing with the speedy march of Western civilization; and with the increasing number of houses of several storeys, the room available for the small gardens which once formed so marked a feature is yearly becoming less, although the few public squares and gardens, such as the Cismegiu, Place St Georges, the gardens of the Episcopoi and Icoanei, remain for the present intact. The excellent cabs, however, driven by Russian coachmen of the peculiar Lipovan sect, the itinerant retail vendors, with their doleful street-cries and often picturesque country dresses, and the native gypsies, whether musicians or employed in building houses, still strike the eye of the foreigner as a last vestige of the Oriental past.

Bucher, Lothar (1817-1892), German publicist, was born on 25th October 1817, at Neu Stettin, in Pomerania, his father being master at a gymnasium. After studying at the University of Berlin he adopted the legal profession. Elected a member of the National Assembly in Berlin in 1848, he was an active leader of the extreme democratic party. With others of his colleagues he was in 1850 brought to trial for having taken part in organizing a movement for refusal to pay taxes; he was condemned to fifteen months' imprisonment in a fortress, but left the country before the sentence was executed. For ten years he lived in exile, chiefly in London; he acted as special correspondent of the *National Zeitung*, and gained a great knowledge of English life; and he published a work, *Der Parlamentarismus wie er ist*, a criticism of parliamentary government, which shows a marked change in his political opinions. In 1860 he returned to Germany, and became intimate with Lassalle,

who made him his literary executor. In 1864 he was offered by Bismarck, and accepted, a high position in the Prussian Foreign Office. The reasons that led him to a step which involved so complete a break with his earlier friends and associations are not clearly known. From this time till his death he acted as Bismarck's secretary, and was the man who probably enjoyed the greatest amount of his confidence. It was he who drew up the text of the constitution of the North German Confederation; in 1870 he was sent on a very confidential mission to Spain in connexion with the Hohenzollern candidature for the Spanish crown; he assisted Bismarck at the final negotiations for the treaty of Frankfurt, and was one of the secretaries to the Berlin Congress; he also assisted Bismarck in the composition of his memoirs. Bucher, who was a man of great ability, had considerable influence, which was especially directed against the economic doctrines of the Liberals; in 1881 he published a pamphlet criticizing the influence and principles of the Cobden Club. He identified himself completely with Bismarck's later commercial and colonial policy, and probably had much to do with introducing it, and he did much to encourage anti-British feeling in Germany. He died at Glion, in Switzerland, on 12th October 1892.

HEINRICH V. POSCHINGER. *Ein J8er: Lothar Buchers Leben und Werke*, 3 vols. Berlin, 1890.—BUSCH. *Bismarck: some Secret Pages of his History*. London, 1898. (J. W. Ha.)

Buchholz, a town of Germany, on the Sehma, 18 miles S. by E. of Chemnitz by rail, in the circle of Zwickau, kingdom of Saxony. There is a school for instruction in lace-making, an industry dating from 1589, and now counting over 80 factories. Population (1890), 7808; (1900), 8402.

Buckie, a fishing town and police burgh and railway station of Banffshire, Scotland, on the Moray Firth, at the mouth of the Buckie burn, about 21 miles W. of Banff. It attracts one of the largest Scottish fleets in the herring season, and is also the chief seat of line fishing in Scotland. The value of the fish landed in 1899 was £34,247, and the port had 232 boats of 6106 tons. There are two harbours, one of 9 acres, with half a mile of quayage. There are engineering works and distilleries. A literary institute contains library and recreation rooms. Population (1891), 5849; (1901), 6541. (See BANFFSHIRE for statistics of fishing district.)

Buckingham, a municipal borough and market town of Buckinghamshire, England, 61 miles N.W. of London by rail, on the Ouse, in (since 1885) the Northern parliamentary division of the county. Milk-condensing and the preparation of artificial manure are recently introduced industries. Area, 5007 acres; population (1881), 3585; (1891), 3364; (1901), 3151.

Buckinghamshire, a south midland county of England, bounded on the N. by Northampton, on the W. by Oxford, on the S. by the Thames, and on the E. by Middlesex, Hertford, and Bedford.

Area and Population.—The area of the ancient and administrative county, as given in the census returns, is 475,694 acres, or 743 square miles. Population (1881), 176,155; (1891), 185,284 (of whom 91,195 were males, and 94,089 females, the number of persons per square mile being 249, and of acres to a person 2·57); (1901), 195,534. In 1895 the area of the administrative county was slightly altered, part of the parish of Ibstone, and the parish of Stokenchurch in Oxford being transferred to Buckingham, while part of the parish of Kingsey in Buckingham was transferred to Oxford. The area of the registration county is 410,242 acres, with a population in 1891 of 164,442, of whom 43,190 were urban, and 121,252 rural; and in 1901 of 173,060. Within this area the increase of population between 1881 and 1891 was 5·57 per cent. The excess of births over deaths between 1881 and 1891 was 21,762, but the increase of the resident

population was only 8669. The following table gives the numbers of marriages, births, and deaths, with the number of illegitimate births, for 1880, 1890, and 1898:—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				Male.	Female.
1880	906	4875	2801	142	106
1890	1038	4529	2645	108	112
1898	1174	4848	2464	104	75

The number of marriages in 1899 was 1203, of births 4385, and of deaths 2649.

The following table gives the marriage-, birth-, and death-rates with the percentage of illegitimate births for a series of years:—

	1870-79.	1880.	1880-89.	1890.	1888-97.	1898.
Marriage-rate	12·8	11·6	12·3	12·7	12·7	13·8
Birth-rate	33·2	31·2	30·8	27·7	28·1	25·5
Death-rate	19·0	17·9	17·0	16·2	15·4	14·5
Percentage of illegitimacy	5·4	5·1	5·0	4·9	4·5	4·1

Both the birth-rate and the death-rate were below the average for England. In 1891 there were in the county 626 natives of Scotland, 496 natives of Ireland, and 273 foreigners.

Constitution and Government.—The ancient county is divided into three parliamentary divisions, and it also includes part of the parliamentary borough of Windsor. The administrative county contains two municipal boroughs, Buckingham and Chipping Wycombe. The following are urban districts: Aylesbury, Beaconsfield, Chesham, Eton, Fenny Stratford, Linslade, Marlow, Newport Pagnell, and Slough. The county is in the midland circuit, and spring and summer sessions are held at Aylesbury. The boroughs of Buckingham and Chipping Wycombe have separate commissions of the peace. The ancient county, which is in the diocese of Oxford, contains 207 entire ecclesiastical parishes or districts with parts of others.

Education.—Eton college is within the county, and there is a board school for deaf children at Chipping Wycombe. The number of elementary schools on 31st August 1899 was 257, of which 67 were board schools, and 190 voluntary, the latter including 173 Church of England schools, 2 Wesleyan, 3 Roman Catholic, and 12 "British and other." The average attendance at board schools was 11,727, and at voluntary schools 20,006. The total school board receipts for the year ending 29th September 1899 were £38,315. The income under the Agricultural Rates Act was over £1468.

Agriculture.—There are considerable varieties of soil. On the lower grounds, especially in the vale of Aylesbury, it is remarkably fertile, but on the hills it is usually poor and thin. The district round Aylesbury is still famous for its ducks, large numbers being fattened for the London market. About eleven-twelfths of the total area of the county is under cultivation, and of this more than three-fifths is in permanent pasture, which is gradually increasing. Over 3500 acres are under orchards, and about 32,000 acres under woods. The acreage under corn crops, and especially that under wheat, has within recent years greatly decreased. While wheat in 1880 occupied 50,391 acres, its average acreage is now only about 35,000. Turnips and swedes are the principal green crops, cattle being chiefly kept both for feeding and for dairy purposes. The following table gives the larger main divisions of the cultivated area at intervals of five years from 1880:—

Year.	Total Acreage under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	405,899	125,035	32,536	31,040	200,774	16,514
1885	408,361	115,953	34,740	32,070	216,461	9,137
1890	405,364	107,476	29,661	30,491	228,456	9,012
1895	401,232	95,437	26,819	31,901	235,850	10,486
1900	400,276	92,855	25,598	31,470	243,887	5,872

The following table gives particulars regarding the principal live stock for the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	17,794	68,180	28,208	195,764	31,170
1885	17,753	76,912	31,734	280,152	37,429
1890	17,503	69,913	30,500	213,533	38,952
1895	18,483	66,153	28,645	192,609	40,047
1900	18,182	75,183	31,308	195,567	28,098

Industries and Trade.—According to the annual report of the inspector of factories for 1898 (1900), the total number of persons employed in textile and non-textile factories and workshops in 1897 was 13,286, as compared with 12,568 in 1896. The number of persons employed in non-textile factories in 1897 was 10,313, between 1895 and 1896 there was an increase of 10·6 per cent., and between 1896 and 1897 an increase of 6·2 per cent.; as many as 3795 were employed in the manufacture of machines, conveyances, tools, &c., and 2095 in the manufacture of paper. In workshops 2962 persons were employed, of whom 1537 were employed in the furniture industry. The clothing, lace, and straw-plait manufactures continue to prosper, and there is a thriving trade, especially at High Wycombe, in various articles of turnery, such as chairs, spades, and bowls, from beech and other hard woods. Of clay 8680 tons were raised in 1899.

AUTHORITIES.—The original standard history is the laborious and sumptuous work of LIPSCOMB, 4 vols., London, 1847. A later work is GIBB, *Buckingham*, Aylesbury, 1878-82. Mention may also be made of the same author's *Worthies of Buckingham*, Aylesbury, 1886; and his *Buckingham Miscellany*, Aylesbury, 1891. Other works are SHEAHAN, *History and Topography of Buckinghamshire*, London, 1862; KENNEDY, *Birds of Berkshire and Buckinghamshire*, Eton, 1868; and G. S. ROSCOE, *Buckingham Sketches*, London, 1891.

Buckner, Samuel Bolivar (1823—), American soldier, was born in Hart county, Kentucky, on 1st April 1823, and graduated at West Point in 1844. He resigned from the army in March 1855 to practise law and politics. He was adjutant-general and commander of the state guard of Kentucky, in the Southern interest, May-July 1861. Presently, under a commission, he invaded his native state. As brigadier in command he surrendered Fort Donelson to General Grant on 16th February 1862, with 16,000 troops and vast stores, his superiors Floyd and Pillow escaping. After his exchange as a prisoner of war, he fought under General Bragg at Murfreesboro' and Chickamauga. After the war he served as governor of Kentucky (1887-91), and in 1896 was candidate of the gold Democrats for vice-president of the United States.

Bucyrus, capital of Crawford county, Ohio, U.S.A. It is situated in the northern part of the state, 62 miles north of Columbus, on Sandusky river and on the Pennsylvania and the Ohio Central railways, at an altitude of 991 feet. Its manufactures consist largely of agricultural tools and machines. Population (1880), 3835; (1890), 5974; (1900), 6560.

Buczacz, a district-town in Eastern Galicia, Austria, on the Strypa, a tributary of the Dniester. It is memorable in the Turkish wars of the latter half of the 17th century and for the Treaty of Buczacz in 1672 (*Ency. Brit.* xix. 295). It possesses the ruins of an old castle and a château belonging to the Potocki family. Population (1890), 11,096; (1900), 11,504 (Polish).

Buda (German, *Ofen*), formerly a royal free town of Hungary, on the right bank of the Danube, opposite Pest (on the left bank). It was incorporated with Pest in 1873. Since then the two towns, together with O-Buda (Alt-Ofen, the Aquincum of the Romans) and Steinbruch, form one municipality under the official name of Budapest.

Budapest, the capital of Hungary and residence of the king, situated on both banks of the Danube, 140 miles S.E. of Vienna. It is the seat of the government, parliament, and the supreme courts, and the headquarters of the commander of the Hungarian Landwehr or Houveds. The area, which is now 77½ square miles, has been but slightly increased since the incorporation of the two towns in 1873. Population (1880), including the garrison, 370,767; (1890), 506,384; (1900), 733,358, an increase in the decade of 44·82 per cent. as compared with 36·57 in the preceding ten years. Of this total, 427,112 were Roman Catholics and 5386 Catholics of the Greek rite; 166,198 Jews (in 1869, 42,000); 62,837 Protestants of the Helvetic and 37,170 of the Augsburg Confessions, and

3201 of the Greek orthodox faith. Between 1870 and 1900 the proportion of Roman Catholics declined from 72·3 to 60·7 per cent., of Jews rose from 16·6 to 23·6 per cent., and of Protestants from 10·1 per cent to 14·2. Hungarian was given as the mother tongue of 559,965; 98,515 being returned as German and 24,091 as Slovaks, a branch of the same race as the Czechs of Austria. The remainder (20,877) was composed of Croatians, Servians, Rumanians, Russians, Greeks, Armenians, Gypsies, &c. The great increase of the Magyar element must not be regarded as of purely ethnographic significance. The adoption of a Hungarian name or of the Hungarian language as the mother-tongue is often a political confession of faith, sometimes due to the persuasive influence of official superiors. The Jewish contribution amounted to 35·4 per cent., which was still higher in previous years. Of the 733,358 inhabitants of Budapest in 1900, including the garrison of 16,000 men, 79·6 per cent. were Magyars, 14 per cent. Germans, and 3·4 per cent. Slovaks, the balance being made up of other nationalities. The proportion of Roman Catholics was 60·7 per cent. (in 1890, 64·7 per cent.), of Protestants of the Helvetic and Augsburg Confessions, 14·8 per cent. (in 1890, 13 per cent.), of Jews, 23·6 per cent. (in 1890, 21 per cent.), and of other creeds 1·5 per cent. Of the nationalities the Magyars have the largest increase, and of the creeds the Helvetic Confession. The Roman Catholics show the smallest proportional increase. The Germans and Slovaks have actually declined in number, the former by 17,058 and the latter by 3035 souls.

The marriage-rate, which averaged 7·2 per thousand in the 'seventies, rose to 8·6 in the 'eighties, and to 9·5 in the period 1891-96. In 1897 and 1898 it was 9·6 per thousand. Between 1874 and 1898 the mixed marriages increased from 15·8 per cent. to 24·7 per cent. of the total number. During the same period the birth-rate diminished from 44·5 to 32·6 per thousand. Of these 29 to 30 per cent. were illegitimate. The decline in the death-rate is one of the most striking features in the progress of Budapest, sinking from 43·4 per thousand in 1874 to 20·6 per thousand in 1900. In addition to the increased influx of persons in the prime of life, this is due largely to the improved water-supply and better sanitary conditions generally, including increased hospital accommodation.

The progress of education, the direction and development of which have been governed by the desire to promote Magyar national sentiment, has kept pace with that made in other departments of public life. An important achievement in this respect is the retention in Hungarian military academies of the young officers who were previously educated in Austria. In 1898 the Budapest University was attended by 5382 students (about 2000 in the 'eighties), and the Polytechnic by 1569 (about 1000 in the 'eighties). A further large increase of the attendance is to be anticipated from special measures latterly adopted with the object of keeping Hungarian students at home. The number who attend the Austrian universities, and especially that of Vienna, is already diminishing. A new addition to the educational institutions is the Oriental Academy, organized in 1899. Between 1870 and 1891 the proportion of children attending school more than doubled. The number of elementary schools has increased from 35 in 1861 to 157 in 1899, and that of intermediate schools from one in 1870 to 16 in 1899. The illiterates over six years of age, who formed 27·8 per cent. of the population in 1870, fell to 23·1 in 1881 and to 16·6 per cent. in 1891. This percentage is lowest among the Magyar and highest among the Slav inhabitants; lowest among the Jews and Protestants and highest among the Roman Catholics.

There are 18 political daily papers, of which 5 are in the German language. Out of a total (in 1898) of 413 periodicals, 327 were in Hungarian, 36 in German, the remainder consisting of polyglot and Slav publications, &c.

Of the eight theatres, two are subsidized by the State and one by the municipality. The performances are almost exclusively in Hungarian, the exceptions being the occasional appearance of French, Italian, and other foreign artists. Performances in German are under a popular taboo, which effectually excludes them from the theatres, although sometimes given in a music-hall, where they have more than once led to hostile demonstrations. Among the other institutions should be mentioned fourteen lodges of Freemasons. These are forbidden to associate or hold meetings in Austria.

The municipal administration, although on the whole fairly satisfactory, appears to be somewhat expensive. The communal debt is increasing. The total revenue, ordinary and extraordinary, rose from £686,699 in 1887 to £1,220,787 in 1896, and £1,447,460 in 1900. The estimated value of the estate and effects of the corporation, which includes a large and increasing amount of house and real property, rose from £6,183,000 in 1887 to £11,582,000 in 1898. The municipality owns a great deal of the vacant land in and about the town.

The trade of Budapest is mainly in corn, wool, wine, spirits, cattle, pigs, horses, hides, wood, coal, &c. The principal industries are steam flour-milling, distilling, and the manufacture of machinery, waggons, bricks, jute, &c. Comprehensive statistics of the trade and industry of Budapest alone are not available; but, as the leading industrial centre and chief market of Hungary, there is a constant ratio between its progress and that of the whole country.

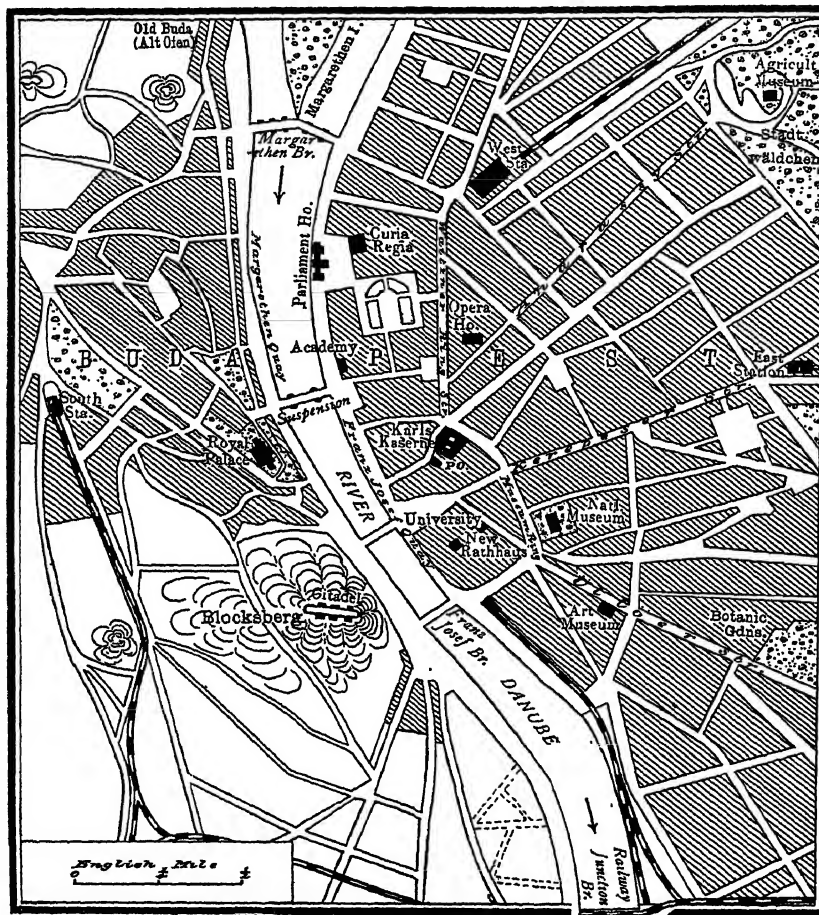

As an indication of that progress in both respects may be mentioned the increase in the period 1887-98 of the amount paid in direct and indirect taxation from, in round numbers, £1,200,000 to £2,187,666, with a corresponding increase in the communal surtax. The increase in the number of joint-stock companies and of the capital thus invested (an increase which greatly exceeds that of Vienna) is also a valuable indication. In 1873 there were 28 such companies, with a total capital of £2,224,900; in 1890, 75 (capital, £9,852,000); and in 1899 no less than 242, with a total capital of £31,378,655. In the latter year the average net profits of these companies was 8.5 per cent. One of the earliest material causes of the progress of Budapest—at first chiefly commercial—was the introduction of steam navigation on the Danube, which gave an immense impetus to its corn trade. This still continues to operate, having been promoted by the growth of the flour-milling industry, which was revolutionized by certain Budapest inventions. According to Mr A. Shaw, Minneapolis and Budapest are now the two great milling centres of the world. The latter possesses a number of magnificent establishments, fitted with automatic machinery invented and manufactured in the city; fifteen large steam-mills employ 3200 hands. A significant example of the progress of Budapest in another direction, the manufacture of electrical plant, is the fact that a Budapest firm was entrusted by the Russian Government (November 1899) with the erection of a great central station for the transmission of electric power at Port Arthur, and also contracted to furnish large and important plant for the Paris electrical underground railway, and an electric-lighting company in the French capital on the eve of the great exhibition of 1900.

Of the later improvements in Budapest perhaps the most important is the regulation of the older part of the town in connexion with the construction of the two new bridges across the Danube (there are now six in all), and the rapid development of Buda, where entirely new quarters have sprung up. The following figures will give an idea of the building activity: in 1881 the number of houses was 10,748; in 1891, 13,066; in 1896, 14,628; in 1901, 16,254. This growth, which was accompanied by a progressive increase in the proportion of the larger houses, is insufficient for the requirements of the population, of whom 13 per cent. still occupy overcrowded dwellings. The rapid development of a

quarter, consisting largely of palatial buildings, which has grown up in the vicinity of the new central railway station has won for it the popular appellation of "Chicago." In the period 1885-95 there were erected 221 new public buildings, including the Palace of Justice and the Royal Opera House, 11 other places of public amusement, 12 barracks, 10 bathing establishments, 9 larger educational institutions, 9 hospitals, 7 charitable institutions, 6 churches, 3 museums, 3 permanent exhibition buildings, 2 orphan asylums, and a central railway station. Within the same period there was a considerable addition to the number of public monuments by native artists. Rents bear nearly the same burden of taxation in Budapest as in Vienna, and in both towns the remission of taxes for a period of years is the chief means of promoting building and reconstruction by private persons. There has been a great extension of the tramway service (formerly horse traction, now electrical), and the new electric underground railway is one of the

best-constructed lines of the kind in existence.

The extraordinarily rapid growth of Budapest during the 19th century, and more particularly since 1867, together with its remarkable progress in every department of municipal and public life, renders it one of the most interesting of modern cities. In the matter of the increase of its population alone it has only been slightly surpassed by one European town, namely, Berlin. Both capitals multiplied their population by nine in the first nine decades of the century. According to an interesting and instructive comparison of the growth of twenty-eight European cities made by Dr Joseph de Körösy, director of the Budapest Communal Bureau of Statistics, Berlin in 1890 showed an increase, as compared with the beginning

PLAN OF BUDAPEST.

of the century, of 818 per cent., and Budapest of 809 per cent. Within the same period the increase of Paris was 343 per cent., and of London 340 per cent. This phenomenon, which has excited the admiration of an exceptionally competent American observer, Mr Albert Shaw (see "Budapest: the Rise of a New Metropolis," in his *Municipal Government in Continental Europe*), is worthy of special attention. In Mr Shaw's opinion no other important European city falls so far short of the appreciation it merits. There can be no doubt that its progress is mainly due to the revival of Hungarian national spirit in the first half of the century, and to the energetic and systematic efforts of the Government and people of Hungary since the restoration of the constitution. So far as Hungary was concerned, Pesth in 1867 at once became the favoured rival of Vienna, with the important additional advantage that it had no such competitors within its own sphere as Vienna had in the Austrian provincial capitals. The political, intellectual, and social life of Hungary was centred

in Pesth, and had largely been so since 1848, when it became the seat of the legislature, as it was that of the Austrian central administration which followed the Revolution. The ideal of a prosperous, brilliant, and attractive Magyar capital, which would keep the nobles and the intellectual flower of the country at home, uniting them in the service of the Fatherland, had received a powerful impetus from Count Stephen Széchenyi, the great Hungarian reformer of the pre-Revolutionary period. His work, continued by patriotic and able successors, was now taken up as the common task of the Government and the nation, under the guidance of a Liberal aristocracy and gentry distinguished by exceptional political insight. The eminent Hungarian statesman, Count Julius Andrássy, bore a prominent part in this work.

From that time to the present day the record of the Hungarian capital has been one of uninterrupted advance, not merely in externals, such as the removal of slums, the reconstruction of the town, the development of communications, industry, and trade, and the erection of important public buildings, but also in the mental, moral, and physical elevation of the inhabitants; besides another important gain from the point of view of the Hungarian statesman, namely, the progressive increase and improvement of status of the Magyar element of the population. The promotion of the interests of the capital and the centralization of the public and commercial life of the country have—apart from the special acts devoted to that end—formed an integral part of the policy of the State since the restoration of the constitution. Budapest has profited largely by the encouragement of agriculture, trade, and industry, by the nationalization of the railways, which all radiate from Pesth, by the special rates and the zone system, by the development of inland navigation, and also by the neglect of similar measures in favour of Vienna in consequence of the discord prevailing in Austria. It would be difficult to over-estimate the beneficial effect of such direct Government action as the founding of the large State establishment at Budapest for the manufacture of locomotives and agricultural and other machinery, and of the encouragement given to native and foreign enterprise, to undertake the production of all articles consumed in the country. When it is remembered that the ideal both of the authorities and the people is the ultimate monopoly of the home market by Hungarian industry and trade, and the strengthening of the Magyar influence by centralization, it is easy to understand the progress of Budapest.

Politically, this ambitious and progressive capital is the creation of the Magyar upper classes. Commercially and industrially, it may be said to be the work of the Jews. The sound judgment of the former led them to welcome and appreciate the co-operation of the latter, who furnish an ingredient necessary in the composition of a modern State in which they themselves were lacking. Indeed, a readiness to assimilate foreign elements is characteristic of Magyar patriotism, which has, particularly within the last generation, made numerous and ardent converts among the other nationalities of Hungary, and—for national purposes—may be considered to have quite absorbed the Hungarian Jews. It has thus come to pass that there is no anti-Semitism in Budapest, although the Hebrew element is proportionately much larger (21 per cent. as compared with 9 per cent.) than it is in Vienna, the Mecca of the Jew-baiter.

A far larger number of Jews and Protestants are engaged in industry, commerce, and intellectual pursuits than the more numerous Catholics. Out of every 10,000 Jews, 3274 come under those three categories. The remainder are divided as follows: of no occupation,

including women and children, 5498 (a far higher proportion than the Catholics and Protestants); engaged in unskilled physical labour, 993 (about a third of the proportion of Catholics and Protestants); in transports and communications, 164 (between a third and half the proportion of Catholics and Protestants); soldiers, policemen, barbers, &c., 55 (about a fourth of the Catholic and an eighth of the Protestant proportion); and, finally, 16 Jews per 10,000 are engaged in some form of agricultural, horticultural, and vineyard labour, which is less than a third of the Catholic and about a ninth of the Protestant proportion. The money-lending institutions, as well as commerce of the town, particularly in corn, manufactures, jewellery, furniture, and clothing, are mainly in the hands of the Jews. The Protestants are to a great extent agriculturists, while they are also largely represented among the teachers, officials, and artisans.

A comparison of the statistics of 1870 with those of 1891 shows a steady increase in the proportion of Hungarians in all occupations, and a corresponding diminution in the proportion of Austrians and other foreigners. In 1891 the percentage of natives engaged in industry was 85·7 per cent. (+9·7 per cent.); in communications, 91·5 per cent. (+24·6 per cent.); in trade, 91·1 per cent. (+7·2 per cent.); in the professions and intellectual occupations, 91·3 per cent. (+8·5 per cent.). Even in unskilled physical labour the same change is visible, there being within the same period an increase of 16 per cent. in the number of natives employed (in 1891, 85·4 per cent.).

Among the most important events in the recent history of the city are the National Hungarian Exhibition, held there in 1885; its elevation to an equality with Vienna as a royal residence and capital on the occasion of the 25th anniversary of the sovereign's coronation as king of Hungary in June 1892, followed by the royal ordinance of November 1893, superseding Austrian court functionaries by Hungarians during the king's stay in Hungary; the imposing national demonstration of respect and the public funeral accorded to the Revolutionary hero Louis Kossuth in March and April 1894; and the Millennial Exhibition in 1896 in celebration of the thousandth anniversary of the foundation of the kingdom of Hungary.

The official publications of the Budapest Communal Bureau of Statistics have acquired a European repute for their completeness, and their fearless exposure of shortcomings has been an element in the progress of the town. Reference should also be made to separate works of the director of that institution, Dr JOSEPH DE KÖRÖSY, known in England for his discovery of the law of marital fertility, published by the Royal Society, and by his labours in the development of comparative international statistics. His *Statistique Internationale des grandes villes*, and *Bulletin annuel des finances des grandes villes*, give valuable comparative data. See also *Budapest, hygiène publique et culture*, by Dr GUSTAVE THIRRING, assistant director of the Communal Bureau of Statistics, and the *Statistisches Jahrbuch von Budapest*, by the same author; KAHN'S *Illustrated Guide to Budapest*; KRÜCKEN'S *Budapest in Wort und Bild*; the *Technischer Führer von Budapest*, published by the Hungarian Association of Engineers and Architects; and Mr A. SHAW'S work, cited above. (Æ. O'N.)

Budaun, a town and district of British India, in the Rohilkhand division of the North-West Provinces. The town is near the left bank of the river Sot. The population in 1891 was 35,372; the municipal income in 1897-98 was Rs.32,871. There are ruins of an immense fort and a very handsome mosque, formerly a Hindu temple. The American Methodist mission maintains several girls' schools, and there is a high school for boys.

The district of BUDAUN has an area of 2017 square miles. The population in 1891 was 925,598, being 418

persons per square mile. Classified according to religion, Hindus numbered 774,779; Mahomedans, 148,393; Christians, 2581, of whom 19 were Europeans; "others," 229. In 1901 the population was 1,024,888, showing an increase of 11 per cent. The land revenue and rates were Rs.13,03,767, the incidence of assessment being Rs.0:13:13 per acre; the number of police was 2680. Out of a total cultivated area in 1896-97 of 840,827 acres, 104,800 were irrigated, mainly from wells. There are 51 indigo factories, employing 3000 persons, with an out-turn valued at Rs.1,20,400. The district is crossed by two lines of the Oudh and Rohilkhand railway, with five stations. The chief centre of trade is Bilsī.

Buddhism.—Since the article on BUDDHISM in the ninth edition of this work was written (vol. iv. pp. 424-438) nearly the whole of the works composed in the earliest period of Buddhism have been edited in the original Pali, chiefly through the Pali Text Society. A few works of the second period have been edited in the original Pali or Sanskrit, and a number of books of later Buddhism have appeared in the various languages of Eastern Asia. To appreciate the additions thus made to our knowledge it is necessary to remember that the Buddha, like other Indian teachers of his period, taught by conversation only. A highly-educated man (according to the education current at the time), speaking constantly to men of similar education, he followed the literary habit of his day by embodying his doctrines in set phrases (*sūtras*), on which he enlarged, on different occasions, in different ways. Writing was then widely known. But the lack of suitable writing materials made any lengthy books impossible. Such *sūtras* were therefore the recognized form of preserving and communicating opinion. They were catch-words, as it were, *memoria technica*, which could be easily remembered, and would recall the fuller expositions that had been based upon them. In the Buddha's time the Brahmins had their *sūtras* in Sanskrit, already a dead language. He purposely put his into the ordinary conversational idiom of the day, that is to say, into Pali. When the Buddha died these sayings were collected together by his disciples into what they call the Four Nikāyas, or "collections." These cannot have reached their final form till about fifty or sixty years afterwards. Other sayings and verses, most of them ascribed, not to the Buddha, but to the disciples themselves, were put into a supplementary Nikāya. We know of slight additions made to this Nikāya as late as the time of Asoka, 3rd century B.C. And the developed doctrine, found in certain portions of it, shows that these are later than the four old Nikāyas. For a generation or two the books so put together were handed down by memory, though probably written memoranda were also used. And they were doubtless accompanied from the first, as they were being taught, by a running commentary. About one hundred years after the Buddha's death there was a schism in the community. Each of the two schools kept an arrangement of the canon—still in Pali, or some allied dialect. Sanskrit was not used for any Buddhist works till long afterwards, and never used at all, so far as is known, for the canonical books. Each of these two schools broke up, in the following centuries, into others. Several of them had their different arrangements of the canonical books, differing also in minor details. These books remained the only authorities for about five centuries, but they all, except only our extant Pali Nikāyas, have been lost in India. These then are our authorities for the earliest period of Buddhism. Now what are these books?

We talk necessarily of Pali *books*. They are not books in the modern sense. They are memorial sentences or

verses intended to be learnt by heart. And the whole style and method of arrangement is entirely subordinated to this primary necessity. Each *sūtra* (Pali, *sutta*) is very short; usually occupying only a page, or perhaps two, and containing a single proposition. When several of these, almost always those that contain propositions of a similar kind, are collected together in the framework of one dialogue, it is called a *suttanta*. The usual length of such a *suttanta* is about a dozen pages; only a few of them are longer. And a collection of such *suttantas* might be called a book. But it is as yet neither narrative nor essay. It is at most a string of passages, drawn up in similar form to assist the memory, and intended, not to be read, but to be learnt by heart. The first of the four Nikāyas is a collection of the longest of these *suttantas*, and it is called accordingly the *Dīgha Nikāya*, that is "the Collection of Long Ones" (scil. *Suttantas*). The next is the *Majjhima Nikāya*, the "Collection of the *suttantas* of Medium Length"—medium, that is, as being shorter than the *suttantas* in the *Dīgha*, and longer than the ordinary *suttas* preserved in the two following collections. Between them these first two collections contain 186 dialogues, in which the Buddha, or in a few cases one of his leading disciples, is represented as engaged in conversation on some one of the religious, or philosophic, or ethical points in that system which we now call Buddhism. In depth of philosophic insight, in the method of Socratic questioning often adopted, in the earnest and elevated tone of the whole, in the evidence they afford of the most cultured thought of the day, these dialogues constantly remind the reader of the dialogues of Plato. But not in style. They have indeed a style of their own; always dignified, and occasionally rising into eloquence. But for the reasons already given, it is entirely different from the style of Western writings which are always intended to be read. Historical scholars will, however, revere this collection of dialogues as one of the most priceless of the treasures of antiquity still preserved to us. It is to it, above all, that we shall always have to go for our knowledge of the most ancient Buddhism. Of the 186, 144 have now been edited for the Pali Text Society, and the remainder are either in the press or in preparation. The present writer has commenced a translation of them into English, entitled "The Dialogues of the Buddha," of which one volume has appeared. And Dr K. E. Neumann has published the first volume of a translation of the shorter collection into German, under the title "Reden des Gotamo." A disadvantage of the arrangement in dialogues, more especially as they follow one another according to length and not according to subject, is that it is not easy to find the statement of doctrine on any particular point which is interesting one at the moment. It is very likely just this consideration which led to the compilation of the two following Nikāyas. In the first of these, called the *Anguttara Nikāya*, all those points of Buddhist doctrine capable of expression in classes are set out in order. This practically includes most of the psychology and ethics of Buddhism. For it is a distinguishing mark of the dialogues themselves that the results arrived at are arranged in carefully systematized groups. We are familiar enough in the West with similar classifications, summed up in such expressions as the Seven Deadly Sins, the Ten Commandments, the Thirty-nine Articles, the Four Cardinal Virtues, the Seven Sacraments, and a host of others. These numbered lists (it is true) are going out of fashion. The aid which they afford to memory is no longer required in an age in which books of reference abound. It was precisely as a help to memory that they were found so useful in the early Buddhist times, when the books were all learnt by heart, and had never as yet

been written. And in the Anguttara we find set out in order first of all the ones, then all the pairs, then all the trios, and so on up to the thirty-four constituent parts of the human organism, or the thirty-seven constituent elements of Arahatsip. It is the longest book in the Buddhist Bible, and fills 1840 pages 8vo. The whole of the Pali text has been published by the Pali Text Society, but only a few fragments of it have as yet been translated into English. The next, and last, of these four collections contains again the whole, or nearly the whole, of the Buddhist doctrine; but arranged this time in order of subjects. It consists of 55 *Samyuttas* or groups. In each of these the suttas on the same subject, or in one or two cases the suttas addressed to the same sort of people, are grouped together. The whole of it has been published in five volumes by the Pali Text Society. Only a few fragments have been translated.

Many hundreds of the short suttas and verses in these two collections are found, word for word, in the dialogues. And there are numerous instances of the introductory story stating how, and when, and to whom the sutta was enunciated—a sort of narrative framework in which the sutta is set—recurring also. This is very suggestive as to the way in which the earliest Buddhist records were gradually built up. The suttas came first embodying, in set phrases, the doctrine that had to be handed down. Those episodes, found in two or three different places, and always embodying several suttas, came next. Then several of these were woven together to form a *suttanta*. And finally the *suttantas* were grouped together into the two *Nikāyas*, and the suttas and episodes separately into the two others. Parallel with this evolution, so to say, of the suttas, the short statements of doctrine, in prose, ran the treatment of the verses. There was a great love of poetry in the communities in which Buddhism arose. Verses were helpful to the memory. And they were adopted not only for this reason. The adherents of the new view of life found pleasure in putting into appropriate verse the feelings of enthusiasm and of ecstasy which the reforming doctrines inspired. When particularly happy in literary finish, or peculiarly rich in religious feeling, such verses were not lost. These were handed on, from mouth to mouth, in the small companies of the brethren or sisters. The oldest verses are all lyrics, expressions either of emotion, or of some deep saying, some pregnant thought. Very few of them have been preserved alone. And even then they are so difficult to understand, so much like puzzles, that they were probably accompanied from the first by a sort of comment in prose, stating when, and why, and by whom they were supposed to have been uttered. As a general rule such a framework in prose is actually preserved in the old Buddhist literature. It is only in the very latest books included in the canon that the narrative part is also regularly in verse, so that a whole work consists of a collection of ballads. The last step, that of combining such ballads into one long epic poem, was not taken till after the canon was closed. The whole process, from the simple anecdote in mixed prose and verse, the so-called *akhyāna*, to the complete epic, comes out with striking clearness in the history of the Buddhist canon. It is typical, one may notice in passing, of the evolution of the epic elsewhere; in Iceland, for instance, in Persia, and in Greece. And we may safely draw the conclusion that if the great Indian epics, the *Mahā-bhārata* and the *Rāmāyana*, had been in existence when the formation of the Buddhist canon began, the course of its development would have been very different from what it was.

As will easily be understood, the same reasons which led to literary activity of this kind, in the earliest period,

continued to hold good afterwards. A number of such efforts, after the *Nikāyas* had been closed, were included in a supplementary *Nikāya* called the *Khuddaka Nikāya*. It will throw very useful light upon the intellectual level in the Buddhist community just after the earliest period, and upon literary life in the valley of the Ganges in the 4th or 5th century B.C., if we briefly explain what the tractates in this collection contain. The first, the *Khuddaka Pāṭha*, is a little tract of only a few pages. After a profession of faith in the Buddha, the doctrine and the order, there follows a paragraph setting out the thirty-four constituents of the human body—bones, blood, nerves, and so on—strangely incongruous with what follows. For that is simply a few of the most beautiful poems to be found in the Buddhist scriptures. There is no apparent reason, except their exquisite versification, why these particular pieces should have been here brought together. It is most probable that this tiny volume was simply a sort of first lesson book for young neophytes when they joined the order. In any case that is one of the uses to which it is put at present. The next book is the *Dhammapada*. Here are brought together from ten to twenty stanzas on each of twenty-six selected points of Buddhist self-training or ethics. There are here altogether 423 verses, gathered from various older sources, and strung together without any other internal connexion than that they relate more or less to the same subject. And the collector has not thought it necessary to choose stanzas written in the same metre, or in the same number of lines. We know that the early Christians were accustomed to sing hymns, both in their homes and on the occasions of their meeting together. These hymns are now irretrievably lost. Had some one made a collection of about twenty isolated stanzas, chosen from these hymns, on each of about twenty subjects—such as Faith, Hope, Love, the Converted Man, Times of Trouble, Quiet Days, the Saviour, the Tree of Life, the Sweet Name, the Dove, the King, the Land of Peace, the Joy Unspeakable—we should have a Christian *Dhammapada*; and very precious such a collection would be. The Buddhist *Dhammapada* has been edited by Professor Fausbøll (2nd edition, 1900), and has been frequently translated. Where the verses deal with those ideas that are common to Christians and Buddhists, the versions are easily intelligible, and some of the stanzas appeal very strongly to the Western sense of religious beauty. Where the stanzas are full of the technical terms of the Buddhist system of self-culture and self-control, it is often impossible, without expansions that spoil the poetry, or learned notes that distract the attention, to convey the full sense of the original. In all these distinctively Buddhist verses the existing translations (of which Professor Max Müller's is the best known, and Dr Karl Neumann's the best) are inadequate and sometimes quite erroneous. The connexion in which they were spoken is often apparent in the more ancient books from which these verses have been taken, and has been preserved in the commentary on the work itself.

In the next little work the framework, the whole paraphernalia of the ancient *akhyāna*, is included in the work itself, which is called *Udāna*, or "ecstatic utterances." The Buddha is represented, on various occasions during his long career, to have been so much moved by some event, or speech, or action, that he gave vent, as it were, to his pent-up feelings in a short, ecstatic utterance, couched, for the most part, in one or two lines of poetry. These outbursts, very terse and enigmatic, are charged with religious emotion, and turn often on some subtle point of Arahatsip, that is, of the Buddhist ideal of life. The original text has been published by the Pali Text Society. But the little book, a garland of fifty of these

gems, has not yet been translated. The next work is called the *Iti Vuttaka*. This contains 120 short passages, each of them leading up to a terse deep saying of the Buddha's, and introduced, in each case, with the words *Iti vuttam Bhagavatā*—"thus was it spoken by the Exalted One." These anecdotes may or may not be historically accurate. It is quite possible that the memory of the early disciples, highly trained as it was, enabled them to preserve a substantially true record of some of these speeches, and of the circumstances in which they were uttered. Some or all of them may also have been invented. In either case they are excellent evidence of the sort of questions on which discussions among the earliest Buddhists must have turned. These ecstatic utterances and deep sayings are attributed to the Buddha himself, and accompanied by the prose framework. There has also been preserved a collection of stanzas ascribed to his leading followers. Of these 107 are brethren, and 73 sisters, in the order. The prose framework is in this case preserved only in the commentary, which also gives biographies of the authors. This work is called the *Therātheri-gāthā*.

Another interesting collection is the *Jātaka* book, a set of verses supposed to have been uttered by the Buddha in some of his previous births. These are really 550 of the folk-tales current in India when the canon was being formed, the only thing Buddhist about them being that the Buddha, in a previous birth, is identified in each case with the hero in the little story. Here again the prose is preserved only in the commentary. And it is a most fortunate chance that this—the oldest, the most complete, and the most authentic collection of folk-lore extant—has thus been preserved intact to the present day. Many of these stories and fables have wandered to Europe, and are found in mediæval homilies, poems, and story-books. A full account of this curious migration will be found in the introduction to the present writer's *Buddhist Birth Stories*, the first volume of a contemplated translation of the whole book, now being completed under the editorship of Professor Cowell at the Cambridge University Press. The last of these poetical works which it is necessary to mention is the *Sutta Nipatta*, containing fifty-five poems, all except the last merely short lyrics, many of great beauty. A very ancient commentary on the bulk of these poems has been included in the canon as a separate work. The poems themselves have been translated by Professor Fausbøll in the *Sacred Books of the East*. The above works are our authority for the philosophy and ethics of the earliest Buddhists. We have also a complete statement of the rules of the order in the *Vinaya*, edited, in five volumes, by Professor Oldenberg. Three volumes of translations of these rules, by him and by the present writer, have also appeared in the *Sacred Books of the East*.

There have also been added to the canonical books seven works on *Abhidhamma*, a more elaborate and more classified exposition of the Dhamma or doctrine as set out in the *Nikāyas*. All these works are later. Only one of them has been translated as yet, the so-called Dhamma Sangani. The introduction to this translation, published under the title of *Buddhist Psychology*, contains the fullest account that has yet appeared of the psychological conceptions on which Buddhist ethics are throughout based. The translator, Mrs Caroline Rhys Davids, estimates the date of this ancient manual for Buddhist students as the 4th century B.C.

So far the canon, almost all of which is now accessible to readers of Pali. But only seven volumes have so far been translated, and a good deal of work is still required before the harvest of historical data contained in these texts shall have been made acceptable to students of philosophy and

sociology. These works of the oldest period, the two centuries and a half, between the Buddha's time and that of Asoka, were followed by a voluminous literature in the following periods—from Asoka to Kanishka, and from Kanishka to Buddhaghosa,—each of about three centuries. Many of these works are extant in MS.; but only five or six of the more important have so far been published. Of these the most interesting is the *Milinda*, one of the earliest historical novels preserved to us. It is mainly religious and philosophical, and purports to give the discussion, extending over several days, in which a Buddhist elder named Nāgasena succeeds in converting Milinda, that is Menander, the famous Greek king of Bactria, to Buddhism. The Pali text has been edited and the work translated into English. More important historically, though greatly inferior in style and ability, is the *Mahāvastu* or *Sublime Story*, in Sanskrit. The story is the one of chief importance to the Buddhists—the story, namely, of how the Buddha won, under the Bo Tree, the victory over ignorance, and attained to the Sambodhi, "the higher wisdom," of Nirvāna. The story begins with his previous births, in which also he was accumulating the Buddha qualities. And as the *Mahāvastu* was a standard work of a particular sect, or rather school, called the *Mahā-sāṅghikas*, it has thus preserved for us the theory of the Buddha as held outside the followers of the canon, by those whose views developed, in after centuries, into the *Mahāyāna* or modern form of Buddhism in India. But this book, like all the ancient books, was composed, not in the north, in Nepal, but in the valley of the Ganges, and it is partly in prose, partly in verse. Two other works, the *Laṭita Vistara* and the *Buddha Carita*, give us—but this, of course, is later—Sanskrit poems, epics, on the same subject. Of these, the former may be as old as the century before Christ; the latter belongs to the century after Christ. Both of them have been edited and translated. The older one contains still a good deal of prose, the gist of it being often repeated in the verses. The later one is entirely in verse, and shows off the author's mastery of the artificial rules of prosody and poetics, according to which a poem, a *mahākāvya*, ought, according to the later writers on the *Arts poetica*, to be composed.

These three works deal only quite briefly and incidentally with any point of Buddhism outside of the Buddha legend. Of greater importance for the history of Buddhism are two later works, the *Netti Pakarana* and the *Saddharma Pundarikā*. The former, in Pali, discusses a number of questions then of importance in the Buddhist community; and it relies throughout, as does the *Milinda*, on the canonical works, which it quotes largely. The latter, in Sanskrit, is the earliest exposition we have of the later *Mahāyāna* doctrine. Both these books may be dated in the 2nd or 3rd century of our era. The latter has been translated into English. We have now also the text of the *Prajñā Pāramitā*, a later treatise on the *Mahāyāna* system, which in time entirely replaced in India the original doctrines. To about the same age belongs also the *Divyāvadāna*, a collection of legends about the leading disciples of the Buddha, and important members of the order, through the subsequent three centuries. These legends are, however, of different dates, and in spite of the comparatively late period at which it was put into its present form, it contains some very ancient fragments.

The whole of the above works were composed in the north of India; that is to say, either north or a few miles south of the Ganges. The record is at present full of gaps. But we can even now obtain a full and accurate idea of the earliest Buddhism, and are able to trace the main

lines of its development through the first eight or nine centuries of its career. The Pali Text Society is still publishing two volumes a year; and the Russian Academy has inaugurated a series to contain the most important of the Sanskrit works still buried in MS. We have also now accessible in Pali fourteen volumes of the commentaries of the great 5th-century scholars in south India and Ceylon, most of them the works either of Buddhaghosa of Buddh Gaya, or of Dhammapāla of Kāncipura (the ancient name of Conjevaram). These are full of important historical data on the social, as well as the religious, life of India during the periods of which they treat.

The striking archæological discoveries of the last few years have both confirmed and added to our knowledge of the earliest period. Pre-eminent among these is the discovery, by Mr William Peppé, on the Birdpur estate, adjoining the boundary between English and Nepalese territory, of the stūpa, or cairn, erected by the Sakya clan over their share of the ashes from the cremation pyre of the Buddha. About twelve miles to the north-east of this spot has been found an inscribed pillar, put up by Asoka as a record of his visit to the Lumbini Garden, as the place where the future Buddha had been born. Although more than two centuries later than the event to which it refers, this inscription is good evidence of the site of the garden. There had been no interruption of the tradition; and it is probable that the place was then still occupied by the descendants of the possessors in the Buddha's time. North-west of this another Asoka pillar has been discovered, recording his visit to the cairn erected by the Sakyas over the remains of Konāgamana, one of the previous Buddhas or teachers, whose follower Gotama the Buddha had claimed to be. These discoveries definitely determine the district occupied by the Sakya republic in the 6th and 7th centuries B.C. The boundaries, of course, are not known; but the clan must have spread thirty miles or more along the lower slopes of the Himalayas, and thirty miles or more southwards over the plains. It has been abandoned jungle since the 3rd century A.D., or perhaps earlier, so that the ruined sites, numerous through the whole district, have remained undisturbed, and further discoveries may be confidently expected.

The principal points on which this large number of older and better authorities has modified our knowledge are as follows:—1. We have learnt that the division of Buddhism, originating with Burnouf, into northern and southern, is misleading. He found that the Buddhism in his Pali MSS., which came from Ceylon, differed from that in his Sanskrit MSS. which came from Nepal. Now that the works he used have been made accessible in printed editions, we find that, wherever the existing MSS. came from, the original works themselves were all composed in the same stretch of country, that is, in the valley of the Ganges. The difference of the opinions expressed in the MSS. is due, not to the place where they are now found, but to the difference of time at which they were originally composed. Not one of the books mentioned above is either northern or southern. They all claim, and rightly claim, to belong, so far as their place of origin is concerned, to the Majjhima Desa, the middle country. It is undesirable to base the main division of our subject on an adventitious circumstance, and especially so when the nomenclature thus introduced (it is not found in the books themselves) cuts right across the true line of division. The use of the terms northern and southern as applied, not to the existing MSS., but to the original books, or to the Buddhism they teach, not only does not help us, it is the source of serious misunderstanding. It inevitably leads careless writers to take for granted that we have, historically, two Buddhisms—one manufactured in Ceylon,

the other in Nepal. Now this is admittedly wrong. What we have to consider is Buddhism varying through slight degrees, as the centuries pass by, in almost every book. We may call it one, or we may call it many. What is quite certain is that it is not two. And the most useful distinction to emphasize is, not the ambiguous and misleading geographical one—derived from the places where the modern copies of the MSS. are found; nor even, though that would be better, the linguistic one—but the chronological one. The use, therefore, of the inaccurate and misleading terms northern and southern ought no longer to be followed in scholarly works on Buddhism.

2. Our ideas as to the social conditions that prevailed, during the Buddha's lifetime, in the eastern valley of the Ganges have been modified. The people were divided into clans, many of them governed as republics, more or less aristocratic. In a few cases several of such republics had formed confederations, and in four cases such confederations had already become hereditary monarchies. The right historical analogy is not the state of Germany in the Middle Ages, but the state of Greece in the time of Socrates. The Sakyas were still a republic. They had republics for their neighbours on the east and south, but on the western boundary was the kingdom of Kosala, the modern Oudh, which they acknowledged as a suzerain power. Gotama, the Buddha's father, was not a king. There were rājas in the clan, but the word meant at most something like consul or archon. All the four real kings were called Mahā-rāja. And Suddhodana, the teacher's father, was not even rāja. One of his cousins, named Bhaddiya, is styled a rāja; but Suddhodana is spoken of, like other citizens, as Suddhodana the Sakyan. As the ancient books are very particular on this question of titles, this is decisive.

3. There was no caste—no caste, that is, in the modern sense of the term. We have long known that the connubium was the cause of a long and determined struggle between the patricians and the plebeians in Rome. Evidence has been yearly accumulating on the existence of restrictions as to intermarriage, and as to the right of eating together (commensality) among other Aryan tribes, Greeks, Germans, Russians, and so on. Even without the fact of the existence now of such restrictions among the modern successors of the ancient Aryans in India, it would have been probable that they also were addicted to similar customs. It is certain that the notion of such usages was familiar enough to some at least of the tribes that preceded the Aryans in India. Rules of endogamy and exogamy; privileges, restricted to certain classes, of eating together, are not only Indian or Aryan, but world-wide phenomena. Both the spirit, and to a large degree the actual details, of modern Indian caste-usages are identical with these ancient, and no doubt universal, customs. It is in them that we have the key to the origin of caste.

At any moment in the history of a nation such customs seem, to a superficial observer, to be fixed and immutable. As a matter of fact they are never quite the same in successive centuries, or even generations. The numerous and complicated details which we sum up under the convenient, but often misleading, single name of caste are solely dependent for their sanction on public opinion. That opinion seems stable. But it is always tending to vary as to the degree of importance attached to some particular one of the details, as to the size and complexity of the particular groups in which each detail ought to be observed.

Owing to the fact that the particular group that in India worked its way to the top, based its claims on religious grounds, not on political power, nor on wealth, the system has, no doubt, lasted longer in India than in Europe. But public opinion still insists, in considerable

circles, even in Europe, on restrictions of a more or less defined kind, both as to marriage and as to eating together. And in India the problem still remains to trace, in the literature, the gradual growth of the system—the gradual formation of new sections among the people, the gradual extension of the institution to the families of people engaged in certain trades, belonging to the same group, or sect, or tribe, tracing their ancestry, whether rightly or wrongly, to the same source. All these factors, and others besides, are real factors. But they are phases of the extension and growth, not explanations of the origin of the system.

There is no evidence to show that at the time of the rise of Buddhism there was any substantial difference, as regards the barriers in question, between the peoples dwelling in the valley of the Ganges and their contemporaries, Greek or Roman, dwelling on the shores of the Mediterranean Sea. The point of greatest weight in the establishment of the subsequent development, the supremacy in India of the priests, was still being hotly debated. All the new evidence tends to show that the struggle was being decided rather against than for the Brahmins. What we find in the Buddha's time is caste in the making. The great mass of the people were distinguished quite roughly into four classes, social strata, of which the boundary lines were vague and uncertain. At one end of the scale were certain outlying tribes and certain hereditary crafts of a dirty or despised kind. At the other end the nobles claimed the superiority. But Brahmins by birth (not necessarily sacrificial priests, for they followed all sorts of occupations) were trying to oust the nobles from the highest grade. They only succeeded, long afterwards, when the power of Buddhism had declined.

4. It had been supposed on the authority of late priestly texts, where boasts of persecution are put forth, that the cause of the decline of Buddhism in India had been Brahmin persecution. The now accessible older authorities, with one doubtful exception,¹ make no mention of persecution. On the other hand, the comparison we are now able to make between the canonical books of the older Buddhism and the later texts of the following centuries, shows a continual decline from the old standpoint, a continual approximation of the Buddhist views to those of the other philosophies and religions of India. We can see now that the very event which seemed, in the eyes of the world, to be the most striking proof of the success of the new movement, the conversion and strenuous support, in the 3rd century B.C., of Asoka, the most powerful ruler India had had, only hastened the decline. The adhesion of large numbers of nominal converts, more especially from the newly incorporated and less advanced provinces, produced weakness rather than strength in the movement for reform. The day of compromise had come. Every relaxation of the old thoroughgoing position was welcomed and supported by converts only half converted. And so the margin of difference between the Buddhists and their opponents gradually faded almost entirely away. The soul theory, step by step, gained again the upper hand. The popular gods and the popular superstitions are once more favoured by Buddhists themselves. The philosophical basis of the old ethics is overshadowed by new speculations. And even the old ideal of life, the salvation of the Arahats to be won in this world and in this world only, by self-culture and self-mastery, is forgotten, or mentioned only to be condemned. The end was inevitable. The need of a separate organization became less and less apparent. The whole pantheon of the Vedic gods, with the ceremonies and the sacrifices associated with them, passed indeed away. But the ancient Buddhism, the party of reform, was over-

whelmed also in its fall; and modern Hinduism arose on the ruins of both.

The attention of the few scholars at work on the subject being directed to the necessary first step of publishing the ancient authorities, the work of exploring them, of analysing and classifying the data they contain, has as yet been very imperfectly done. But the following works have appeared, and are to be preferred to those given at the end of the article in the ninth edition. Only the most important are here mentioned.

Texts.—*Pali Text Society*, 50 vols.—*Jātaka*, 7 vols., ed. FAUSBÖLL, 1877-97.—*Vinaya*, 5 vols., ed. OLDENBERG, 1879-83.—*Dhammapada*, ed. FAUSBÖLL, 2nd ed. 1900.—*Dīvydvāda*, ed. (T. W. R. D.)

Budweis (Czech, *Budějovice*), the chief town of a government-district in Bohemia, Austria. Population (1890), 28,491; (1900), 39,328 (estimated to have 59 per cent. Czech, 41 per cent. German, 95.5 per cent. Catholic, 4 per cent. Jewish, and $\frac{1}{2}$ per cent. Protestant). It has a garrison of 2155 men. It is the principal commercial centre of South Bohemia, and has a large, varied, and growing industry, which now comprises the manufacture of chemicals, matches, paper, machinery, bricks and tiles, boat-building, bell-founding, corn and sawmills, &c. The trade is chiefly in corn, timber, coal, lignite, and salt, as well as in industrial products, including beer exported to America. Budweis is the centre of a German enclave in Czech Bohemia, the rural population for a considerable distance round the town being German-speaking.

Buell, Don Carlos (1818-1898), American soldier, was born near Marietta, Ohio, on 23rd March 1818. He graduated at West Point in 1841, and during the Mexican war won brevet promotion, being severely wounded at Cherubusco. From 1848 to 1861 he performed various staff duties, chiefly as assistant-adjutant-general. Appointed lieutenant-colonel of staff on 11th May 1861, and brigadier-general of volunteers on 17th May 1861, he aided efficiently in organizing the army of the Potomac, and, at the instance of General McClellan, was sent in November to Kentucky to succeed General William T. Sherman in the reorganized department of the Ohio. Aided by Grant's famous river operations, he occupied Bowling Green in February 1862, and thence marched to Nashville. He was promoted major-general of volunteers on 21st March 1862, and placed at once under the orders of General Halleck, then at the zenith of his fame. Near the critical close of Grant's first day's battle at Shiloh he arrived with reinforcements, and co-operated in driving back the foe on the following day. Detached with his army by Halleck after the capture of Corinth, he met the rapid advance of the Confederate General Bragg into Kentucky, rescued Louisville, and, on 8th October, fought at Perryville, compelling Bragg to retreat. Complaints

¹ See *Journal of the Pali Text Society*, 1896, pp. 87-92.

against him having been made at Washington, which were later investigated but not published, Buell was now superseded by General Rosecrans. He was mustered out of the volunteer service in May 1864, and on 1st June resigned from the regular army. He was president of Kentucky ironworks (1865-70), and subsequently engaged in various mining enterprises; he served (1885-90) as pension agent at Louisville. He died near Rockport, Kentucky, on 19th November 1898. Buell was a good organizer of troops and disciplinarian, but somewhat tardy of movement and indisposed to take risks, and his haughty bearing often caused offence. As McClellan's friend, holding similar views, adverse politically to the administration, he suffered by McClellan's displacement.

Buenos Aires, a maritime province of the Argentine Republic. The official area at the census of 1895 was 117,777 square miles: the population in 1869 (exclusive of that of the Federal District) was 307,761; in 1895 it was 921,168. The capital is La Plata. In 1895 there were 36,777 farms, 2,774,875 acres planted in cereals, 7,745,896 head of cattle, 1,685,658 horses, and 11,545,018 sheep in the province.

Buenos Aires, capital of the Argentine Republic, situated in 34° 36' 29" S. lat. and 58° 22' 14" W. long.; its mean altitude above sea-level, 10 feet. It now forms part of the Federal District (area, 72 square miles; greatest breadth from N. to S., 11 miles; greatest length from E. to W., 16 miles), which was separated from the rest of the province in 1880, and constituted an administrative entity, when the city was made the federal capital and its duties as provincial capital were transferred to La Plata. All the most characteristic features of the old city have changed completely. The ancient one-storeyed buildings have been replaced by handsome structures of modern design; the streets have been paved with asphalt and wood; electric light has been introduced; water and drainage works have been constructed. In short, European civilization is now firmly implanted. The once outlying parts of the capital either have already become real suburbs or will shortly do so. Amongst later important public buildings and institutions are the Congress House, the Archbishop's Palace, the National Library (60,000 volumes), the National Museum of Fine Arts (1895), the Natural History Museum, the National Historical Museum, the Zoological Gardens, and the Municipal Botanical Gardens. The population in 1880 was estimated to be under 400,000; in 1895 it was 663,854, and in 1899, 795,323. The number of foreigners in 1895 was 345,493, as against 63,115 in 1869. The proportion of males to females per thousand at the same date was 537 males to 463 females. The number of marriages in 1895 was 5492, or 8.1 per thousand; of births in 1898, 40.9 per thousand; of deaths, 17.67 per thousand. At the same date the number of property owners was 45,848. As regards public instruction, the census of 1895 showed that of children from six to fourteen years of age 93,560 were attending school or knew how to read and write, out of a total of 117,388, or 719 to each 1000. Most of the immigration to the republic enters through Buenos Aires. In 1896, 102,000 entered; in 1898, 95,190; in 1899, 88,000, of whom 13,000 were agricultural families with 40,000 members. Buenos Aires is the head of six railway lines—the Southern, Pacific, Rosario, La Ensenada, Argentine Central, and Western. In 1898 these lines took, at the various stations within the municipality, 10,962,240 passengers and 2,346,946 tons of merchandise. The tramways at the end of 1898 extended over 246 miles, and carried 105,964,631 passengers. The post office received in 1887, 10,752,284

pieces of mail matter; in 1898, 53,175,579. In 1887, 11,243,017 pieces were despatched; in 1898, 61,374,446 pieces. The telegraphic bureau in 1898 received 707,812 telegrams and despatched 479,793. The commercial community is for the most part comprised of foreigners:—British and Germans in the higher branches of banking and finance; British, Spaniards, Germans, and Italians in the import and export trade; Italians, French, and Spaniards in the retail business. The value of the imports and exports of Buenos Aires from 1880 to 1898 is shown in the following table, the value being given in gold pesos:—

Year.	Imports.	Exports.
1880	\$37,095,243	\$39,887,302
1885	69,787,044	51,996,527
1890	103,175,961	57,742,342
1895	82,048,177	62,531,492
1898	92,206,491	70,956,559

The movement of shipping in 1887 and 1898 is shown in the subjoined table:—

	1887.				1898.			
	Sailing.		Steam.		Sailing.		Steam.	
	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.

Cleared	1325	398,744	1769	1,226,671	1987	352,401	2311	2,388,675

Buffalo, the second city in size in the state of New York and the eighth in the United States of America, situated at the foot of Lake Erie where the Niagara River begins its connecting course to Lake Ontario, and the Erie Canal, by its artificial channel, continues the water route to the sea-board. It is practically the midway point between Chicago and New York or Boston; the journey by rail from New York being somewhat over 400 miles, from Boston a little less than 500, and from Chicago a little more than 500 miles. Its position, practically in the centre of the thickly populated portion of the United States, and at the transfer point between the east and the west, accounts for the development of this city during the last twenty years of the 19th century. Shortly after 1880 the rapid growth began. In that year the population was 155,134; in 1890 it had attained to 255,664, and in 1900 it reached 352,387. The assessed valuation of real and personal property grew from \$38,000,000 in 1873 to nearly \$246,000,000 in 1900. The net debt in 1900 was \$15,753,582, and the tax rate \$23.48 per \$1000. It was in the decade from 1880 to 1890 that most of the great railway building was done which has made Buffalo a transportation centre of almost unrivalled facilities. There are thirty different railway divisions meeting in the city, and the railways own 6 of the city's total area of 42 square miles, and have over 500 miles of track within the city's limits. The trunk lines entering the city from the east are the New York Central, West Shore, Erie, Lackawanna, Lehigh, and Pennsylvania; from the west and south, the Lake Shore, Michigan Central, Nickel Plate, Grand Trunk, Wabash, and Canadian Pacific. In short, all the trunk lines of what may be called the northern route between the east and the west have made Buffalo a central distributing point. The commerce of the lakes has increased as rapidly as that of the railways. The vessels which arrived at the port of Buffalo in 1899 numbered over 5000, with a tonnage of over 5,000,000. The average annual receipts of grain and flour by the lakes in 1875 was 50,000,000 bushels; now it is over 200,000,000 bushels. The elevators, which even then were a famous and picturesque feature of Buffalo, now

have a storage capacity of over 21,000,000 bushels as against the 7,000,000 bushels of that time. The coal trade of Buffalo, which in 1875 was in its infancy, has now become a great feature of the lake commerce; for of the 5,000,000 tons of anthracite coal received in 1899, 2,700,000 tons were shipped to the west by vessel. 3,000,000 tons of bituminous coal were also received by rail in 1899, though only a small amount was shipped. The lumber imports by lake were 230,000,000 feet in 1899, and in the same year over 1,500,000 tons of iron ore were brought from Lake Superior to the port of Buffalo. For the protection of this lake commerce and the increase of the harbour facilities the United States has built an outer breakwater of stone and cement almost four miles in length, and costing over \$2,000,000. This breakwater and the new post-office, a huge granite pile with a tower over 200 feet in height, are the most noticeable of the newer public improvements. The two public libraries are also among the newer public buildings which decorate the city. The Grosvenor library, for reference only, has over 55,000 volumes, while the Buffalo library has 160,000 volumes. The public school system has grown with the growth of the city. In 1900 there were two high schools with an average attendance of 2228 scholars. The district or grammar schools numbered sixty, with an average attendance of 38,462. There were 114,396 persons of school age (5 to 20 years inclusive). Out of 97,938 males of voting age (21 years and over), 5168 were illiterate (unable to write), of whom 4813 were foreign-born. Buffalo has always been greatly admired for its broad and spacious streets, almost all of which are handsomely shaded. The streets in the residential portion are mainly occupied by detached houses, largely built of wood and surrounded by lawns and gardens. This system of building and a remarkably cool summer climate have given Buffalo its reputation as a delightful place of residence, and have attracted visitors from all parts of the world. In 1901 the Pan-American Exposition was held from May to November in the park and adjoining lands to the north of the city. It was on a scale eclipsed only by the Expositions at Chicago and Paris. Two of the buildings were permanent additions to the attractions of the park, namely, the Albright Art Gallery and the New York State building, which is to house the collections of the Buffalo Historical Society. It was during a visit to the Exposition on 6th September that President McKinley was assassinated by Czolgosz. At the south end of the city, on the lake shore protected by the new breakwater, stands the great steel plant of the Lackawanna Steel Company. The property owned by this company, which is capitalized at \$20,000,000, extends more than a mile along the shore and its new works are intended to employ over 6000 men. Much of the power used in Buffalo is from electricity generated at Niagara Falls, some 20 miles away, and most of the residences are heated by natural gas brought from the Canadian and Pennsylvania gas fields. The park system in Buffalo comprises 1000 acres and contains 20 miles of boulevards. Of the total population in 1900, 248,135 were native-born and 104,252 foreign-born, 350,586 white and only 1801 coloured, of whom 1698 were negroes. The healthfulness of the city is attested by its low death-rate of 14.8 per thousand in 1900. (G. E. M.)

Building.—The most important development in building since the article on that subject in the ninth edition of this work was published has been in the direction of steel construction, and it is with this that the following article will deal. The very tall buildings which are such prominent objects in the principal cities of the United States are the natural and logical result of the

introduction of new materials and devices, and of the application of modern science to the solution of the problem of economical construction (see Plate). Apart from the æsthetic considerations to which have been due the construction of spires, towers, domes, high roofs, &c., the form and height of buildings have always been largely controlled by a practical consideration of their value for personal use or rental. The cost of buildings of the same class and finish is in direct proportion to their cubic contents, and each cubic foot constructed is commercially unprofitable which does not do its part in paying interest on the capital invested. Until the latter half of the 19th century, these considerations practically limited the height of buildings on city streets to five or six storeys. The manufacture of the wrought-iron "I" beam in 1855 made cheaper fireproof construction possible, and together with the introduction of passenger lifts (see ELEVATORS) about ten years later led to the erection of buildings to be used as hotels, flats, offices, factories, and for other commercial purposes, containing many more storeys than had formerly been found profitable. The practical limit of height was reached when the sectional area of the masonry of the piers of the exterior walls in the lower storey became sufficiently great, in order to support safely the weight of the dead load of the walls and floors and the accidental load imposed upon the latter in use, to affect seriously the value of the lower storeys on account of the loss of light and floor space. This limit was found to be about ten storeys. Various devices were successively made to reduce the size of the exterior piers. In 1881 the walls of a very large courtyard were constructed by building a braced cage of iron and filling the panels with masonry, a system of construction which had been used in the early part of the century for a tall shot-tower erected in the city of New York. Subsequently several buildings were erected in which the entire weight of the floors and roofs was carried by a system of metal columns placed against the inner surface of the exterior walls. The walls thus supported no load but their own weight, and were tied to the inner cage formed by the wall columns, interior columns, girders, and floors, by anchors arranged to provide for the shrinkage of masonry in drying out which always occurs to a greater or less extent. By the use of this form of construction buildings were carried to the height of eighteen or nineteen storeys.

The first building used for tenants, in which the entire construction including the exterior walls was carried by a metal frame, was erected in Chicago in 1883. With the introduction of cheap structural steel, this system (known as the steel cage construction) came rapidly into use. The dimensions of the exterior piers ceased to control the height of the building, which was limited alone by the possibility of securing adequate foundations, and by a consideration of the amount of floor space which could be devoted without too great loss to a system of passenger lifts of sufficient capacity to afford rapid access to all parts of the building. The advantages that led to the very rapid introduction of this system were not only the power of greatly reducing the size of the piers, but the enormous facility afforded for rapid construction, the small amount of materials relatively used, and the proportionately small load upon the foundations, and the fact that as the walls are supported at each storey directly from the cage, the masonry can be commenced at any storey independently of the masonry below it. It is a disadvantage of the system that defects of proportion, material, or workmanship, which would be of less moment in an old-fashioned construction, may become an element of danger in building with the steel cage, while the possibility of securing a

PARK ROW BUILDING, NEW YORK.

QUEEN ANNE MANSIONS, LONDON.

AMERICAN AND EUROPEAN BUILDING—A CONTRAST

permanent protection of all parts of the cage from corrosion is a most serious consideration. The safety of the structure depends upon the preservation of the absolute integrity of the cage. It must not only be strong enough to sustain all possible vertical loads, but it must be sufficiently rigid to resist without deformation or weakening all lateral disturbing forces, the principal of which are the pressure of wind, the possible sway of moving crowds or moving machinery, and the vibration of the earth from the passage of loaded vans and trolleys and slight earthquakes which at times visit almost all localities. In buildings wide in proportion to their height it is the ordinary practice to make the floors sufficiently rigid to transfer the lateral strains to the walls, and to brace the wall framings to resist them. In buildings of small width in proportion to their height this method of securing rigidity is generally found to be inadequate, and the frame is also braced at right angles to the outer walls to take up the strains directly. In each case all strains are carefully computed. The bracing is accomplished by the introduction at the angles of the columns and girders or beams of gusset plates or knee braces, or by diagonal straps or rods properly attached by rivet or pin connexions. All portions of the frame are united by hot rivets of mild steel or wrought iron, care being taken that the sum of the sectional areas of rivets affords in each case a sufficient amount of metal for the safe transfer of the stresses. The greatest care should be taken to see that all rivet holes are accurately punched, and if necessary that they are reamed so that each rivet will have its full value.

It is evident that with this system of construction all serious inequality of settlement must be avoided, and unusual care, therefore, must be employed to secure perfect foundations. As a preliminary to the design of the foundations a knowledge of the character of the site for a considerable distance below the footings should be gained by borings, and in cases where a certain settlement must be expected the footings must be so proportioned that the pressure at their bottom on each square foot of surface of the soil shall be uniform, so that inequality of settlement may be prevented. Experience has shown that a very close approximation to this result may be secured by assuming in the case of residences, hotels, offices, and other buildings in which the principal variable load is that of men and women, that the load on each lower column base is the sum of the dead load of the weight of materials borne by it, and 20 per cent. of the variable loads which may be imposed upon the floor and roof surface it sustains. In the case of shops, factories, &c., increased percentages of the variable loads must be assumed to be borne by the lower column bases in proportion to the relative amounts of the variable loads which will be imposed upon the floors for any considerable length of time. The foundations must be spread below the column bases until such areas are reached that the pressure on the soil is not greater than its safe sustaining power. This is accomplished by rackings of stone or brickwork, or steppings of concrete, or systems of inverted arches, or systems of steel girders and cantilevers bearing on grillages of parallel steel "I" beams kept a uniform distance apart by separators, and bolted together by steel rods. The grillage beams rest upon and are embedded in concrete, and in many cases the girders and cantilevers are also embedded in concrete. The tables of grillage must be so arranged and proportioned that there is no serious eccentricity of loading from the columns. Shear and bending moment, as well as the absolute strength of all girders, cantilevers, and "I" beams, must be carefully computed. Before building on an elastic or yielding bottom the sustaining strength of the soil must be ascer-

tained. On the bottom is placed a table with a single leg of a recorded dimension arranged so that it can only move vertically. This is loaded upon the top with pig-iron or other material of known weight, and the pressure is noted under which initial compression of the soil takes place, and the load under which the settlement becomes marked. At this point the increase of load is stopped and the soil is allowed to remain under pressure for several days, careful observations being taken at regular intervals of the rate of settlement until no further settlement occurs. A foundation which will not settle may be secured:—

(a) By spreading the footings until the pressure on the bottom is less than the load at which the initial settlement occurred, which will be found to vary from $1\frac{1}{2}$ short tons per foot for ordinary wet clay or earth, to 3 or 5 tons per foot for retained sand or hard pan; (b) by building on piles driven to refusal (that is, until they will not move under the repeated blows of a heavy pile-driving hammer), in which case they must not be loaded beyond their safe computed strength as columns with free ends; pile foundations should never be used unless the circumstances are such as to ensure that they with their cappings will be constantly covered with water; (c) by excavating to bed-rock and laying foundations upon it. Where the rock is covered by dry earth or gravel this can be accomplished without particular difficulty by careful sheath-piling to retain the sides of the excavation, but where the covering is quicksand or swamp-mud pneumatic caissons must be sunk. A pneumatic caisson is a round or polygonal shell of wood or metal open at the bottom, which is called the "cutting edge," about 6 feet above which is built a removable roof, which forms an air-tight chamber. This chamber is entered through the roof by a metal cylinder about 3 feet in diameter, which extends to the top of the caisson, and is called the "air-shaft." On the top of this air-shaft is bolted a cylinder of greater diameter, provided with doors at its top and bottom, which is called the "air-lock." Air is supplied through pipes to the air-chamber, and constantly maintained at a sufficient pressure to keep water from entering the air-chamber, and to expel it from the ground immediately below it. The exterior of the caisson is made very smooth, and is thoroughly lubricated. The caisson is sufficiently loaded to cause it to sink as the material within it is excavated and removed. Access to or from the caisson for both men and materials is gained without altering the air-pressure in the caisson, by opening and closing the doors of the air-lock successively. When the sound bottom is reached it is faced off to secure a good bearing, and concrete is introduced through the air-locks and bedded in the bottom of the caisson to a sufficient depth to form a water seal. The air-locks, air-shaft, and roof are then removed from the top of the caisson, and an open well remains in which the building may be extended with appropriate materials to the concrete foundations at the bottom. No reliance is placed upon the strength of the caissons as a direct support to the building. A well-constructed and carefully-handled caisson, in which a proper air-pressure is maintained without interruption, may be sunk through flowing quicksand or mud in close proximity to the foundations of an adjoining building standing on the crust above the soft bottom, without injury to it. Until very lately it has been assumed that a depth of 110 feet below the water-level was the practical limit to which caissons could be sunk, for men cannot safely work in an air-pressure of more than about 50 pounds to the square inch, but it is now found that they can be safely sunk to a considerably greater depth, for recent experience has shown that the exterior water-pressure at the base of a caisson is in

inverse proportion to the resistance to the flow of water through the material in which the caisson is sunk, and that the air-pressure which it is necessary to maintain in the air-chamber, to expel the water and dry the bottom, is always much less than, and frequently not more than 33 per cent. of, the pressure due to the column of water equal in height to the depth of immersion of the cutting edge.

In transferring the loads from the column bases to the bottom of the footings the greatest care must be taken

Columns. in all systems of construction that the stresses throughout at no point exceed the safe limits of stress for the various materials used. Steel is generally used for columns in preference to cast iron, because it affords greater facility for securing satisfactory connexions, because its defects of quality or workmanship are more surely detected by careful test and inspection, and because, on account of its superior elasticity and ductility, its fibre is less liable to fracture from slight deformations. It is used in preference to wrought iron on account of its lesser cost. Columns are generally built of riveted work of zeebars, channels, angles, plates, or lattice, of such form as will make the simplest and most easily constructed framing in the particular position in which the column is placed. The columns are sometimes run through two or more storeys and arranged to break joints at the different floors. In buildings to be used as offices, hotels, apartments, &c., it is usual in establishing the loads for the purpose of computation to assume that the columns carrying the roof and the upper storey will be called upon to sustain the full dead load due to material and the maximum computed variable load, but it is customary to reduce the variable loads at the rate of about 5 per cent. storey by storey towards the base, until a minimum of about 20 per cent. of the entire variable load is reached, for it is evidently impossible that the building can be loaded by a densely packed moving crowd in all of its storeys simultaneously. In the case of factories and buildings used for storage purposes the maximum variable load which can be imposed for any serious length of time on each floor must be used without reduction in computing the loads of the lower column, and proper allowances must be made for vibrating loads. In the case of very tall exposed buildings of small depth, the vertical load on the columns due to wind-pressure on the opposite side of the building must be computed and allowed for, and in case the lower columns are without lateral support their bending moment must be sufficient to resist the lateral pressure due to wind and eccentricity of loading. In computing the column sections a proper allowance must be made for any eccentricity of loading. It is usual to limit the height of sections of columns without lateral support to 30 diameters, and to limit the maximum fibre stress to 12,000 lb per square inch. The sectional areas are computed by the use of the ordinary formulæ for columns and struts.

For girders of small spans "I" beams or channels are generally used, but for greater spans girders are built

Girders. of riveted work in the form of boxes with top and bottom plates, side plates, and angles with proper stiffening bars on the side plates, or "I's," or lattice, or other forms of truss work. In girders and beams the maximum fibre stress is usually limited to 16,000 lb. In very short girders the shear must be computed, and in long girders the deflexion, particularly the flexure from the variable load, since a flexure of more than $\frac{1}{100}$ of the length is liable to crack the plastering of the ceilings carried by the girders. The same necessity for computing shear and flexure applies to the floor beams. The floors between the girders are constructed of "I" beams, spaced generally about 5 feet between centres; their ends are usually framed to fit the form of the girders, and rest

either upon their lower flanges, or upon seats formed of angles riveted to their webs, being secured to them by a pair of angles at each end of the beam riveted to its web and to the web of the girder. Sometimes the beams rest upon the girders, and are riveted through the flanges to it; in this case the abutting ends of beams are spliced by scarf plates placed on each side of the webs and secured by rivets. A similar construction is followed for flat roofs, the grades being generally formed in the girder and beam construction, and a flat ceiling secured by hanging from them, with steel straps, a light tier of ceiling beams. The floor beams are tied laterally by rods in continuous lines placed at or above their neutral axis. It is usual in both girders and beams to provide not only for the safe support of the greatest possible distributed load, but for the greatest weight, such as that of a safe or other heavy piece of furniture which may be moved over the floor at its weakest points, the centres of the girders and beams. It must always be borne in mind that the formulæ for the ultimate strength of the "I" beams only hold good when the upper chord or flange is supported laterally.

Steel cages may be divided into two classes. In the first and more frequent type the exterior columns and girders are embedded in and hidden by the masonry of the walls, in some cases being covered on their exterior surface by as little as 4 and generally by only 8 inches of masonry. In the second system the columns are placed inside of the wall, and beams or channels in couples are run in each side of and past the wall columns, or a floor beam is run through the column and allowed to project beyond it, or the floor beams are allowed to run over a wall girder between the columns and project beyond it, the projections in each case serving as cantilevers to carry the girders which are incorporated in the masonry of the wall for its direct support. The wall girders in both forms of construction are formed of "Z's," "T's," or channels, sometimes carrying plates of proper forms which are riveted to them. The wall girders are always incorporated in the masonry. When the exterior columns and girders are embedded in the wall, the cement masonry and painted surfaces of the steel are expected to guard it from corrosion. Time only can prove whether this protection will be permanently efficient; for masonry, particularly when of brick, unless absolutely free from defects or cracks, and unless kept perfectly painted, will not only fail as a waterproof covering, but will maintain a damp surface in-contact with the frame for a considerable time after each beating storm. It is claimed that a coating of cement mortar will prevent the oxidation of steel, but it is certain that it is very efficient in preventing the oxidation of paint. For the cantilever system it is claimed that all eccentricity of column loads is avoided, that the columns standing free within the wall are as readily protected from corrosion as any interior columns, that they can be at any time uncovered, examined, and if necessary replaced, and that while the failure of a column may result in the collapse of the building, the failure of a wall girder would be a local injury of relatively small importance, since in almost all cases there is a sufficient margin of strength in the wall to transfer the load to the wall girder next below.

The steel used throughout the entire structure should be subjected to the most thorough chemical and mechanical tests and inspection, first at the mill and subsequently at the fabricating shops and the building, to insure that it shall not contain more than .08 per cent. of phosphorus or .06 per cent. of sulphur, that it shall have an ultimate strength of between 60,000 and 70,000 lb per square inch, with an elastic limit of not less than 35,000 lb per square inch, and an elongation

Forms of steel cage.

Materials used.

before fracture of not less than 25 per cent. in 8 inches of length, and that a piece of the material may be bent cold 180 degrees over a mandril equal to the thickness of the piece tested without fracture of the fibre on the outside of the bend. At least two pieces are taken from each melt or blow at the mill, and are stamped or marked, and all the various sections rolled from the melt or blow are required to bear a similar stamp or mark for identification. All finished material is carefully examined to see that it possesses a smooth surface, and that it is free from cracks, seams, and other defects, and that it is true to section throughout. Rivets are either of wrought iron or of extra soft steel, with an ultimate tensile strength of 55,000 lb per square inch. The material must be sufficiently tough to bend cold 180 degrees flat on itself without sign of fracture. The greatest care is taken that no steel is left in a brittle condition by heating and cooling without proper annealing. All abutting joints in riveted work are faced to exact lengths and absolutely at right angles to the axis of the piece, and are spliced by scarf plates of proper dimensions adequately secured by rivets. The work should be so accurate that no packing pieces are necessary. If the conditions are such that a packing or filling piece must be used, the end of one piece is cut to a new and true surface, and the filling piece is planed to fill the space accurately. Where cast iron is used it must be of tough gray iron free from defects. In testing it pieces 1 inch square, 14 inches long, are cast from each heat and supported on blunt knife edges spaced 12 inches apart; under a load in the centre of the piece of 2500 lb the deflexion must not exceed $\frac{3}{16}$ of an inch.

All metal should receive one coat of paint at the works before shipment. All faced and turned surfaces should receive a coat of white lead or tallow before leaving the shop, and the entire structure should receive two coats of paint after erection. As the protection from corrosion will largely depend upon the paint, the most careful inspection is employed to insure that the metal is perfectly clean from scale and thoroughly dry when painted, and that no painting is done in damp or frosty weather. The paint must be applied with an ordinary painter's brush, and well worked in over the entire surface by hand to secure an even and perfect covering. It is valuable as a protection from corrosion in proportion to the amount of oil with which the metal can be coated by its application. The pigment itself is of small value except as a vehicle to assist in the spread of oil, and as facilitating the inspection of the work to insure that the oil has been thoroughly and evenly spread. The pigment which allows the spread of the largest percentage of oil is therefore the most valuable as a preventive of corrosion.

The filling between the girders and floor beams consists of segmental arches of brick, segmental or flat arches of porous (sawdust) terra cotta, or hard-burned hollow terra-cotta voussoirs, or various patented forms of concrete floors containing ties or supports of steel or iron. In all cases it is customary to fill on top of the arches with a strong Portland cement concrete to a uniform level,

Floors and partitions.

generally the top of the deepest beam; the floor filling is constructed and carried to this level immediately upon the completion of each tier of beams, for the purpose not only of stiffening the frame laterally, and of adding to its stability by the imposition of a static load, but also to afford constantly safe and strong working platforms at regular and convenient intervals for use throughout the entire period of the construction. In cases in which the lateral rigidity of the floors is depended upon to transfer the horizontal strains to the exterior walls which are framed to resist

them, no form of floor construction should be used which is not laterally strong and rigid. With very rapid building, no method of construction of floors, furrings, or partitions should be adopted which will not dry out with great speed. In flat forms of masonry floor construction the level of its bottom is placed somewhat below the bottom of the "I" beams and girders, so that when it is plastered a continuous surface of at least an inch of mortar will form a fireproof protection for the lower flanges of the beams and girders. Where the width of the flange is considerable it is first covered with metal lath secured to the under side of the floor masonry. Girders projecting below the floor are usually encased in from 1 to 2 inches of fireproof material, 2 or 4 inches of which is also put on all columns. Such fireproof coverings, and also interior partitions, are composed of hollow, hard-burned terra-cotta blocks, of porous (sawdust) terra cotta, or various plastic compositions applied to metallic lath, many of which are patented both as to material and method of application. The most simple test for the value of a system of fireproof coverings, and of partitions and furrings, is to erect a large sample of the work and to subject it alternately to the continued action of an intensely hot flame which is allowed to impinge upon it, and to a stream of cold water directed upon it from the ordinary service nozzle of a steam fire-engine. It is important in all fireproofing of columns and girders, and in all floor construction, furring, and partitions, that there shall be no continuous voids, either vertical or horizontal, which may possibly serve as flues for the spread of heat or flame in case of fire. All furrings and partitions must be started on the solid masonry of the floors to prevent the possible passage of fire from the room in which it may occur. The failure to make this provision has been the cause of very serious losses in buildings which were supposed to be fireproof.

It is customary to lay all necessary horizontal gas pipes and electric wire conduits on the flat Portland cement concrete surface of the floors, and, where wooden floors are to be used, to lay wooden sleepers on the same surface of a uniform depth as great as the diameter of the hubs at the joints of the largest pipes. The sides of the sleepers are bevelled inwards toward their tops. The entire surface is filled to the level of the sleepers, which is the underside of the wooden floor, or to the same level if marble or tile floors are to be laid, with a very light concrete formed of screened anthracite coal cinders, or preferably locomotive screenings mixed with enough cement only to produce a hard mass. A wooden floor laid in contact with masonry needs no fireproofing; it will smoulder, but it will not burn rapidly.

In some buildings the wood used for door sashes and trimming is subjected to one of the patented fireproofing processes. If such are used it is important that they should be tested to prove both that the fireproofing is permanent, and that it will not cause in the presence of water the corrosion of the steel with which it may be in contact. In some buildings doors, sashes, and window frames are covered with light metals, or are made of patented fireproof composition. If covered with metal, in order to be thoroughly efficient, the parts must be united with lock joints, not solder. In some buildings the sashes of interior partitions are glazed with wire-glass (a glass in which a mesh of fine wire is bedded in the centre of the sheet), and in some cases squares of plate-glass not more than 4 inches in diameter, united by a heavy joint of copper electrically deposited, are used for the same purpose. Both methods have proved singularly efficient in arresting the spread of fire.

It is impossible to design a building which cannot be injured by fire, but the construction should be such that

in case of an interior fire the damage may be confined to the place in which it originates, and that the efficiency of the weight-carrying supports shall not be destroyed. Experience has proved that unprotected steel and iron are not fireproof—when heated to a dull red heat they lose their efficiency—but that it is difficult, if not impossible, to heat metal, which is embedded in masonry or protected by a substantial and proper fireproof covering, to the point at which its strength is seriously impaired. Unless the building is surrounded by fireproof structures, the danger from exterior conflagration is infinitely greater than from interior fires, and is usually greater on the rear and sides than on the public streets. When there is a possibility that a mass of flame from the conflagration of adjacent property may be driven by wind against the exterior walls, the windows should be protected by fireproof shutters (wood covered by metal has proved the most efficient), or the sash should be covered with metal and glazed with wire-glass, or with very small panes of thick plate-glass in metal sash. In warehouses and shops and structures erected to contain large quantities of inflammable material, there should be used the least possible amount of material which is at all affected by fire, and every precaution should be observed to isolate the different floors and sections in case of conflagration. The lifts should be enclosed in masonry shafts, and should have self-closing fireproof doors, and the staircases should be built in masonry enclosures shut off from the lifts by similar doors. In hotels, apartments, and office buildings the mass of inflammable material which they contain is so small that unless there has been careless or improper construction a fire is readily confined to the place in which it originates until it can be extinguished; but the staircases should be built as far as possible from the lifts, and if they are constructed with stone treads laid on metal strings, the treads and platforms should be supported throughout their entire surface by metal, that they may afford safe footing for the tenants and for firemen in case they are shattered by the action of heat, water, or falling material.

Very tall buildings should be supplied with special arrangements to facilitate the extinction of fire, since the longitudinal strength of a fire hose is not great enough to permit it to support its own weight when filled if hoisted to a sufficient height to reach the upper storeys, and passing the hose in and out of windows or up staircases to give it the necessary support is both difficult and untrustworthy. It has become the practice to erect at convenient points within the building steel stand-pipes, generally 6 inches in diameter, extending from the pavement to the roof, provided at each storey with double branches and plugs of the dimension and pitch of screw to receive the regulation fire-hose connexion. Sufficient lengths of hose are constantly connected to these stand-pipes to reach all parts of the building. At the bottom is a check-valve. A branch is connected with the house tank so that the stand-pipes are constantly kept full of water, and as far as the supply of the tank is concerned are immediately efficient in case of fire. At the pavement proper screw plugs are provided to make connexions with the town steam fire-engines, and at the tank a check-valve is provided to act against the fire-engine pressure. The whole system is tested to a pressure of 300 lb to the inch. With careful construction, the best materials, and good workmanship throughout, there is no reason why a very tall building which depends upon a steel cage for its stability should not be as substantial, durable, and fireproof as a structure of ordinary height, with interior columns and girders of iron, and the ordinary fireproof floor construction. (G. B. F.)

Building Societies.—*United Kingdom* (for description, see *Ency. Brit.* iv. 513). By an Act passed in 1894 all the Benefit Building Societies established under the Act of 1836 after the year 1856 were required to become incorporated under the Act of 1874. There are, therefore, three categories of building societies:—1. Those established before 1856, which have not been incorporated under the Act of 1874 and remain under the Act of 1836. 2. Those established before 1874 under the Act of 1836, which have been incorporated under the Act of 1874. 3. Those which have been established since the Act of 1874 was passed. The first class still act by means of trustees. Of these societies about 70 are still in existence, the principal one being the Birkbeck. As most of them are of fifty years' standing or more, they are well established, and are still increasing their business. The second and third classes exceed 2000 in number, and have passed through some vicissitudes since the article in the ninth edition of the *Encyclopædia Britannica* was written. For several years their progress was steady, but there were not wanting signs that their prosperity was unsubstantial. A practice of receiving deposits repayable at call had sprung up, which must lead to embarrassment where the funds are invested in loans repayable during a long term of years. It was surmised, if not actually known, that many societies had large amounts of property on their hands, which had been reduced into possession in consequence of the default of borrowers in paying their instalments. A practice had also grown up of establishing mushroom societies, which did little more than pay fees to the promoters. The vicious system of trafficking in advances that had been awarded by ballot, near akin to gambling, prevailed in many societies. These signs of weakness had been observed by the well-informed, and the disastrous failure of a large society incorporated under the Act of 1874, the *Liberator*, which had in fact long ceased to do any genuine building society business, hastened the crisis. This society had drawn funds to the amount of more than a million sterling from provident people in all classes of the population and all parts of the country by specious representations, and had applied those funds not to the legitimate purpose of a building society, but to the support of other undertakings in which the same persons were concerned who were the active managers of the society. The consequence was that the whole group of concerns became insolvent, and the *Liberator* depositors and shareholders were defrauded of every penny of their investments. Many of them suffered great distress from the loss of their savings, and some were absolutely ruined. The result was to weaken confidence in building societies generally, though this was not quite logical, inasmuch as the *Liberator* Society had long ceased to do any legitimate building society business; but it was very marked in the rapid decline of the amount of the capital of the incorporated building societies. From its highest point (nearly 54 millions) reached in 1887, it fell to below 43 millions in 1895. On some societies, which had adopted the deposit system, a run was made, and several were unable to stand it. The Birkbeck Society was for two days besieged by an anxious crowd of depositors clamouring to withdraw their money; but luckily for that society, and for the building societies generally, a very large portion of its funds was invested in easily convertible securities, and it was enabled by that means to get sufficient assistance from the Bank of England to pay every depositor who asked for his money without a moment's hesitation. Its credit was so firmly established by this means that many persons sought to pay money in. Had this very large society succumbed the results would have been disastrous to the whole body of building societies. As the case stood, the energetic

means it adopted to save its own credit reacted in favour of the societies generally.

The Liberator disaster convinced everybody that something must be done towards avoiding such calamities in future. The Government of the day brought in a bill for that purpose, and several private members also prepared measures—most of them more stringent than the Government bill. All the bills were referred to a select committee, of which Mr Herbert Gladstone was the chairman. As the result of the deliberations of the committee, the Building Societies Act of 1894 was passed. Meanwhile the Rt. Hon. W. L. Jackson, a member of the committee, moved for an address to Her Majesty for a return of the property held in possession by building societies. This was the first time such a return had been called for, and the managers of the societies much resented it; there were no means of enforcing the return, and the consequence was that many large societies failed to make it, notwithstanding frequent applications by the Registrar. The Act provided that henceforth all incorporated societies should furnish returns in a prescribed form, including schedules showing respectively the mortgages for amounts exceeding £5000; the properties of which the societies had taken possession for more than twelve months through default of the mortgagors; and the mortgages which were more than twelve months in arrear of repayment subscription. The Act did not come into operation till 1st January 1895, and the first complete return under it was not due till 1896, when it appeared that the properties in possession at the time of Mr. Jackson's return must have been counted for at least seven and a half millions in the assets of the societies. This has since been reduced to four and a quarter millions. In the two years 1897, 1898, the societies reduced their properties in possession from 14 per cent. of the whole of their mortgages to 10 per cent. Though this operation must have been attended with some sacrifice in many societies, upon the whole the balance of profit has increased rather than diminished; and if a loss is to be sustained, it is always best to face it at once and write it off. Thus this provision of the Act, though it greatly alarmed the managers of societies, has really been a blessing in disguise. The Act also gave power to the Registrar, upon the application of ten members, to order an inspection of the books of a society, but it did not confer upon individual members the right to inspect the books, which would have been more effective. It empowered the Registrar, upon the application of one-fifth of the members, to order an inspection upon oath into the affairs of a society, or to investigate its affairs with a view to dissolution, and even in certain cases to proceed without an application from members. It gave him ample powers to deal with a society which upon such investigation proved to be insolvent, and these have been exercised so as to procure the cheap and speedy dissolution of such societies. It also prohibited the future establishment of societies making advances by ballot, or dependent on any chance or lot, and provided an easy method by which existing societies could discontinue the practice of balloting. This method has been adopted in a few instances only. The Act, or the circumstances which led to it, has greatly diminished the number of new societies applying for registry.

The statistics of building societies belonging to all the three classes mentioned show that there were on 31st December 1898, 2586 societies in existence in the United Kingdom. Of these, 2495, having 612,874 members, made returns. Their gross receipts for the financial year were £38,221,443. The capital belonging to their members was £34,606,447, and the undivided balance of profit £3,334,129. Their liabilities to depositors and

other creditors were £21,533,550. To meet this they had mortgages on which £44,449,008 was due, but of this £4,226,325 was on properties which had been in possession more than a year, and £271,992 on mortgages which had fallen into arrear more than a year. Their other assets were £14,563,966, and certain societies showed a deficit balance which in the aggregate was £461,152. The total assets and income are more than three times the amount of the conjectural estimate made for 1870 by the Royal Commission, but though the increase of both in the twenty-eight years has undoubtedly been great, that estimate was probably under the mark. It is not too much to say that a quarter of a million persons have been enabled by means of building societies to become the proprietors of their own homes. (E. W. B.)

United States.—"Building and loan association" is a general term applied in the United States to such institutions as mutual loan associations, homestead aid associations, savings fund and loan associations, co-operative banks, co-operative savings and loan associations, &c. They are private corporations, for the accumulation of savings, and for the loaning of money to build homes. The first association of this kind in the United States of which there is any record was organized at Frankford, a suburb of Philadelphia, 3rd January 1831, under the title of the Oxford Provident Building Association. Their permanent inception took place between 1840 and 1850. The receipts or capital of the building and loan association consists of periodical payments by the members, interest and premiums paid by borrowing members or others, fixed periodical instalments by borrowing members, fines for failures to pay such fixed instalments, forfeitures, fees for transferring stock, entrance fees, and any other revenues or payments,—all of which go into the common treasury. When the instalment payments and profits of all kinds equal the face value of all the shares issued, the assets, over and above expenses and losses, are apportioned among members, and this apportionment cancels the borrower's debt, while the non-borrower is given the amount of his stock. A man who wishes to borrow, let us say, \$1000 for the erection of a house ordinarily takes five shares in an association, each of which, when he has paid all the successive instalments on it, will be worth \$200, and he must offer suitable security for his loan, usually the lot on which he is to build. The money is not lent to him at regular rates of interest, as in the case of a savings bank or other financial institution, but is put up at auction usually in open meeting at the time of the payment of dues, and is awarded to the member bidding the highest premium. To secure the \$1000 borrowed, the member gives the association a mortgage on his property and pledges his five shares of stock. Some associations, when the demand for money from the shareholders does not exhaust the surplus, lend their funds to persons not shareholders, upon such terms and conditions as may be approved by their directors. Herein lies a danger, for such loans are sometimes made in a speculative way, or on insufficient land value. Some associations make stock loans, or loans on the shares held by a stockholder without real estate security; these vary in different associations, some applying the same rules as to real estate loans. To cancel his debt the stockholder is constantly paying his monthly or semi-monthly dues, until such time as these payments, plus the accumulation of profits through compound interest, mature the shares at \$200 each, when he surrenders his shares, and the debt upon his property is cancelled.

Every member of a building and loan association must be a stockholder, and the amount of interest which a member has in a building and loan association is indicated by the number of shares

he holds, the age of the shares, and their maturing value. The difference between a stockholder in such an association and one in an ordinary corporation for usual business purposes lies in the fact that in the latter the member or stockholder buys his stock and pays for it at once, and as a rule is not called upon for further payment; all profits on such stocks are received through dividends, the value of shares depending upon the successful operation of the business. In the former the stockholder or member pays a stipulated minimum sum, say \$1, when he takes his membership and buys a share of stock. He continues to pay a like sum each month until the aggregate of sums paid, increased by the profits and all other sources of income, amounts to the maturing value of the stock, usually \$200, when the stockholder is entitled to the full maturing value of the share and surrenders the same. Shares are usually issued in series. When a second series is issued the issue of the stock of the first series ceases. Profits are distributed and losses apportioned before a new series can be issued. The term during which a series is open for subscription differs, but it usually extends over three or six months, and sometimes a year. Some associations, usually known as perpetual associations, issue a new series of stock without regard to the time of maturity of previous issues. It is the practice in such associations to issue a new series of stock every year. Instead of shares that are paid in instalments, some associations issue prepaid shares and paid-up shares. *Prepaid shares*, known also as partly paid-up shares, are issued at a fixed price per share in advance. They usually participate as fully in the profits as the regular instalment shares, and when the amount originally paid for such shares, together with the dividends accrued thereon, reaches the maturing or par value, they are disposed of in the same manner as regular instalment shares. Some associations, instead of crediting all the profits made on this class of shares, allow a fixed rate of interest on the amount paid therefor at each dividend period, which is paid in cash to the holder thereof. This interest is then deducted from the profits to which the shares are entitled, and the remainder is credited to the shares until such unpaid portion of the profits, added to the amount originally paid, equals the maturing or par value. *Paid-up shares* are issued upon the payment of the full maturity or par value, when a certificate of paid-up stock is issued, the owners being entitled to receive in cash the amount of all dividends declared thereon, subject to such conditions or limitations as may be agreed upon. These shares sometimes participate as fully in the profits as the regular instalment shares, but in most cases a fixed rate of interest only is allowed, the holders of the shares usually assigning to the association all right to profits above that amount. Certificates of matured shares are also issued to holders of regular instalment shares, who prefer to leave their money with the association as an investment.

Prior to the maturing of a share it has two values, the holding or book value and the withdrawal value. The book value is ascertained by adding all the dues that have been paid to the profits that have accrued; that is to say, it is the actual value of a share at any particular time. The withdrawal value is that amount of the book value which the association is willing to pay to a shareholder who desires to sever his connexion with the association before his share is matured. Some associations do not permit their members to withdraw prior to the maturing of their shares. Then the only way a shareholder can realize upon his shares is by selling them to some other person at whatever price he can obtain. There are twelve or more plans for the withdrawal of funds. Every association has full regulations on all such matters.

The purchase of a share binds the shareholder to the necessity of keeping up his dues, and thus secures to him not only the benefits of a savings bank but the benefit of constantly accruing compound interest. This accomplishes the first feature of the motive of a building and loan association. The second is accomplished by enabling a man to borrow money for building purposes. It is a moot question whether this method of obtaining money for the building of homes is more or less economical than that of obtaining it from the ordinary savings banks or from other sources. Sometimes the premium which must be paid to secure a loan increases the regular interest to such an amount as to make the building and loan method more expensive than the ordinary method of borrowing money, but a building and loan association has a moral influence upon its members, in that it encourages a regular payment of instalments. Some associations have a fixed or established premium rate, and under such circumstances loans are awarded to the members in the order of their applications or by lot. The premium may consist of the amount which the borrower pays in excess of the legal interest, or it may consist of a certain number of payments of dues or of interest to be made in advance. There are very many plans for the payment of premiums, nearly seventy relating to real estate loans being in vogue in different associations in different parts of the United States; but in nearly all cases the borrower makes his regular payments of dues and interest until the shares pledged

have reached maturing value. There is also a great variety of plans for the distribution of profits, something like twenty-five such plans being in existence. The methods of calculating interest and profits are somewhat complicated, but they are all found in the books to which reference will be made. The various plans for the payment of premiums, distribution of profits, and withdrawals, and the calculations under each, are given in full in the Ninth Annual Report of U.S.A. Commissioner of Labour.

Most building and loan associations confine their operations to a small community, usually to the county in which they are situated; but some of them operate on a large scale, extending their business enterprises even beyond the borders of their own State. These national associations are ready to make loans on property anywhere, and sell their shares to any person without reference to his residence. In local associations the total amount of dues paid in by the shareholders forms the basis for the distribution of profits, while in most national associations only a portion of the dues paid in by the shareholders is considered in the distribution. For instance, in a national association the dues are generally 60 cents a share per month, out of which either 8 or 10 cents are carried to an expense fund, the remainder being credited on the loan fund. The expense fund thus created is lost to the shareholders, except in the case of a few associations which carry the unexpended balances to the profit and loss account, and whatever profits are made are apportioned on the amount of dues credited to the loan fund only. The creation of an expense fund in the nationals has sometimes been the source of disaster. Safety or security in both local and national associations depends principally upon the integrity with which their affairs are conducted, and not so much upon the form of organization or the method of distribution. Some of the States—New York, Massachusetts, New Jersey, Ohio, Illinois, California, and others—bring building and loan associations under the same general supervision of law thrown around savings banks. In some States nothing is officially known of them beyond the formalities of their incorporation. Though the business of the associations is conducted by men not trained as bankers, it yet meets with rare success. Associations disband when not successful, but when they disband great loss does not occur because the whole business of the association consists of its loans, and these loans are to its own shareholders, as a rule, who hold the securities in their associated forms. The amount of money on hand is always small, because it is sold or lent as fast as paid in. A disbanded association, therefore, simply returns to its own members their own property, and but few real losses occur. Investment in a building and loan association is as nearly absolutely safe as it can be, for the monthly dues and the accumulated profits, which give the actual capital of the association, are lent or sold, as it is termed, by the association as fast as they accumulate, and upon real estate or upon the stock of the association itself. The opportunities for embezzlement, therefore, or for shrinkage of securities, are reduced to the minimum, and an almost absolute safety of the investment is secured.

The growth of these associations has been very rapid since 1840. In 1900 they numbered 5838, and occur in forty-eight States and territories. Pennsylvania has the greatest number, 1079. The next in order are—Ohio, 721; Illinois, 669; Indiana, 445; New York, 418; Missouri, 366; New Jersey, 288; Maryland, 240; Kentucky, 148; California, 133; Massachusetts, 115; Minnesota, 97. Their accumulated assets have increased to an enormous amount. The Federal Government, through the Department of Labour, made an investigation of building and loan associations, and published its report in 1893, with the results given in the table on the next page.

The total dues paid in on instalment shares, according to the following statement, amounted to \$450,667,594. The business represented by this great sum, conducted quietly, with little or no advertising, and without the experienced banker in charge, shows that the common people, in their own ways, are quite competent to take care of their savings, especially when it was shown by the report cited that but thirty-five of the associations then in existence met with a net loss at the end of their latest fiscal year, and that this loss amounted to only a little over \$23,000. In addition to the statistics of a general character quoted in the table, Bulletin No. 10 (May 1897) of the United States Department of Labour contains a calculation of the business at that date, based upon such States' reports as were available. That calcula-

Varia- tions in methods.

The premium may consist of the amount which the borrower pays in excess of the legal interest, or it may consist of a certain number of payments of dues or of interest to be made in advance. There are very many plans for the payment of premiums, nearly seventy relating to real estate loans being in vogue in different associations in different parts of the United States; but in nearly all cases the borrower makes his regular payments of dues and interest until the shares pledged

Statistics of Building and Loan Associations, 1893.—GENERAL RESULTS FOR THE UNITED STATES.

	Local.	National.	Total.
Number of associations	5,598	240	5,838
Male shareholders in associations reporting	710,156	209,458	919,614
Female shareholders in associations reporting	263,338	44,440	307,828
Total shareholders in associations reporting	973,494	253,898	1,227,392
Average shareholders per association reporting	173.9	1,057.8	209.2
Shareholders who are borrowers in associations reporting	402,212	53,199	455,411
Per cent. of borrowers in associations reporting	41.5	20.9	36.2
Number of shares in associations reporting	10,381,081	2,874,841	13,255,922
Total dues and profits	\$413,047,228	\$37,020,366	\$450,067,594
Average shares per shareholder in associations reporting	10.6	11.2	10.5
Average dues and profits per shareholder in associations reporting	\$398.11	\$36.73	\$257.26
Average value of shares in associations reporting	\$39.75	\$12.12	\$34.18
Total profits	\$74,402,909	\$6,261,147	\$80,664,116
Average size of loans in associations reporting	\$1,133	\$920	\$1,120
Homes acquired in associations reporting	290,803	23,952	314,755

a Associations not reporting, local, 1503; national, 60; total, 1569.
 b Associations not reporting, local, 88; national, 4; total, 92.
 c Associations not reporting, local, 69; national, 4; total, 73.
 d Associations not reporting, local, 18; national, 4; total, 22.
 e Based on 5535 local associations, 226 national associations; total, 5761.
 f Based on 2128 local associations, 45 national associations; total, 2173.
 g Associations not reporting, local, 1338; national, 68; total, 1394.

tion showed a growth in almost every item. It is safe to say that the total dues and profits of building and loan associations in 1901, constituting their assets, reached about \$600,000,000, with probably 6000 associations constantly contributing to its growth. During the years of depression ending with 1899 the growth of building and loan associations was naturally slower than in prosperous periods.

(C. D. W.)

Buitenzorg, a district in the island of Java (till 1866 an assistant residency), forming the southern part of the residency of Batavia, with an area of 1447 square miles. It occupies the northern slopes of a range of hills separating it from Preanger, and has a fertile soil. Tea, coffee, cinchona, sugar-cane, and rice are cultivated, as are also nutmegs, cloves, and pepper. *Buitenzorg*, the capital, in direct line about 32 miles S. of Batavia, is the usual residence of the Governor-General of the Dutch East Indies. Since 1875 the offices of the General Secretary and the bureaux of mines and of the state railway have been transferred to this place, which has a well-equipped hospital and sanatorium. A Chinese colony numbering about 5000 has been established in the vicinity.

Bukovina, a duchy and crown-land in the Cisleithan half of the Austro-Hungarian monarchy. Population in 1869, 511,964; in 1880, 571,671; in 1890, 646,591, which is equivalent to 160.2 inhabitants per square mile. Proportion of females to males, 993 to 1000; 41.77 per cent. are Ruthenians, 32.41 per cent. Rumanians, 20.79 per cent. Germans, 3.67 per cent. Poles, the remainder being made up of Czechs, Russians, &c.; 69.71 belong to the Greek Oriental Church, 12.79 per cent. are Jews, 11.19 per cent. Roman Catholics, 3.25 per cent. Greek United Church, and 2.5 per cent. are Protestant. Population in 1900, 729,921. In 1896 the marriage-rate was 7.85; the birth-rate, 44.99; or, excluding still-births,

43.86; and the death-rate 29.90—with the exception of Istria and Carniola the highest in Austria. The illegitimate births were 12.24 per cent. of the whole. The marriage-, birth-, and death-rates, as well as the proportion of illegitimacy, are diminishing. Bukovina sends 11 members to the Reichsrath (5 Rumanians, 2 Ruthenians, 3 Germans, and 1 Pole). The Diet is composed of 14 Rumanians, 8 Germans, 5 Ruthenians, and 4 Poles. German enjoys special privileges in this crown-land, being the official language of the administration, of law, and of instruction in the university. Education is provided for by a university at Czernowitz (three faculties: theology, law, and philosophy—371 students), 5 gymnasia, 346 elementary schools (attended by about 63 per cent. of the children), together with 54 technical and continuation schools. The latter show a marked increase, and progress is also visible in elementary education. In 1890 the illiterates formed 77.2 per cent. of the population, a reduction of 6.3 per cent on the preceding decade. With the exception of Dalmatia, Bukovina has the largest proportion of illiterates in Austria. Of the 31 periodicals and newspapers published in 1898, 19 are German, 6 Ruthenian, 3 Rumanian, 1 Polish, and 2 polyglot. Three-fourths of the population are engaged in agriculture and forestry, 13.76 per cent. in mining and industry, and 5.31 per cent. in trade. Agriculture has made considerable progress. Distilleries, milling, and brewing represent the most important industries. Commerce is chiefly in the hands of the Jews and Armenians, and is mainly confined to raw products, such as corn, cattle, wood, wool, and other animal products. Horse-breeding is encouraged by a government stud at Radautz. In 1897 there were 351 kilometres of railway, 4088 kilometres of roads, and 351 kilometres of waterways, serviceable only for floating timber. There were 93 post and 46 telegraph offices, with 761 kilometres of line and 1772 kilometres of wire.

Bulandshahr, a town and district of British India, in the Meerut division of the North-West Provinces. The town is on the right bank of the Kali Nadi. The population in 1891 was 16,931; the municipal income in 1897-98 was Rs.17,347. Its present handsome appearance is due to a recent collector, the late Mr F. S. Growse, who was active in erecting public buildings, and in encouraging the local gentry to beautify their own houses. In particular, it boasts a fine bathing-ghat, a town hall, a market-place, a tank to supply water, and a public garden.

The district of BULANDSHAHR has an area of 1911 square miles. The population in 1891 was 949,914, being 497 persons per square mile. Classified according to religion, Hindus numbered 769,401; Mahomedans, 179,019; Christians, 210, of whom 79 were Europeans; "others," 1284. In 1901 the population was 1,138,296, showing an increase of 20 per cent. The land revenue and rates were Rs.22,73,390, the incidence of assessment being R.1:10:7 per acre; the number of police was 2801. Out of a total cultivated area in 1896-97 of 845,668 acres, 199,272 were irrigated from the Ganges canal and 193,522 from wells. There are 190 indigo factories, employing 16,000 persons, with an out-turn valued at Rs.10,52,190; and five mills for pressing and cleaning cotton. The main line of the East Indian railway and the Oudh and Rohilkhand railway cross the district. The chief centre of trade is Khurja.

Bulawayo, a town of British South Africa, the largest place in Southern Rhodesia, and formerly chief military kraal

of the Matabele state. It occupies a central position, about 5000 feet above sea-level, on the Matoppos hills, and is 1360 miles from Cape Town, with which it is connected by rail. It is the present terminus of the southern section of the Cape to Cairo trunk line, which was in 1901 advancing in the direction of the rich coalfields discovered in the Wanki district below the Victoria Falls of the Zambezi. The "Place of Slaughter," as its name is interpreted, was originally founded about 1838 by Lobengula's father, Moselekatse, some distance to the south of its present position, and continued to be the royal residence till its occupation by the British South Africa Chartered Company's forces in 1893. Since then it has been completely transformed, and is now one of the most flourishing European towns in South Africa, with a population estimated in 1900 at 6000, of whom over 3000 were whites. There have been erected substantial government offices, a municipal building, banks, churches, hotels, schools, hospitals, a public library, newspaper and telegraph offices. An extensive telephone system has been for some time in operation. Lying in the midst of rich goldfields, and also possessing considerable agricultural resources, it has every prospect of becoming the centre of European culture and civilizing influences in the region between the Limpopo and the Zambezi.

Buldana, a town and district of India, in Berar or the Hyderabad assigned districts, under British administration. The town had a population in 1891 of 3243.

The district has an area of 2809 square miles; and had a population in 1891 of 477,138, being 171 persons per square mile. Classified according to religion, Hindus numbered 442,588; Mahomedans, 34,405; Christians, 103, of whom 18 were Europeans; "others," 42. In 1901 the population was 423,685, showing a decrease of 12 per cent., due to the effects of famine. The land revenue and rates in 1897-98 were Rs.12,55,977, the incidence of assessment being 13 annas per acre; the number of police was 455. In 1897-98, out of a total cultivated area of 1,208,008 acres, 55,471 were irrigated from wells, &c. The only manufacture is cotton cloth. Cotton, wheat, and oil-seeds are largely exported. The Nagpur line of the Great Indian Peninsula railway runs through the north of the district. The most important place of trade is Malkapur—population (1891), 9222—with three factories for ginning and pressing cotton. In 1896-97 there were 214 schools, with 7500 pupils, the proportion of boys at school being 20 per cent. of the estimated male population of school-going age. The death-rate in 1897 was 53.6 per 1000.

Buldur, or BURDUR, chief town of a sanjak in the Konia vilayet in Asia Minor, called by the Christians *Polydoron*, altitude 3150 feet, situated, in the midst of gardens, about two miles from the brackish lake Buldur Geul, ancient Ascania Limne. Linen-weaving and leather-tanning are the principal industries. Population, 12,000.

BULGARIA.

1. GEOGRAPHY AND STATISTICS.

BULGARIA, the youngest of European states, obtained its independence under the first article of the Treaty of Berlin (13th July 1878), being declared an autonomous and tributary principality under the suzerainty of the sultan of Turkey. The newly-created state comprised only the territory between the Balkans and the Danube, together with the mountainous districts of Sofia, Samakov, Küstendil, and Trn. By Article XIII. of the same instrument, a province designated "Eastern Rumelia" was formed south of the Balkans, endowed with administrative autonomy under a Christian governor-general, but left subject to the direct political and military authority of the sultan. The *de facto* union of the two political divisions was accomplished by the revolution of Philippopolis in 1885. In the following year Prince Alexander of Bulgaria was nominated to the governor-generalship of Eastern Rumelia by the Sultan, and in 1896 his successor, Prince Ferdinand, was confirmed in that office. A legal union of the two Bulgarias was thus effected in the person of their ruler; and as their administrations have been amalgamated without protest on the part of Turkey, we are justified in treating of them as a single state.

Bulgaria is bounded on the north by the Danube, from its confluence with the Timok to the eastern suburbs of Silistra (Silistria), whence a line, forming the Rumanian frontier, is drawn to a point on the Black Sea coast a little south of Mangalia. On the east it is washed by the Black Sea; on the south the Turkish frontier, starting from a point on the coast about 15 kilometres south of Sozopolis, runs in a south-westerly direction, crossing the river Maritza at Mustafa Pasha, and reaching the Arda at Adakali. The line laid down by the Berlin Treaty ascended the Arda to Ishiklar, thence following the crest of Rhodope to the westwards, but the cantons of Krjali and Ruphus included in this boundary were restored to Turkey in 1886. The present frontier, passing to the north of these districts, reaches the watershed of Rhodope a little north of the Dospat valley, and then follows the crest of the Riliska Planina to the summit of Tcherni Vrkh, where the Servian, Turkish, and Bulgarian territories meet. From this point the western or Servian frontier passes

northwards, leaving Trn to the east and Pirot to the west, reaching the Timok near Kula, and following the course of that river to its junction with the Danube. The area thus enclosed extends from lat. 44° 12' 30" to 41° 37' 30" N., and from long. 26° 16' 31" to 19° 52' 31" E. (meridian of Paris). The Berlin Treaty boundary is far from corresponding with the ethnological limits of the Bulgarian race, which were more accurately defined by the abrogated treaty of San Stefano (see *BALKAN PENINSULA*). A considerable portion of Macedonia, the districts of Pirot and Vrania, now belonging to Serbia, the northern half of the vilayet of Adrianople, and large tracts of the Dóbruja are, according to the best and most impartial authorities, mainly inhabited by a Bulgarian population.

The most striking physical features are the two mountain-chains of the Balkans and Rhodope, the former running east and west through the heart of the country, the latter forming for a considerable distance its southern boundary. The Balkans constitute the southern half of the great semicircular range known as the anti-Dacian system, of which the Carpathians form the northern portion. The great chain is sundered at the Iron Gates by the passage of the Danube; its two component parts present many points of resemblance in their aspect and outline, geological formation, and flora. The Balkans (ancient *Hæmus*) run almost parallel to the Danube, the mean interval being 60 miles; the summits are, as a rule, rounded, and the slopes gentle. The culminating points are in the centre of the range: Yumrukchál (2385 metres), Maragudúk (2380 m.), and Kadimlíá (2275 m.). The Balkans are known to the people of the country as the *Stara Planina* or "Old Mountain," the adjective denoting their greater size as compared with that of the adjacent ranges: "Balkan" is not a distinctive term, being applied by the Bulgarians, as well as the Turks, to all mountains. Closely parallel to the south are the minor ranges of the Sredna Gora or "Middle Mountains" (highest summit 1575 m.) and the Karaja Dag, enclosing respectively the sheltered valleys of Karlovo and Kazanlyk. At its eastern extremity the Balkan chain divides into three ridges, the central terminating in the Black Sea at Cape Eminé ("Hæmus"), the northern forming the watershed between the tributaries of the Danube and the rivers falling directly into the Black Sea. The Rhodope, or southern group, is altogether distinct from the Balkans, with which, however, it is connected by the Malka Planina and the Ikhtiman hills, respectively west and east of Sofia; it may be regarded as a continuation of the great Alpine system which traverses the Peninsula from the Dinaric Alps and the Shar Planina on the west to the Shabkhana Dag near the Ægean coast; its sharper outlines and pine-clad steeps reproduce the scenery of the Alps

rather than that of the Balkans. The imposing summit of Musallá (2930 m.), next to Liubotrú and Olympus, the highest in the Peninsula, forms the centre-point of the group; it stands within the Bulgarian frontier at the head of the Mesta valley, on either side of which the Perin Dagh and the Despoto Dagh descend south and south-east respectively towards the Aegean. The chain of Rhodope proper radiates to the east; owing to the retrocession of territory already mentioned, its central ridge no longer completely coincides with the Bulgarian boundary, but two of its principal summits, Sytké (2188 m.) and Karlyk (2081 m.), are within the frontier. From Musallá in a westerly direction extends the majestic range of the Rilská Planina, enclosing in a picturesque valley the celebrated monastery of Rila; many summits of this chain attain 2200 m. Farther west, beyond the Struma valley, is the Osogovska Planina,

culminating in Ruyen (2253 m.). To the north of the Rilska Planina the almost isolated mass of Vitosha (2291 m.) overhangs Sofia. Snow and ice remain in the sheltered crevices of Rhodope and the Balkans throughout the summer. The fertile slope trending northwards from the Balkans to the Danube is for the most part gradual and broken by hills; the eastern portion known as the *Deli Orman*, or "Wild Wood," is almost waterless, covered by forest, and thinly inhabited. The abrupt and sometimes precipitous character of the Bulgarian bank of the Danube contrasts with the swampy lowlands and lagoons of the Rumanian side. Northern Bulgaria is watered by the Lom, Ogust, Iskr, Vid, Osem, Yantra, and Eastern Lom, all, except the Iskr, rising in the Balkans, and all flowing into the Danube. The channels of these rivers are deeply furrowed and the fall is rapid; irrigation is consequently difficult and navigation impossible. The course of

-----Sernan and Montenegrin frontiers
-----Boundaries of Bulgaria and E. Rumelia according to the Berlin Treaty
-----Boundary of Bulgaria according to the Treaty of San Stefano.
Restored to Turkey in 1886.

SKETCH MAP OF BULGARIA.

the Iskr is remarkable : rising in the Rilska Planina, the river descends into the basin of Samakov, passing thence through a serpentine defile into the plateau of Sofia, where in ancient times it formed a lake ; it now forces its way through the Balkans by the picturesque gorge of Iskretz. Somewhat similarly the Deli, or " Wild," Kamchik breaks the central chain of the Balkans near their eastern extremity and, uniting with the Great Kamchik, falls into the Black Sea. The Maritza, the ancient *Hebrus*, springs from the slopes of Musallá, and, with its tributaries, the Tunja and Arda, waters the wide plain of Eastern Rumelia. The Struma (anc. and mod. Greek *Strymon*) drains the valley of Küstendil, and, like the Maritza, flows into the *Ægean*. The elevated basins of Samakov (lowest altitude, 930 m.), Trn (770 m.), Breznik (750 m.), Radomir (630 m.), Sofia (500 m.), and Küstendil (470 m.), are a peculiar feature of the western highlands.

The stratified formation presents a remarkable variety, almost all the systems being exemplified. The Archean, composed of gneiss and crystalline schists, and traversed by eruptive veins, extends over the greater part of the Eastern Rumelian plain, the Rilska Planina, Rhodope, and the adjacent ranges. North of the Balkans it appears only in the neighbourhood of Berkovitz. The other earlier Paleozoic

systems are wanting, but the Carboniferous appears in the western Balkans with a continental *facies* (Kulm). Here anthracitiferous coal is found in beds of argillite and sandstone. Red Sandstone and Conglomerate, representing the Permian system, appear especially around the basin of Sofia. Above these, in the western Balkans, are Mesozoic deposits, from the Trias to the upper Jurassic, also occurring in the central part of the range. The Cretaceous system, from the infra-Cretaceous Hauterivien to the Senonian, appears throughout the whole extent of Northern Bulgaria, from the summits of the Balkans to the Danube. Gosau beds are found on the southern declivity of the chain. Flysch, representing both the Cretaceous and Eocene systems, is widely distributed. The Eocene, or older Tertiary, further appears with nummulitic formations on both sides of the eastern Balkans; the Oligocene only near the Black Sea coast at Burgas. Of the Neogene, or younger Tertiary, the Mediterranean, or earlier, stage appears near Plevna (Plevna) in the Leithakalk and Tegel forms, and between Varna and Burgas with beds of spaniodons, as in the Crimea; the Sarmatian stage in the plain of the Danube and in the districts of Silistra and Varna. A rich mammaliferous deposit (*Hipparion*, *Rhinoceros*, *Dinotherium*, *Mastodon*, &c.) of this period has been found near Mesemvria. Other Neogene strata occupy a more limited space. The Quaternary era is represented

by the typical loess, which covers most of the Danubian plain; to its later epochs belong the alluvial deposits of the riparian districts with remains of the *ursus*, *equus*, &c., found in bone-caverns. Eruptive masses intrude in the Balkans and Sredna Gora, as well as in the Archæan formation of the southern ranges, presenting granite, syenite, diorite, diabase, quartz-porphry, melaphyre, liparite, trachyte, andesite, basalt, &c.

The severity of the climate of Bulgaria in comparison with that of other European regions of the same latitude is attributable

Climate. in part to the number and extent of its mountain ranges, in part to the general configuration of the Balkan Peninsula. Extreme heat in summer and cold in winter, great local contrasts, and rapid transitions of temperature occur here as in the adjoining countries. The local contrasts are remarkable. In the districts extending from the Balkans to the Danube, which are exposed to the bitter north wind, the winter cold is intense, and the river, notwithstanding the volume and rapidity of its current, is frequently frozen over; the temperature has been known to fall to -31° (Celsius). Owing to the shelter afforded by the Balkans against hot southerly winds, the summer heat in this region is not unbearable; its maximum is 37° . The high table-land of Sofia is generally covered with snow in the winter months; it enjoys, however, a somewhat more equable climate than the northern district, the maximum temperature being 30° , the minimum -19° ; the air is bracing, and the summer nights are cool and fresh. In the eastern districts the proximity of the sea moderates the extremes of heat and cold, which attain 32° and -18° respectively; the sea is occasionally frozen at Varna. The coast-line is exposed to violent north-east winds, and the Black Sea, the *πύρρος ἄνεμος*, maintains its evil reputation for storms. The sheltered plain of Eastern Rumelia possesses a comparatively warm climate; spring begins six weeks earlier than elsewhere in Bulgaria, and the vegetation is that of Southern Europe. In general the Bulgarian winter is short and severe; the spring short, changeable, and rainy; the summer hot, but tempered by thunderstorms; the autumn (*yasen*, "the clear time") magnificently fine and sometimes prolonged into the month of December. The mean temperature is 11° . The climate is healthy, especially in the mountainous districts. Malarial fever prevails in the valley of the Maritza, in the low-lying regions of the Black Sea coast, and even in the upland plain of Sofia, owing to neglect of drainage. The mean annual rainfall is 650 millimetres (Gabrovo, 1060; Sofia, 708; Varna, 470 millimetres).

The mineral wealth of Bulgaria is not inconsiderable. Among the minerals which are important, from an industrial point of

Minerals. view, are gold (found in small quantities), silver, graphite, galenite, pyrite, marcasite, chalcocine, sphalerite, chalcopryite, bornite, cuprite, hæmatite, limonite, ochre, chromite, magnetite, azurite, manganese, malachite, gyps, &c. The combustibles are anthraciferous coal, coal, "brown coal," and lignite. With the exception of coal, the minerals have hitherto been scarcely worked. The coal mines opened at Pernik in 1891 yielded in 1898 an output of 100,000 tons. Coal beds have recently been discovered at Trevna. Thermal springs, mostly sulphureous, exist in forty-three localities along the southern slope of the Balkans, in Rhodope, and in the districts of Sofia and Küstendil; maximum temperature at Zaparevo, near Dupnitsa, $82^{\circ}5$ (Celsius), at Sofia 48° . Many of these are frequented now, as in Roman times, owing to their valuable therapeutic qualities. The mineral springs on the north of the Balkans are, with one exception (Vrshetz, near Berkovitsa), cold.

Few special features are noticeable in the Bulgarian fauna. Bears are still abundant in the higher mountain districts,

Fauna. especially in the Rilska Planina and Rhodope; the Bulgarian bear is small and of brown colour, like that of the Carpathians. Wolves are very numerous, and in winter commit great depredations even in the larger country towns and villages; in hard weather they have been known to approach the outskirts of Sofia. The Government offers a reward for the destruction of both these animals. The roe deer is found in all the forests, the red deer is less common; the chamois haunts the higher regions of the Rilska Planina, Rhodope, and the Balkans. The jackal (*Canis aureus*) appears in the district of Burgas; the lynx is said to exist in the Sredna Gora; the wild boar, otter, fox, badger, hare, wild cat, marten, polecat (*Felictus putorius*: the rare tiger polecat, *Felictus sarmaticus*, is also found), weasel and shrewmouse (*Spermophilus citellus*) are common. The beaver (Bulg. *bebr*) appears to have been abundant in certain localities, e.g., Bebrovo, Bebreish, &c., but it is now apparently extinct. Snakes (*Coluber natrix* and other species), vipers (*Vipera berus* and *V. ammodytes*), and land and water tortoises are numerous. The domestic animals are the same as in the other countries of south-eastern Europe; the fierce shaggy gray sheep-dog leaves a lasting impression on most travellers in the interior. Fowls, especially turkeys, are everywhere abundant, and great numbers of geese

may be seen in the Moslem villages. The ornithology of Bulgaria is especially interesting. Eagles (*Aquila imperialis* and the rarer *Aquila fulva*), vultures (*Vultur monachus*, *Gyps fulvus*, *Neophron percnopterus*), owls, kites, and the smaller birds of prey are extraordinarily abundant; singing birds are consequently rare. The lammergeier (*Gypaetus barbatus*) is not uncommon. Immense flocks of wild swans, geese, pelicans, herons, and other waterfowl haunt the Danube and the lagoons of the Black Sea coast. The cock of the woods (*Tetrao urogallus*) is found in the Balkan and Rhodope forests, the wild pheasant in the Tunja valley, the bustard (*Otis tarda*) in the Eastern Rumelian plain. Among the migratory birds are the crane, which hibernates in the Maritza valley, woodcock, snipe, and quail: the great spotted cuckoo (*Coccyzus glandarius*) is an occasional visitant. The red startling (*Pastor roseus*) sometimes appears in large flights. The stork, which is never molested, adds a picturesque feature to the Bulgarian village. Of fresh-water fish, the sturgeon (*Acipenser sturio* and *A. huso*), sterlet, salmon (*Salmo huso*), and carp are found in the Danube; the mountain streams abound in trout. The Black Sea supplies turbot, mackerel, &c.; dolphins and flying fish may sometimes be seen.

The vegetation of Bulgaria has only recently received the scientific attention it deserves. In regard to its flora the country may be divided into (1) the northern plain sloping from the Balkans to the Danube, (2) the southern plain **Flora.** between the Balkans and Rhodope, (3) the districts adjoining the Black Sea, (4) the elevated basins of Sofia, Samakov, and Küstendil, (5) the Alpine and sub-Alpine regions of the Balkans and the southern mountain group. In the first-mentioned region the vegetation resembles that of the Russian and Rumanian steppes; in the spring the country is adorned with the flowers of the crocus, orchis, iris, tulip, and other bulbous plants, which in summer give way to tall grasses, umbelliferous growths, dianthi, astragal, &c. In the more sheltered district south of the Balkans the richer vegetation recalls that of the neighbourhood of Constantinople and the adjacent parts of Asia Minor. On the Black Sea coast many types of the Crimean, Transcaucasian, and even the Mediterranean flora present themselves. The plateaux of Sofia and Samakov furnish specimens of sub-alpine plants, while the vine disappears; the hollow of Küstendil, owing to its southerly aspect, affords the vegetation of the Macedonian valleys. The flora of the Balkans corresponds with that of the Carpathians; the Rila and Rhodope group is rich in purely indigenous types combined with those of the Central European Alps and the mountains of Asia Minor. The Alpine types are often represented by variants: e.g., the *Campanula alpina* by the *Campanula orbicula*, the *Primula farinosa* by the *Primula frondosa* and *P. exigua*, the *Gentiana germanica* by the *Gentiana bulgarica*, &c. The southern mountain group, in common, perhaps, with the unexplored highlands of Macedonia, presents many isolated types, unknown elsewhere in Europe, and in some cases corresponding with those of the Caucasus. Among the more characteristic genera of the Bulgarian flora are the following:—Centaurea, Cirsium, Linaria, Scrophularia, Verbasum, Dianthus, Silene, Trifolium, Euphorbia, Cytisus, Astragalus, Ornithogalum, Allium, Crocus, Iris, Thymus, Umbellifera, Sedum, Hypericum, Scabiosa, Ranunculus, Orchis, Ophris.

The principal forest trees are the oak, beech, ash, elm, walnut, cornel, poplar, pine, and juniper. The oak is universal in the thickets, but large specimens are now rarely found.

Forests. Magnificent forests of beech clothe the valleys of the higher Balkans and the Rilska Planina; the northern declivity of the Balkans is, in general, well wooded, but the southern slope is bare. The walnut and chestnut are mainly confined to Eastern Rumelia. Conifers (*Pinus silvestris*, *Picea excelsa*, *Pinus laricis*) are rare in the Balkans, but abundant in the higher regions of the southern mountain group, where the *Pinus peuce*, otherwise peculiar to the Himalayas, also flourishes. The wild lilac forms a beautiful feature in the spring landscape. Wild fruit-trees, such as the apple, pear, and plum, are common. The vast forests of the Middle Ages disappeared under the supine Turkish administration, which took no measures for their protection, and even destroyed the woods in the neighbourhood of towns and highways in order to deprive brigands of shelter. A law passed in 1889 prohibits disforestation, limits the right of cutting timber, and places the State forests under the control of inspectors. According to official statistics, 46,000 square kilometres, or nearly half the superficies of the Principality, are under forest, but the greater portion of this area is covered only by brushwood and scrub.

The Bulgarians, who constitute 75.67 per cent. of the inhabitants of the principality, are found in their purest type in the mountain districts, the Ottoman **Ethnology.** conquest and subsequent colonization having introduced a mixed population into the plains. The northern slopes of the Balkans from Belogradchik to Elena

are inhabited almost exclusively by Bulgarians; in Eastern Rumelia the national element is strongest in the Sredna Gora and Rhodope. Possibly the most genuine representatives of the race are the Pomaks or Mahommedan Bulgarians, whose conversion to Islam preserved their women from the license of the Turkish conqueror; they inhabit the highlands of Rhodope and certain districts in the neighbourhood of Lovetch (Lovtcha) and Plevna (Plevna). Retaining their Bulgarian speech and many ancient national usages, they may be compared with the indigenous Cretan, Bosnian, and Albanian Moslems. The Pomaks in the Principality are estimated at 26,000, but their numbers are declining. In the north-eastern district between the Yantra and the Black Sea the Bulgarian race is as yet thinly represented; most of the inhabitants are Turks, a quiet, submissive, agricultural population, which unfortunately shows a tendency to emigrate. The Black Sea coast is inhabited by a variety of races. The Greek element is strong in the maritime towns, and displays its natural aptitude for navigation and commerce. The Gagäuzi, a peculiar race of Turkish-speaking Christians, inhabit the littoral from Cape Eminé to Cape Kaliakra: they are of Turanian origin and descend from the ancient Kumani. The valleys of the Maritza and Arda are occupied by a mixed population consisting of Bulgarians, Greeks, and Turks: the principal Greek colonies are in Stanimaka, Kavakli, and Philippopolis. The origin of the peculiar Shôp tribe which inhabits the mountain tracts of Sofia, Breznik, and Radomir is a mystery. The Shôps are conceivably a remnant of the aboriginal race which remained undisturbed in its mountain home during the Slavonic and Bulgarian incursions: they cling with much tenacity to their distinctive customs, apparel, and dialect. The considerable Vlach or Ruman colony in the Danubian districts dates from the last century, when large numbers of Wallachian peasants sought a refuge on Turkish soil from the tyranny of the boyars or nobles: the department of Vidin alone contains thirty-six Ruman villages with a population of 30,550. Especially interesting is the race of nomad shepherds from the Macedonian and the Ægean coast who come in thousands every summer to pasture their flocks on the Bulgarian mountains; they are divided into two tribes—the Kutzovlaks, or “lame Vlaks,” who speak Rumanian, and the Hellenized Karakatchans or “black shepherds” (comp. the Mavro-vlaks, *μαύροι βλάχες*, of the Dalmatian coast) who speak Greek. The Tatars, a peaceable industrious race, are chiefly found in the neighbourhood of Varna and Silistra; they were introduced as colonists by the Turkish Government in 1861. They may be reckoned at 12,000. The gypsies, who are scattered in considerable numbers throughout the country, came into Bulgaria in the 14th century. They are for the most part Moslems, and retain their ancient Indian speech. They live in the utmost poverty, occupy separate cantonments in the villages, and are treated as outcasts by the rest of the population. The Bulgarians, being of mixed origin, possess few salient physical characteristics. The Slavonic type is far less pronounced than among the kindred races; the Ugrian or Finnish cast of features occasionally asserts itself in the central Balkans. The face is generally oval, the nose straight, the jaw somewhat heavy. The men, as a rule, are rather below middle height, compactly built, and, among the peasantry, very muscular; the women are generally deficient in beauty and rapidly grow old. The upper class, the so-called “intelligenza,” is physically very inferior to the rural population.

The character of the Bulgarians presents a singular contrast to that of the neighbouring nations. Less quick-witted than the Greeks, less prone to idealism than the

Servians, less apt to assimilate the externals of civilization than the Rumanians, they possess in a remarkable degree the qualities of patience, perseverance, and endurance, with the capacity for laborious effort peculiar to an agricultural race. The tenacity and determination with which they pursue their national aims seem likely in the end to give them the advantage over their more brilliant competitors in the struggle for hegemony in the Peninsula. Unlike most southern races, the Bulgarians are reserved, taciturn, phlegmatic, unresponsive, and extremely suspicious of foreigners. The peasants are industrious, peaceable, and orderly; the vendetta, as it exists in Albania, Montenegro, and Macedonia, and the use of the knife in quarrels, so common in southern Europe, are alike unknown. The tranquillity of rural life has, unfortunately, been invaded in recent years by the intrigues of political agitators, and bloodshed is not uncommon at elections. All classes practise thrift bordering on parsimony, and any display of wealth is generally resented. The standard of sexual morality is high, especially in the rural districts; the unfaithful wife is an object of public contempt, and in former times was punished with death. Marriage ceremonies are elaborate and protracted, as is the case in most primitive communities; elopements are frequent, but usually take place with the consent of the parents on both sides, in order to avoid the expense of a regular wedding. The principal amusement on Sundays and holidays is the *chorô* (*χορός*), which is danced on the village green to the strains of the *gaida*, or bagpipe, and the *gusla*, a rudimentary fiddle. The Bulgarians are religious in a simple way, but not fanatical, and the influence of the priesthood is limited. Many ancient superstitions linger among the peasantry, such as the belief in the vampire and the evil eye; witches and necromancers are numerous and are much consulted.

The area of northern Bulgaria is 62,789·10 square kilometres, of eastern Rumelia 32,915·40 sq. kil., of united Bulgaria, 95,704·50 sq. kil. According to the census of 1st January 1893, the population of northern Bulgaria was 2,312,282, or 36·8 per sq. kil.; of eastern Rumelia, 998,431, or 30·33 per sq. kil.; of united Bulgaria, 3,310,713, or 34·59 per sq. kil. Bulgaria thus ranks between Rumania and Portugal in regard to area; between the Netherlands and Switzerland in regard to population: in density of population it may be compared with Spain and Greece. The only previous census of united Bulgaria was taken in 1888: it gave the total population as 3,154,375, or 32·96 per sq. kil. The increase in five years was consequently 156,338, or 1 per cent. per annum. The area and population of the principal subdivisions are shown in the following table:—

Northern Bulgaria, 16 Departments.

	Population.	Per square Kilometre.
Varna	215,213	25·68
Vidin	121,131	38·08
Vratza	151,196	27·04
Küstendil	167,175	31·43
Lovetch	125,829	30·02
Lom	115,393	32·78
Plevna	99,290	36·85
Razgrad	129,531	45·64
Russé	162,589	41·62
Svishtov	94,119	34·48
Sevlievo	93,275	49·14
Silistra	111,830	40·18
Sofia	244,824	43·82
Trn	79,248	36·30
Trnovo	224,163	45·09
Shumen	177,476	36·41

Eastern Rumelia, 6 Departments.

	Population.	Per square Kilometre.
Philippopolis . . .	232,507	33·45
Sliven . . .	170,514	27·36
Stara Zagora . . .	215,483	33·43
Tatar-pazarjik . . .	138,778	24·10
Haskovo . . .	124,985	38·38
Burgas . . .	116,164	19·74

The population of the principal towns in 1893 was as follows:—Sofia, the capital (the Bulgarian name *Sredets* is now little used), 46,593; Philippopolis or Plovdiv (capital of eastern Rumelia), 41,068; Russé (Turkish *Rüstchuk*), 37,174; Varna, 28,174; Trnovo (the ancient Bulgarian capital), 25,295; Gornia Orékhovitzza, 25,013; Sliven (Russian *Slivno*), 23,210; Plevén (Russian *Plevna*), 23,178; Tatar-pazarjik, 22,056; Razgrad, 21,551. The increase of the population of Sofia in the period 1888-93 was 10·62 per cent. yearly; the capital now probably possesses 65,000 inhabitants.

The population according to sex is given as 1,690,626 males and 1,620,087 females, or 51 males to 49 females. A somewhat similar disparity may be observed in the other countries of the Peninsula. Classified according to occupation, 2,447,198 persons, or 73·9 per cent. of the population, are engaged in agriculture; 421,121 in various productive industries; 145,988 in the service of the government or the exercise of liberal professions, and 122,104 in commerce. The population according to race cannot be stated with absolute accuracy, but it is approximately shown by the census of 1893, which gives the various nationalities according to language as follows:—Bulgars, 2,505,326; Turks, 569,728; Rumans, 62,628; Greeks, 58,518; Gypsies (Tziganes), 52,132; Jews (Spanish-speaking), 27,531; Tatars, 16,290; Armenians, 6445; other nationalities, 12,115. The Bulgarian inhabitants of the Peninsula beyond the limits of the Principality may, perhaps, be estimated at 1,500,000 or 1,600,000, and the grand total of the race possibly reaches 4,500,000.

The movement of the population at intervals of five years has been as follows:—

Year.	Marriages.	Births (living).	Still- born.	Deaths.	Natural Increase. ¹
1882	19,795	74,642	300	38,884	35,758
1887	20,089	83,179	144	39,396	43,783
1892	27,553	117,883	321	108,550	14,333
1897	29,227	149,631	858	90,134	59,497

The death-rate shows a tendency to rise. In the five years 1882-86 the mean death-rate was 18·0 per 1000; in 1887-91, 20·4; in 1892-96, 27·0. Infant mortality is high, owing to various causes, especially among the peasants. As the less healthy infants rarely survive, the adult population is in general robust, hardy, and long-lived. The census of 1893 gives 3372 persons of 100 years and upwards. Young men, as a rule, marry before the age of twenty-five, girls before eighteen. The number of illegitimate births is inconsiderable, averaging only 0·12 of the total.

The devastation of the country which followed the Turkish conquest resulted in the extirpation or flight of a large proportion of the Bulgarian inhabitants of the plains, who were replaced by Turkish colonists. The mountainous districts, however, retained their original population and sheltered large numbers of the fugitives. The passage of the Turkish armies during the wars with Austria, Poland, and Russia led to further Bulgarian emigrations. The flight to the Banat, where 22,000 Bulgarians still remain, took place in 1730. At the beginning of the 19th century the majority of the population of the Eastern Rumelian plain was Turkish. The Turkish colony, however, declined, partly in consequence of the drain caused by military service, while the Bulgarian remnant increased, notwithstanding a considerable emigration to Bessarabia before and after the Russo-Turkish campaign of 1828. Efforts were made by the Porte to strengthen the Moslem element by planting colonies of Tatars in 1861 and Circassians in 1864. The advance of the Russian army in 1877-78 caused an enormous exodus of the Turkish population, of which only a small proportion returned to settle permanently. The emigration continued after the conclusion of peace, and is still in progress, notwithstanding the efforts of the Bulgarian Government to arrest it. In twenty years (1879-99), at least 150,000 Turkish peasants left Bulgaria. Much of the land

¹ Excess of births over deaths.

thus abandoned still remains unoccupied. On the other hand, a considerable influx of Bulgarians from Macedonia, the vilayet of Adrianople, Bessarabia, and the Dóbruja took place within the same period, and the inhabitants of the mountain villages show a tendency to migrate into the richer districts of the plains.

The principality is a constitutional monarchy, hereditary in the family of a prince "freely elected by the population and confirmed by the Sublime Porte with the assent of the Powers" (Berlin Treaty, Art. **Government.** III.). According to the constitution of Trnovo, voted by the Assembly of Notables, 29th April 1879, and revised by the Grand Sobranye, 27th May 1893, the princely dignity descends in the direct male line. The prince must profess the Orthodox faith, only the first elected sovereign and his immediate heir being released from this obligation. The legislative power is vested in the prince in conjunction with the national assembly; he is supreme head of the army, supervises the executive power, and represents the country in its foreign relations. In case of a minority or an interregnum, a regency of three persons is appointed. The national representation is embodied in the Sobranye, or ordinary assembly (Bulgarian, *Súbranié*, the Russian form *Sobranye* being usually employed by foreign writers), and the Grand Sobranye, which is convoked in extraordinary circumstances. The former is elected by manhood suffrage, in the proportion of 1 to 20,000 of the population, for a term of five years. Every Bulgarian citizen who can read and write and has completed his thirtieth year is eligible as a deputy. Annual sessions are held from the 27th October to the 27th December. All legislative and financial measures must first be discussed and voted by the Sobranye, and then sanctioned and promulgated by the prince. The Government is responsible to the Sobranye and the ministers, whether deputies or not, attend its sittings. The Grand Sobranye, which is elected in the proportion of 2 to every 20,000 inhabitants, is convoked to elect a new prince, to appoint a regency, to sanction a change in the constitution, or to ratify an alteration in the boundaries of the principality. The executive is entrusted to a cabinet of eight members—the ministers of foreign affairs and religion, finance, justice, public works, the interior, commerce and agriculture, education, and war. Local administration, which is organized on the Belgian model, is under the control of the minister of the interior. The country is divided into twenty-two departments (*okrúg*, pl. *okrúzi*), each administered by a prefect (*uprávitel*), assisted by a departmental council, and eighty-four sub-prefectures (*okolia*), each under a sub-prefect (*okoliiski natchálnik*). The number of these functionaries is excessive and will probably be reduced. The four principal towns have each in addition a prefect of police (*gradonatchálnik*) and one or more commissaries (*pristav*). The gendarmery numbers about 4000 men, or 1 to 825 of the inhabitants. The prefects and sub-prefects have replaced the Turkish *mutessarifs* and *kaimakams*; but the system of municipal government, left untouched by the Turks, descends from primitive times. Every commune (*obshchina*), urban or rural, has its *kmet*, or mayor, and council; the commune is bound to maintain its primary schools, a public library or reading-room, &c.; the *kmet* possesses certain magisterial powers, and in the rural districts he collects the taxes. Each village, as a rule, forms a separate commune, but occasionally two or more villages are grouped together.

The civil and penal codes are, for the most part, based on the Ottoman law. As the principality forms a portion of the Turkish empire, the privileges of the capitulations are guaranteed to foreign subjects (Berlin Treaty, Art. VIII.). **Justice.** The lowest civil and criminal court is that of the village *kmet*, whose jurisdiction is confined to the limits of the commune; no corresponding tribunal exists in the towns. Each sub-prefecture and town has a justice of the peace—in some cases two or more;

the number of these officials is 130. Next follows the departmental tribunal, or court of first instance, which is competent to pronounce sentences of death, penal servitude, and deprivation of civil rights; in specified criminal cases the judges are aided by three assessors chosen by lot from an annually prepared panel of forty-eight persons. Three courts of appeal sit respectively at Sofia, Russé, and Philippopolis. The highest tribunal is the Court of Cassation, sitting at Sofia, and composed of a president, two vice-presidents, and nine judges. There is also a High Court of Audit (*vrkhovna smetna palata*), similar to the French Cour des Comptes. The judges are insufficiently paid and are removable by the Government.

The Orthodox Bulgarian National Church claims to be an indivisible member of the eastern Orthodox communion, and asserts historic continuity with the autocephalous Bulgarian church of the Middle Ages. It was, however, declared schismatic by the Greek Patriarch of Constantinople in 1872, although differing in no point of doctrine from the Greek church. The Exarch, or supreme head of the Bulgarian church, resides at Constantinople; he enjoys the title of "Beatitude" (*negovo Blazhenstvo*), receives an annual subvention of about £6000 from the principality, and exercises jurisdiction over the Bulgarian hierarchy in all parts of the Ottoman empire. The Exarch is elected by the Bulgarian episcopate, the Holy Synod, and a general assembly (*obshiti sbor*), in which the laity is represented; their choice is subject to the Sultan's approval. The occupant of the dignity is titular Metropolitan of a Bulgarian diocese. The organization of the church within the principality was regulated by statute in 1883. There are eleven eparchies or dioceses in the country, each administered by a metropolitan with a diocesan council; one diocese has also a suffragan bishop. Church government is vested in the Holy Synod, consisting of four Metropolitans, which assembles once a year. The laity take part in the election of Metropolitans and parish priests, only the "black clergy," or monks, being eligible for the episcopate. All ecclesiastical appointments are subject to the approval of the Government. There are 2106 parishes (*eporii*) in the principality with 9 archimandrites, 1936 parish priests, and 21 deacons, 78 monasteries with 184 monks, and 12 convents with 346 nuns. The celebrated monastery of Rila possesses a vast estate in the Rilska Planina; its abbot or *hegumen* owns no spiritual superior but the Exarch. Ecclesiastical affairs are under the control of the minister of public worship; the clergy of all denominations are paid by the State, being free, however, to accept fees for baptisms, marriages, burials, the administering of oaths, &c. The census of 1893 gives 2,606,786 persons of the Orthodox faith, 643,258 Mahomedans, 28,307 Jews, 22,617 Catholics, 6643 Gregorian Armenians, 2384 Protestants, and 718 whose religion is not stated. The Greek Orthodox community has four metropolitans dependent on the Patriarchate. The Mahomedan community is rapidly diminishing. The Catholics, who have two bishops, are for the most part the descendants of the medieval Paulicians; they are especially numerous in the neighbourhood of Philippopolis and Svishtov. The Armenians have one bishop. The Protestants are mostly Methodists; since 1857 Bulgaria has been a special field of activity for American Methodist missionaries, who have established an important school at Samakov. The Berlin Treaty (Art. V.), forbids religious disabilities in regard to the enjoyment of civil and political rights, and guarantees the free exercise of all religions.

Education has made astonishing progress since the liberation of the country from Turkish rule. No educational system

existed in the rural districts before 1878; the peasantry was sunk in ignorance, and the older generation is now totally illiterate. In the towns the schools were under the superintendence of the Greek clergy, and Greek was the language of instruction. The first Bulgarian school was founded at Gabrovo in 1835 by the patriot Neophyt. After the Crimean war, Bulgarian schools began to appear in the villages of the Balkans and the south-eastern districts. The children of the wealthier class were generally educated abroad. The American institution of Robert College on the Bosphorus rendered an invaluable service to the newly-created State by providing it with a number of well-educated young men fitted for positions of responsibility. Primary education was declared obligatory from the first, but the scarcity of properly qualified teachers and the lack of all requisites proved serious impediments to educational organization. The Government has made great efforts and incurred heavy expenditure for the spread of education; the satisfactory results obtained are largely due to the keen desire for learning which exists among the people. All the villages now possess "national" (*narodni*) primary schools, maintained by the communes with the aid of a State subvention and supervised by departmental and district inspectors. The State also assists a large number of Turkish primary schools. The penalties for non-attendance are not enforced, and it has been found necessary to close the schools in the rural

districts during the summer, the children being required for labour in the fields. The age for primary instruction is six to twelve years; in 1890, 47·01 per cent. of the boys and 16·11 per cent. of the girls attended the primary schools; in 1898, 85 per cent. of the boys and 40 per cent. of the girls. In the latter year there were 4586 primary schools, of which 3111 were "national" or communal, and 1575 denominational (including 1342 Turkish, 43 Tatar, 42 Greek, 16 Armenian, and 38 Jewish), attended by 348,716 pupils, representing a proportion of 10·57 per hundred inhabitants. In 1888 only 327,766 persons, or 11 per cent. of the population, were literate; in 1893 the proportion rose to 19·88 per cent.; in 1897 of 25,620 young men presenting themselves for military service, 12,119, or 47·27 per cent., were literate. In the system of secondary education the distinction between the classical and "real" or special courses of study is maintained as in most European countries; there are 121 secondary schools (43 for boys, 38 for girls, and 40 mixed), for the most part with 3 classes, and 16 gymnasias (9 for boys and 7 for girls) with 7 classes. In addition to these there are 6 technical and 3 agricultural schools; 5 of pedagogy, 1 theological, 1 commercial, 1 of forestry, 1 of design, 1 for surgeons' assistants, and a large military school at Sofia. Government aid is given to students of limited means, both for secondary education and the completion of their studies abroad. The university of Sofia, of which the organization is incomplete, is still known as the high school (*vishe uchilishte*); it possesses a staff of 17 professors and 25 lecturers. The number of students is 288. The progress of learning has, unfortunately, tended to create a distaste for agricultural and industrial pursuits; the daily increasing number of candidates for State employment swells the ranks of the various political parties, and the country is threatened with the growth of an educated proletariat.

At the outset of its career the principality was practically unencumbered with any debt, external or internal. The stipulations of the Berlin Treaty (Art. IX.), with regard to the payment of a tribute to the Sultan and the assumption of an "equitable proportion" of the Ottoman debt, were never carried into effect. In 1883 the claim of Russia (under Art. XX. of the Treaty) for the expenses of the occupation, was fixed at 26,545,625 fr., payable in annual instalments of 2,100,000 fr. The union with Eastern Rumelia in 1885 entailed liability for the obligations of that province, consisting of an annual tribute to Turkey of 2,951,000 fr., and a loan of 3,375,000 fr., contracted with the Imperial Ottoman Bank. In 1888 the purchase of the Varna-Russé railway for 46,777,500 fr., was effected by the issue to the vendors of treasury bonds at 6 per cent. In 1889 a loan of 30,000,000 fr., bearing 6 per cent. interest, was contracted with the Vienna Länderbank and Bankverein at 85½. In 1892 a further 6 per cent loan of 142,780,000 fr. in six options was contracted with the Länderbank at 83, 86, and 89, of which 126,480,000 fr. had been issued up to 31st October 1899, together with an advance of 7,000,000 fr. In August 1899 the national debt stood as follows: Outstanding amount of the above-mentioned loans, 184,898,000 fr.; advanced by the Länderbank (June 1889), 7,000,000 fr.; due to Russia, 9,718,296 fr.; arrears of the Eastern Rumelian tribute, 5,451,900 fr.: total external debt 207,068,196 fr. The total internal debt at the same date was about 33,100,000. The entire national liabilities were, therefore, approximately 240,168,196 fr. The Eastern Rumelian tribute and the rent of the Vakarel-Belovo railway, if capitalized at 6 per cent., would represent a further sum of 50,919,100 fr. On the 1st Jan. 1900 a 6 per cent. guaranteed loan of 25,000,000 fr. at 89, repayable in 5 years, was contracted with a group of foreign banks in order to meet immediate liabilities. The national debt is not disproportionately great in comparison with annual revenue. After the union with Eastern Rumelia the budget receipts increased from 40,893,262 leva (= francs) in 1886 to 101,872,280 leva in 1894; the estimated revenue for 1900 was 83,827,863 leva, of which 35,294,900 were derived from direct, 29,901,000 from indirect taxation; the estimated expenditure was 83,270,370 leva, the principal items being: public debt, 24,646,849; army, 20,773,432; education, 8,114,526; interior, 7,238,880; public works, 5,863,176 leva. In 1895 direct taxation, which pressed heavily on the agricultural class, was diminished, and indirect taxation (import duties and excise) considerably increased. The former is now 10·22 leva per head of the population, the latter 9·65 leva. The financial difficulties into which the country has recently fallen are to be attributed, not to excessive indebtedness, but to heavy outlay on public works, the army, and education, and to the maintenance of an unnecessary number of officials; the economic situation has been aggravated by a succession of bad harvests. The expenditure on public works, however, will ultimately prove remunerative. The war budget during ten years (1888-97) absorbed the large sum of 275,832,017 leva, or 35·77 per cent. of the whole national income within that period. Expenditure on education, which was 2,648,154 leva in 1888, reached 9,313,137 leva in 1897. The excess of expenditure over actual receipts (the

latter including the proceeds of the various loans), from the creation of the principality to the beginning of the financial year 1896, was 55,823,574 leva. Arrears of taxation are considerable: the outstanding amount at the beginning of 1897 was 16,259,340 leva.

The organization of the military forces of the principality was undertaken by Russian officers, who for a period of six years (1879-85) occupied all the higher posts in the army. In Eastern Rumelia during the same period the "militia" was instructed by foreign officers; after the union it was merged in the Bulgarian army. The present organization is based on the law of 27th December 1891. The army consists of: (1) the active or field army (*deistvuyusha armia*) divided into (i.) the active army; (ii.) the active army reserve; (2) the reserve army (*reservna armia*); (3) the *oplitchenie* or militia: the two former may operate outside the principality, the latter only within the frontier for purposes of defence. In time of peace the active army (i.) alone is on a permanent footing. The peace strength in 1899 was 2154 officers, 38,987 men, and 5764 horses, the active army being composed of 6 divisions of infantry, 5 regiments of cavalry, 7 regiments of artillery, and 1 regiment of engineers, together with artillery garrisons, &c. The total effective in time of war is 152,938 officers and men, with 84,000 officers and men of the reserve army; grand total 236,938, exclusive of the *oplitchenie*, which as yet is without equipment. Military service is obligatory, but Moslems may claim exemption on payment of £20; the age of recruitment in time of peace is nineteen, in time of war eighteen. Each conscript serves two years in the infantry and subsequently eight years in the active reserve or three years in the other corps and six years in the active reserve; he is then liable to seven years' service in the reserve army and finally passes into the *oplitchenie*. The Bulgarian peasant makes an admirable soldier—courageous, obedient, persevering, and inured to hardship; the officers are painstaking and devoted to their duties. The hours of drill, &c., are perhaps excessive, but the results are satisfactory. The cavalry is the least efficient branch of the service. Under the new arrangements for mobilization the reserve army will be organized in twelve regiments corresponding with those of the active army. The active army is furnished with the '315' Mannlicher magazine rifle, the reserve with the Mannlicher and Berdan; the artillery mainly consists of 8·7- and 7·5-cm. Krupp guns and 12-cm. Krupp howitzers. The army is locally distributed in six divisions, with headquarters at Sofia, Philippopolis, Sliven, Shumen, Russé, and Vidin. The last-named is the only fortified town, but defensive works are in progress at Sofia and Slivnitsa, and an entrenched camp has been formed at Belogradchik. The naval force of the principality consists of a flotilla stationed at Russé and Varna. It is composed of 1 prince's yacht (800 tons), 3 gunboats, 3 torpedo boats, and 10 other small vessels, with a complement of 69 officers and 488 men.

Agriculture, the main source of wealth to the country, is still in an extremely primitive condition. The ignorance and conservatism of the peasantry, the habits engendered by wide-spread insecurity and the fear of official rapacity under Turkish rule, insufficiency of communications, want of capital, and in some districts sparsity of population, have all tended to retard the development of this most important industry. The peasants cling to traditional usage, and look with suspicion on modern implements and new-fangled modes of production. The plough is of a primeval type, rotation of crops is only partially practised, and the use of manure is almost unknown. The Government has sedulously endeavoured to introduce more enlightened methods and

ideas by the establishment of agricultural schools, the appointment of itinerant professors and inspectors, the distribution of better kinds of seeds, improved implements, &c. Efforts have latterly been made to improve the breeds of native cattle and horses, and stallions have been introduced from Hungary and distributed throughout the country. Oxen and buffaloes are the principal animals of draught; the buffalo, which was apparently introduced from Asia in remote times, is much prized by the peasants for its patience and strength; it is, however, somewhat delicate and requires much care. In the eastern districts camels are also employed. The Bulgarian horses are small, but remarkably hardy, wiry, and intelligent; they are as a rule unfitted for draught and cavalry purposes. The best sheep are found in the district of Karnobat in Eastern Rumelia. The number of goats in the country has considerably declined in recent years, the Government having imposed a relatively high tax on these animals owing to the injury they inflict on young trees. The average price of oxen is £5 each, draught oxen £12 the pair, buffaloes £14 the pair, cows £2, horses £6, sheep, 7s., goats 5s. each. The principal cereals are wheat, maize, rye, barley, oats, and millet. The cultivation of maize is increasing in the Danubian and eastern districts. Rice-fields are found in the neighbourhood of Philippopolis. Cereals represent about 80 per cent. of the total exports. Besides grain, Bulgaria produces wine, tobacco, attar of roses, silk, and cotton. The quality of the grape is excellent, and could the peasants be induced to abandon their highly primitive mode of wine-making the Bulgarian vintages would rank among the best European growths. The tobacco, which is not of the highest quality, is grown in considerable quantities for home consumption, and only an insignificant amount is exported. The best tobacco-fields in Bulgaria are on the northern slopes of Rhodope, but the southern declivity, which produces the famous Kavala growth, is more adapted to the cultivation of the plant. The rose-fields of Kazanlyk and Karlovo lie in a sheltered valley between the Balkans and the parallel chains of the Sredna Gora and Karaja Dag. About 6000 pounds of the rose-essence are annually exported, valuing from £12 to £14 per pound. Sericulture, formerly an important industry, has declined owing to disease among the silkworms, but efforts are being made to revive it with promise of success. Cotton is grown in the southern districts of Eastern Rumelia.

Peasant proprietorship is universal, the small freeholds averaging about 18 acres each. There are scarcely any large estates owned by individuals, but some of the monasteries possess considerable domains. The large *tschifliks*, or farms, formerly belonging to Turkish landowners, have been divided among the peasants. The rural proprietors enjoy the right of pasturing their cattle on the common lands belonging to each village, and of cutting wood in the State forests. They live in a condition of rude comfort, and poverty is practically unknown, except in the towns. A peculiarly interesting feature in Bulgarian agricultural life is the *zadruga*, or house-community, a patriarchal institution apparently dating from prehistoric times. Family groups, sometimes numbering several dozen persons, dwell together on a farm in the observance of strictly communistic principles. The association is ruled by a house-father (*domakin, stareishina*), and a house-mother (*domakinja*), who assign to the members their respective tasks. In addition to the farm work the members often practise various trades, the proceeds of which are paid into the general treasury. The community sometimes includes a priest, whose fees for baptisms, &c., augment the common fund. The national aptitude for combination is also displayed in the associations of market gardeners (*gradinarski druzhini, taitfi*), who in the spring leave their native districts for the purpose of cultivating gardens in the neighbourhood of some town, either in Bulgaria or abroad, returning in the autumn, when they divide the profits of the enterprise; the number of persons annually thus engaged probably exceeds 10,000.

The development of manufacturing enterprise on a large scale has been retarded by want of capital. The principal

establishments for the native manufactures of *aba* and *shayak* (rough and fine homespuns), and of *gaitan* (braided embroidery) are at Sliven and Gabrovo respectively. The Bulgarian homespuns, which are made of pure wool, are of admirable quality.

The exportation of textiles is almost exclusively to Turkey: value in 1896, £104,046; in 1897, £116,250; in 1898, £144,726. Unfortunately the home demand for native fabrics is diminishing owing to foreign competition; the smaller textile industries are declining, and the picturesque, durable, and comfortable costume of the country is giving way to cheap ready-made clothing imported from Austria. The Government has endeavoured to stimulate the home industry by ordering all persons in its employment to wear the native cloth, and the army is supplied almost exclusively by the factories at Sliven. A great number of small distilleries exist throughout the country; there are breweries in all the principal towns, tanneries at Sevlievo, Varna, &c., numerous corn-mills worked by water and steam, and saw-mills, turned by the mountain torrents, in the Balkans and Rhodope. A certain amount of foreign capital has recently been invested in industrial enterprises; the most notable are a sugar-refinery in the neighbourhood of Sofia, and a cotton-spinning mill at Varna, on which an English company has expended about £60,000.

The usages of internal commerce have been considerably modified by the development of communications. The primitive system of barter in kind still exists in the rural districts, but is gradually disappearing. The great fairs (*panairi*, *πανηγύρεις*) held at Eski-Jumaiia, Hajioulouparjick, and other towns, which formerly attracted multitudes of foreigners as well as natives, have lost much of their importance; a considerable amount of business, however, is still transacted at these gatherings, of which ninety-seven were held in 1898. The principal seats of the export trade are Varna, Burgas, and Balchik on the Black Sea, and Svishtov, Russé, Nikopolis, Silistra, Rakhovo, and Vidin on the Danube. The chief centres of distribution for imports are Varna, Sofia, Russé, Philippopolis, and Burgas. About 10 per cent. of the exports passes over the Turkish frontier, but the Government is making great efforts to divert the trade to Varna and Burgas, and important harbour works have been undertaken at both these ports. In 1887 the total value of Bulgarian foreign commerce was £4,419,589. The following table gives the values for the six years ending 1899. The great fluctuations in the exports are due to the variations of the harvest, on which the prosperity of the country practically depends:—

Year.	Exports.	Imports.	Total.
	£	£	£
1894	2,914,027	3,969,168	6,883,195
1895	3,107,422	2,760,812	5,868,235
1896	4,349,599	3,061,211	7,410,810
1897	2,391,620	3,859,770	5,751,390
1898	2,661,480	2,909,210	5,570,690
1899	2,138,684	2,407,123	4,545,807

The principal exports are cereals, live stock, homespuns, hides, cheese, eggs, attar of roses. Exports to the United Kingdom in 1898 were valued at £413,668, in 1899 at £394,954. The principal imports are textiles, metal goods, colonial goods, implements, furniture, leather, petroleum. Imports from the United Kingdom in 1898, £695,345; in 1899, £493,736. The following is the average percentage of imports from various countries in ten years (1888-97)—from Austria-Hungary, 33·32; United Kingdom, 24·09; Turkey, 12·70; Germany, 9·53; Russia, 5·18; France, 4·56; Italy, 2·36; Belgium, 2·26; other countries, 6·0.

The National Bank, a State institution with a capital of 10,000,000 leva, has its central establishment at Sofia and

branches at Philippopolis, Russé, Varna, and Trnovo. Besides conducting the ordinary banking operations, it issues loans on mortgage. There are several private banks in the country. The Imperial Ottoman Bank and the Industrial Bank of Kiev have branches at Philippopolis and Sofia respectively. The agricultural chests, founded by Midhat Pasha in 1863, and reorganized in 1894, have done much to rescue the peasantry from the hands of usurers. They serve as treasuries for the local administration, accept deposits at interest, and make loans to the peasants on mortgage or the security of two solvent landowners at 8 per cent. Their capital in 1887 was 14,231,440 leva; in 1898, 30,657,360 leva. The post-office savings banks, established 1896, have a capital of 3,403,818 leva. There are over 200 registered provident societies in the country. The legal rate of interest is 10 per cent., but much higher rates are not uncommon.

Bulgaria, like the neighbouring states of the Peninsula, has adopted the metric system. Turkish weights and measures, however, are still largely employed in local commerce. The monetary unit is the *lev*, or "lion" (pl. *leva*), nominally equal to the franc, with its submultiple the *stotinka* (pl. *-ki*), or centime. The coinage consists of nickel and bronze coins (2½, 5, 10, and 20 *stotinki*) and silver coins (50 *stotinki*; 1, 2, and 5 *leva*). A gold coinage was struck in 1893 with pieces corresponding to those of the Latin Union. The Turkish pound and foreign gold coins are also in general circulation. The National Bank issues notes for 5, 10, 20, 50, and 100 *leva*, formerly payable in gold, but since November 1899 payable in silver with the agio. Notes payable in silver are also issued. The gold premium has considerably increased in recent years.

In 1878 the only railway in Bulgaria was the Russé-Varna line (221 kilometres) constructed by an English company in 1867. In Eastern Rumelia the line from Sarambey to Philippopolis and the Turkish frontier (196 kilometres), with a branch to Yamboli (106 kilometres) had been built by Baron Hirsch in 1873; it is now worked by the Oriental Railways Company. The construction of a railway from the Servian frontier at Tzaribrod to the Eastern Rumelian frontier at Vakarel was imposed on the principality by the Berlin Treaty, but political difficulties intervened, and the line, which touches Sofia, was not completed till 1888. In that year the Bulgarian Government seized the short connecting line Vakarel-Belovo belonging to Turkey, and railway communication between Constantinople and the western capitals was established. Since that time great progress has been made in railway construction. In 1888, 384 kilometres of State railways were open to traffic; in 1893, 493 kilometres; in 1898, 681 kilometres; and in December 1899, 1250 kilometres. All these lines are worked by the State, and, with the exception of the Vakarel-Belovo line (46 kilometres), are its property. The completion of the important line Radomir-Sofia-Shumen (November 1899) opened up the rich agricultural district between the Balkans and the Danube. Branches to Samovit and Russé establish connexion with the Rumanian railway system on the opposite side of the river. It is hoped, with the consent of the Turkish Government, to extend the line Sofia-Radomir to Uskub, and thus to secure a direct route to Salonika and the *Ægean*.

The total receipts of the State railways in 1898 were 5,103,554 leva; working expenses, 5,598,053 leva. The expenditure on construction and purchase of railways and rolling stock up to the year 1897 is given as 114,433,522 leva. Road communication is still in an unsatisfactory condition. Roads are divided into three classes: "State roads" or main highways, maintained by the Government; "district roads" maintained by the district councils; and "inter-village roads" (*mezhdunarodni shoseta*), maintained by the communes. Of the first there are 4200 kilometres, of the second, 3515 kilometres. Repairs are effected by the *corvée* system with requisitions of material; 1086 kilometres of new roads are now in construction. There are no canals, and inland navigation is confined to the Danube. The Austrian Donaudampschiffahrtsgesellschaft and the Russian "Gagarine" steamship company compete for the river traffic; the grain trade is largely served by steamers belonging to Greek merchants. The coasting trade on the Black Sea is carried on by a Bulgarian steamship company; the steamers of the Austrian Lloyd, and other foreign companies call at Varna, and occasionally at Burgas.

The great development of postal and telegraphic communication attests the advance of civilization. The number of letters posted in 1886 was 1,468,494; in 1896, 4,370,216; in 1898, 5,869,034. The number of telegrams in 1886 was 527,556; in 1896, 1,082,326; in 1898, 1,099,163. Receipts of posts and telegraphs were in 1886, 1,024,386 leva; in 1896, 2,327,660 leva; in 1898, 2,900,732 leva. In 1898 there were 5244 kilometres of telegraph lines and 87 kilometres of telephones.

2. POLITICAL HISTORY.

The ancient Thraco-Illyrian race which inhabited the district between the Danube and the Ægean was expelled, or more probably absorbed, by the great Slavonic immigration which took place at various intervals between the end of the 3rd century after Christ and the beginning of the 6th. The numerous tumuli which are found in all parts of the country (see Herodotus, v. 8) and some stone tablets with bas-reliefs remain as monuments of the aboriginal population; and certain structural peculiarities, which are common to the Bulgarian and Rumanian languages, may conceivably be traced to the influence of the primitive Illyrian speech, now represented by the Albanian. The Slavs, an agricultural people, were governed, even in those remote times, by the democratic local institutions to which they are still attached; they possessed no national leaders or central organization, and their only political unit was the *pleme*, or tribe. They were considerably influenced by contact with Roman civilization. It was reserved for a foreign race, altogether distinct in origin, religion, and customs, to give unity and coherence to the scattered Slavonic groups, and to weld them into a compact and powerful State which for some centuries played an important part in the history of eastern Europe and threatened the existence of the Byzantine empire.

The Bulgars, a Turanian race akin to the Tatars, Huns, Avars, Petchenegs, and Finns, made their appearance on the banks of the Pruth in the latter part of the 7th century. They were a horde of wild horsemen, fierce and barbarous, practising polygamy, and governed despotically by their khans and boyars (or boyars). Their original abode was the tract between the Ural mountains and the Volga, where the kingdom of Great (or Black) Bolgary existed down to the 13th century. In 679, under their khan Asparukh (or Ispirikh), they crossed the Danube, and, after subjugating the Slavonic population of Moesia, advanced to the gates of Constantinople and Salonika. The Byzantine emperors were compelled to cede to them the province of Moesia and to pay them an annual tribute. The invading horde was not numerous, and during the next two centuries it became gradually merged in the Slavonic population. Like the Franks in Gaul the Bulgars gave their name and a political organization to the more civilized race which they conquered, but adopted its language, customs, and local institutions. Not a trace of the Ugrian or Finnish element is to be found in the Bulgarian speech. This complete assimilation of a conquering race may be illustrated by many parallels.

The history of the early Bulgarian dynasties is little else than a record of continuous conflicts with the Byzantine emperors. The tribute first imposed on the Greeks by Asparukh was again exacted by Kardam (791-797) and Krum (802-815), a sovereign noted alike for his cruelty and his military and political capacity. Under his rule the Bulgarian realm extended from the Carpathians to the neighbourhood of Adrianople; Serdica (the present Sofia) was taken, and the valley of the Struma conquered. Prêslav, the Bulgarian capital, was attacked and burnt by the emperor Nikephoros, but the Greek army on its return was annihilated in one of the Balkan passes; the emperor was slain, and his skull was converted by Krum into a goblet. The reign of Boris (852-884) is memorable for the introduction of Christianity into Bulgaria. Two monks of Salonika, SS. Cyril and Methodius, are generally revered as the national apostles; the scene of their labours, however, was among the Slavs of Moravia, and the Bulgars were evangelized by their disciples. Boris, finding himself surrounded by Christian states, decided from political motives to abandon paganism. He was baptized in 864, the emperor Michael III. acting as his sponsor. It was at this time that the controversies broke out which ended in the schism between the Latin and Orthodox communities. Boris long wavered between Constantinople and Rome, but the refusal of the Pope to recognize an autocephalous Bulgarian church determined him to offer his allegiance to the Greek Patriarch. The

decision was fraught with momentous consequences for the future of the race. The nation altered its religion in obedience to its sovereign, and some of the boyars who resisted the change paid with their lives for their fidelity to the ancient belief. The independence of the Bulgarian church was recognized by the Patriarchate, a fact much dwelt upon in recent controversies. The Bulgarian primates subsequently received the title of patriarch; their see was transferred from Prêslav to Sofia, Voden, and Prespa successively, and finally to Okhrida.

The national power reached its zenith under Simeon (893-927), a monarch distinguished in the arts of war and peace. In his reign, says Gibbon, "Bulgaria assumed a rank among the civilized powers of the earth." His dominions extended from the Black Sea to the Adriatic, and from the borders of Thessaly to the Save and the Carpathians. Having become the most powerful monarch in Eastern Europe, Simeon assumed the style of "Emperor and Autocrat of all the Bulgars and Greeks" (*tsar i samodrzhetz vsëm Bilgarom i Grikom*), a title which was recognized by Pope Formosus. During the latter years of his reign, which were spent in peace, his people made great progress in civilization, literature flourished, and Prêslav, according to contemporary chroniclers, rivalled Constantinople in magnificence. After the death of Simeon the Bulgarian power declined owing to internal dissensions; the land was distracted by the Bogomile heresy, and a separate or western empire, including Albania and Macedonia, was founded at Okhrida by Shishman, a boyar from Trnovo. A notable event took place in 967, when the Russians, under Sviatoslav, made their first appearance in Bulgaria. The Bulgarian tsar, Boris II., with the aid of the emperor John Zimisces, expelled the invaders, but the Greeks took advantage of their victory to dethrone Boris, and the first Bulgarian empire thus came to an end after an existence of three centuries. The empire at Okhrida, however, rose to considerable importance under Samuel, the son of Shishman (976-1014), who conquered the greater part of the Peninsula, and ruled from the Danube to the Morea. After a series of campaigns this redoubtable warrior was defeated at Belasitza by the emperor Basil II., surnamed Bulgaroktonos, who put out the eyes of 15,000 prisoners taken in the fight, and sent them into the camp of his adversary. The Bulgarian tsar was so overpowered by the spectacle that he died of grief. A few years later his dynasty finally disappeared, and for more than a century and a half (1018-1186) the Bulgarian race remained subject to the Byzantine emperors.

In 1186, after a general insurrection under the brothers Ivan and Peter Asên of Trnovo, who claimed descent from the dynasty of the Shishmanovtzi, the nation recovered its independence, and Ivan Asên assumed the title of "Tsar of the Bulgars and Greeks." The seat of the second empire was at Trnovo, which the Bulgarians regard as the historic capital of their race. Kaloyan, the third of the Asên monarchs, extended his dominions to Belgrade, Nish, and Skopje (Uskub); he acknowledged the spiritual supremacy of the Pope, and received the royal crown from a papal legate. The greatest of all Bulgarian rulers was Ivan Asên II. (1218-1241), a man of humane and enlightened character. After a series of victorious campaigns he established his sway over Albania, Epirus, Macedonia, and Thrace, and governed his wide dominions with justice, wisdom, and moderation. In his time the nation attained a prosperity hitherto unknown: commerce, the arts, and literature flourished; Trnovo, the capital, was enlarged and embellished, and great numbers of churches and monasteries were founded or endowed. The dynasty of the Asêns became extinct in 1257, and a period of decadence began. Two other dynasties, both of Kuman origin, followed—the Terterovtzi, who ruled at Trnovo, and the Shishmanovtzi, who founded an independent State at Vidin, but afterwards reigned in the national capital. Eventually, on the 28th June 1330, a day commemorated with sorrow in Bulgaria, Tsar Michael Shishman was defeated and slain by the Servians, under Stephen Urosh III., at the battle of Velbûzd (Küstendil). Bulgaria, though still retaining its native rulers, now became subject to Serbia, and formed part of the short-lived empire of Stephen Dushan (1331-1355). The Servian hegemony vanished after the death of Dushan, and the Christian races of the Peninsula, distracted by the quarrels of their petty princes, fell an easy prey to the advancing might of the Moslem invader.

In 1340 the Turks had begun to ravage the valley of the Maritza; in 1362 they captured Philippopolis, and in 1382 Sofia. In 1366 Ivan Shishman III., the last Bulgarian tsar, was compelled to declare himself the vassal of the Sultan Murad I., and to send his sister to the harem of the conqueror. In 1389 the rout of the Servians, Bosnians, and Croats on the famous field of Kossovo decided the fate of the Peninsula. Shortly afterwards Ivan Shishman was attacked by the Turks; and Trnovo, after a siege of three months, was captured, sacked, and burnt in 1393. The fate of the last Bulgarian sovereign is unknown: the national legend represents him as perishing in a battle near Samakov. Vidin, where Ivan's brother,

Strazhimir, had established himself, was taken in 1396, and with its fall the last remnant of Bulgarian independence disappeared.

The five centuries of Turkish rule (1396-1878) form a dark epoch in Bulgarian history. The invaders carried fire and sword through the land; towns, villages, and monasteries were sacked and destroyed, and whole districts were converted into desolate wastes. The inhabitants of the plains fled to the mountains, where they founded new settlements. Many of the nobles embraced the creed of Islam, and were liberally rewarded for their apostasy; others, together with numbers of the priests and people, took refuge across the Danube. All the regions formerly ruled by the Bulgarian tsars, including Macedonia and Thrace, were placed under the administration of a governor-general, styled the beylerbey of Rum-ili, residing at Sofia; Bulgaria proper was divided into the sanjaks of Sofia, Nikopolis, Vidin, Silistra, and Kustendil. Only a small proportion of the people followed the example of the boyars in abandoning Christianity; the conversion of the isolated communities now represented by the Pomaks took place at various intervals during the next three centuries. A new kind of feudal system replaced that of the boyars, and fiefs or *sputniks* were conferred on the Ottoman chiefs and the renegade Bulgarian nobles. The Christian population was subjected to heavy imposts, the principal being the *haratch*, or capitation-tax, paid to the imperial treasury, and the tithe on agricultural produce, which was collected by the feudal lord. Among the most cruel forms of oppression was the requisitioning of young boys between the ages of ten and twelve, who were sent to Constantinople as recruits for the corps of janissaries. Notwithstanding the horrors which attended the Ottoman conquest, the condition of the peasantry during the first three centuries of Turkish government was scarcely worse than it had been under the tyrannical rule of the boyars. The contemptuous indifference with which the Turks regarded the Christian *rayas* was not altogether to the disadvantage of the subject race. Military service was not exacted from the Christians, no systematic effort was made to extinguish either their religion or their language, and within certain limits they were allowed to retain their ancient local administration and the jurisdiction of their clergy in regard to inheritances and family affairs. At the time of the conquest certain towns and villages, known as the *voynitchki sela*, obtained important privileges which were not infringed till the 18th century; on condition of furnishing contingents to the Turkish army or grooms for the Sultan's horses they obtained exemption from most of the taxes and complete self-government under their *voivodi* or chiefs. Some of them, such as Koprivshtitza in the Sredna Gora, attained great prosperity, which has somewhat declined since the establishment of the principality. While the Ottoman power was at its height the lot of the subject-races was far less intolerable than during the period of decadence, which began with the unsuccessful siege of Vienna in 1683. Their rights and privileges were respected, the law was enforced, commerce prospered, good roads were constructed, and the great caravans of the Ragusan merchants traversed the country. Down to the end of the 18th century there appears to have been only one serious attempt at revolt—that occasioned by the advance of Prince Sigismund Bathory into Wallachia in 1595. A kind of guerilla warfare was, however, maintained in the mountains by the *haiduti*, or outlaws, whose exploits, like those of the Greek *klephts*, have been highly idealized in the popular folk-lore. As the power of the Sultans declined anarchy spread through the Peninsula. In the earlier decades of the 18th century the Bulgarians suffered terribly from the ravages of the Turkish armies passing through the land during the wars with Austria. Towards its close their condition became even worse owing to the horrors perpetrated by the Krjalis, or troops of disbanded soldiers and desperadoes, who, in defiance of the Turkish authorities, roamed through the country, supporting themselves by plunder and committing every conceivable atrocity. After the peace of Belgrade (1737), by which Austria lost her conquests in the Peninsula, the Servians and Bulgarians began to look to Russia for deliverance, and their hopes were encouraged by the treaty of Kainarji, under which the Empress Catherine obtained the protectorate of the orthodox Christians in the Turkish empire. In 1794 Pasvan-oglu, one of the chiefs of the Krjalis, established himself as an independent sovereign at Vidin, putting to flight three large Turkish armies which were despatched against him. This adventurer possessed many remarkable qualities. He adorned Vidin with handsome buildings, maintained order, levied taxes, and issued a separate coinage. He died in 1807. The memoirs of Sofronii, bishop of Vratza, present a vivid picture of the condition of Bulgaria at this time. "My diocese," he writes, "was laid desolate; the villages disappeared—they had been burnt by the Krjalis and Pasvan's brigands; the inhabitants were scattered far and wide over Wallachia and other lands."

At the beginning of the 19th century the existence of the Bulgarian race was almost unknown in

Europe even to students of Slavonic literature. Disheartened by ages of oppression, isolated from Christendom by their geographical position, and cowed by the proximity of Constantinople, the Bulgarians took no collective part in the insurrectionary movement which resulted in the liberation of Servia and Greece. The Russian invasions of 1810 and 1828 only added to their sufferings, and great numbers of fugitives took refuge in Bessarabia, annexed by Russia under the treaty of Bucarest. But the long-dormant national spirit now began to awake under the influence of a literary revival. The precursors of the movement were Paisii, a monk of Mount Athos, who wrote a history of the Bulgarian tsars and saints (1762), and Bishop Sofronii, whose memoirs have been already mentioned. After 1824 several works written in modern Bulgarian began to appear, but the most important step was the foundation, in 1835, of the first Bulgarian school at Gabrovo. Within ten years at least 53 Bulgarian schools came into existence, and five Bulgarian printing-presses were at work. The literary movement led the way to a reaction against the influence and authority of the Greek clergy. The spiritual domination of the Greek Patriarchate had tended more effectually than the temporal power of the Turks to the effacement of Bulgarian nationality. After the conquest of the Peninsula the Greek Patriarch became the representative at the Sublime Porte of the *Rum-milleti*, the Roman nation, in which all the Christian nationalities were comprised. The independent patriarchate of Trnovo was suppressed; that of Ohrida was subsequently Hellenized. The Phanariot clergy—unscrupulous, rapacious, and corrupt—succeeded in monopolizing the higher ecclesiastical appointments and filled the parishes with Greek priests, whose schools, in which Greek was exclusively taught, were the only means of instruction open to the population. By degrees Greek became the language of the upper classes in all the Bulgarian towns, the Bulgarian language was written in Greek characters, and the illiterate peasants, though speaking the vernacular, called themselves Greeks. The Slavonic liturgy was suppressed in favour of the Greek, and in many places the old Bulgarian manuscripts, images, testaments, and missals were committed to the flames. The patriots of the literary movement, recognizing in the Patriarchate the most determined foe to a national revival, directed all their efforts to the abolition of Greek ecclesiastical ascendancy and the restoration of the Bulgarian autonomous church. Some of the leaders went so far as to open negotiations with Rome, and an archbishop of the Uniate Bulgarian church was nominated by the Pope. The struggle was prosecuted with the utmost tenacity for forty years. Incessant protests and memorials were addressed to the Porte, and every effort was made to undermine the position of the Greek bishops, some of whom were compelled to abandon their sees. At the same time no pains were spared to diffuse education and to stimulate the national sentiment. Various insurrectionary movements were attempted by the patriots Rakovski, Panayot Khitoff, Haji Dimitr, Stephen Karaja, and others, but received little support from the mass of the people. The recognition of Bulgarian nationality was won by the pen, not the sword. The Patriarchate at length found it necessary to offer some concessions, but these appeared illusory to the Bulgarians, and long and acrimonious discussions followed. Eventually the Turkish Government intervened, and on the 28th February 1870 a firman was issued establishing the Bulgarian Exarchate, with jurisdiction over fifteen dioceses, including Nish, Pirot, and Veles; the other dioceses in dispute were to be added to these in case two-thirds of the Christian population so desired. The election of the first exarch was

*National
revival.*

delayed till February 1872, owing to the opposition of the Patriarch, who immediately afterwards excommunicated the new head of the Bulgarian church and all his followers. The official recognition now acquired tended to consolidate the Bulgarian nation and to prepare it for the political developments which were soon to follow. A great educational activity at once displayed itself in all the districts subjected to the new ecclesiastical power.

Under the enlightened administration of Midhat Pasha (1864-68) Bulgaria enjoyed comparative prosperity, but that remarkable man is not remembered with gratitude by the people owing to the severity with which he repressed insurrectionary movements. In 1861, 12,000 Crimean Tatars, and in 1864 a still larger number of Circassians from the Caucasus, were settled by the Turkish Government on lands taken without compensation from the Bulgarian peasants. The Circassians, a lawless race of mountaineers, proved a veritable scourge to the population in their neighbourhood. In 1875 the insurrection in Bosnia and Herzegovina produced immense excitement throughout the Peninsula. The fanaticism of the Moslems was aroused, and the Bulgarians, fearing a general massacre of Christians, endeavoured to anticipate the blow by organizing a general revolt. The rising, which broke out prematurely at Koprivshitzza and Panagurishtë in May 1876, was mainly confined to the sanjak of Philippopolis. Bands of bashi-bazouks were let loose throughout the district by the Turkish authorities, the Pomaks, or Moslem Bulgarians, and the Circassian colonists were called to arms, and a succession of horrors followed to which a parallel can scarcely be found in the history of the Middle Ages. The principal scenes of massacre were Panagurishtë, Perushtitza, Bratzigovo, and Batak; at the last-named town, according to an official British report, 5000 men, women, and children were put to the sword by the Pomaks under Achmet Aga, who was decorated by the Sultan for this exploit. Altogether some 15,000 persons were massacred in the district of Philippopolis, and fifty-eight villages and five monasteries were destroyed. Isolated risings which took place on the northern side of the Balkans were crushed with similar barbarity. These atrocities, which were first made known by an English journalist and an American consular official, were denounced by Gladstone in a celebrated pamphlet which aroused the indignation of Europe. The Great Powers remained inactive, but Serbia declared war in the following month, and her army was joined by 2000 Bulgarian volunteers. A conference of the representatives of the Powers, held at Constantinople towards the end of the year, proposed, among other reforms, the organization of the Bulgarian provinces, including the greater part of Macedonia, in two vilayets under Christian governors, with popular representation. These recommendations were practically set aside by the Porte, and in April 1877 Russia declared war. In the campaign which followed the Bulgarian volunteer contingent in the Russian army played an honourable part; it accompanied Gourko's advance over the Balkans, behaved with great bravery at Stara Zagora, where it lost heavily, and rendered valuable services in the defence of Shipka.

The victorious advance of the Russian army to Constantinople was followed by the treaty of San Stefano (3rd March 1878), which realized almost to the full the national aspirations of the Bulgarian race. All the provinces of European Turkey in which the Bulgarian element predominated were now included in an autonomous principality, which extended from the Black Sea to the Albanian mountains, and from the Danube to the Ægean, enclosing Okhrida, the ancient capital of the Shishmans, Dibra, and Kastoria,

as well as the districts of Vrania and Pirot, and possessing a Mediterranean port at Kavala. The Dóbruja, notwithstanding its Bulgarian population, was not included in the new state, being reserved as compensation to Rumania for the Russian annexation of Bessarabia; Adrianople, Salonika, and the Chalcidian peninsula, were left to Turkey. The area thus delimited constituted three-fifths of the Balkan Peninsula, with a population of 4,000,000 inhabitants. The Great Powers, however, anticipating that this extensive territory would become a Russian dependency, intervened; and on the 13th July of the same year was signed the Treaty of Berlin, which in effect divided the "Big Bulgaria" of the San Stefano Treaty into three portions. The limits of the principality of Bulgaria, as now defined, and the autonomous province of Eastern Rumelia, have been already described; the remaining portion, including almost the whole of Macedonia and part of the vilayet of Adrianople, was left under Turkish administration. No special organization was provided for the districts thus abandoned; it was stipulated that laws similar to the organic law of Crete should be introduced into the various parts of Turkey in Europe, but this engagement was never carried out by the Porte. Vrania, Pirot, and Nish were given to Serbia, and the transference of the Dóbruja to Rumania was sanctioned. This artificial division of the Bulgarian nation could scarcely be regarded as possessing elements of permanence. It was provided that the prince of Bulgaria should be freely elected by the population, and confirmed by the Sublime Porte with the assent of the Powers, and that, before his election, an assembly of Bulgarian notables, convoked at Trnovo, should draw up the organic law of the principality. The drafting of a constitution for Eastern Rumelia was assigned to a European commission.

Pending the completion of their political organization, Bulgaria and Eastern Rumelia were occupied by Russian troops and administered by Russian officials. The assembly of notables, which met at Trnovo in 1879, was mainly composed of half-educated peasants, who from the first displayed an extremely democratic spirit, in which they proceeded to manipulate the very liberal constitution submitted to them by Prince Dondukoff-Korsakoff, the Russian governor-general. The long period of Turkish domination had effectually obliterated all social distinctions, and the radical element, which now formed into a party under Tzankoff and Karaveloff, soon gave evidence of its predominance. Manhood suffrage, a single chamber, payment of deputies, the absence of a property qualification for candidates, and the prohibition of all titles and distinctions, formed salient features in the constitution now elaborated. The organic statute of Eastern Rumelia was largely modelled on the Belgian constitution. The governor-general, nominated for five years by the Sultan with the approbation of the Powers, was assisted by an Assembly, partly representative, partly composed of *ex-officio* members; a permanent committee was entrusted with the preparation of legislative measures and the general supervision of the administration, while a council of six "directors" fulfilled the duties of a ministry.

On the 29th April 1879 the Assembly at Trnovo, on the proposal of Russia, elected as first sovereign of Bulgaria Prince Alexander of Battenberg, a member of the grand ducal house of Hesse and a nephew of the Tsar Alexander II. Arriving in Bulgaria on the 7th July, Prince Alexander, then in his twenty-third year, found all the authority, military and civil, in Russian hands. The history of the earlier portion of his reign is marked by two principal

Revolt of 1876.

Treaty of Berlin.

Prince Alexander.

features—a strong Bulgarian reaction against Russian tutelage and a vehement struggle against the autocratic institutions which the young ruler, under Russian guidance, endeavoured to inaugurate. Both movements were symptomatic of the determination of a strong-willed and egoistic race, suddenly liberated from secular oppression, to enjoy to the full the moral and material privileges of liberty. In the Assembly at Trnovo the popular party had adopted the watchword “Bulgaria for the Bulgarians,” and a considerable anti-Russian contingent was included in its ranks. Young and inexperienced, Prince Alexander, at the suggestion of the Russian consul-general, selected his first ministry from a small group of “Conservative” politicians whose views were in conflict with those of the parliamentary majority, but he was soon compelled to form a “Liberal” administration under Tzankoff and Karaveloff. The Liberals, once in power, initiated a violent campaign against foreigners in general and the Russians in particular; they passed an alien law, and ejected foreigners from every lucrative position. The Russians made a vigorous resistance, and a state of chaos ensued. Eventually the prince, finding good government impossible, obtained the consent of the Tsar to a change of the constitution, and assumed absolute authority on the 9th May 1881. The Russian general Ernroth was appointed sole minister, and charged with the duty of holding elections for the Grand Sobranye, to which the right of revising the constitution appertained. So successfully did he discharge his mission that the national representatives, almost without debate, suspended the constitution and invested the prince with absolute powers for a term of seven years (July 1881). A period of Russian government followed under Generals Skobelev and Kaulbars, who were specially despatched from St Petersburg to enhance the authority of the prince. Their administration, however, tended to a contrary result, and the prince, finding himself reduced to impotence, opened negotiations with the Bulgarian leaders and effected a coalition of all parties on the basis of a restoration of the constitution. The generals, who had made an unsuccessful attempt to remove the prince, withdrew; the constitution of Trnovo was restored by proclamation (19th September 1883), and a coalition ministry was formed under Tzankoff. Prince Alexander, whose relations with the court of St Petersburg had become less cordial since the death of his uncle, the Tsar Alexander II., in 1881, now incurred the serious displeasure of Russia, and the breach was soon widened by the part which he played in encouraging the national aspirations of the Bulgarians.

In Eastern Rumelia, where the Bulgarian population never ceased to protest against the division of the race,

political life had developed on the same lines as in the principality. Among the politicians two parties had come into existence—the Conservatives or self-styled “Unionists,” and the Radicals, derisively called by their opponents “Kazioni” or treasury-seekers; both were equally desirous of bringing about the union with the principality. Neither party, however, while in power would risk the sweets of office by embarking in a hazardous adventure. It was reserved for the Kazioni, under their famous leader Zakharia Stoyanoff, who in early life had been a shepherd, to realize the national programme. In 1885 the Unionists were in office, and their opponents lost no time in organizing a conspiracy for the overthrow of the governor-general, Krstovitch Pasha. Their designs were facilitated by the circumstance that Turkey had abstained from sending troops into the province. Having previously assured themselves of Prince Alexander’s acquiescence, they seized the governor-general and proclaimed the

union with Bulgaria (18th September). The revolution took place without bloodshed, and a few days later Prince Alexander entered Philippopolis amid immense enthusiasm. His position now became precarious. The Powers were scandalized at the infraction of the Berlin Treaty; England alone showed sympathy, while Russia denounced the union and urged the Porte to reconquer the revolted province—both Powers thus reversing their respective attitudes at the Berlin congress.

The Turkish troops were massed at the frontier, and Serbia, hoping to profit by the difficulties of her neighbour, suddenly declared war (14th November). At the moment of danger the Russian officers, who filled *Servian war.* all the higher posts in the Bulgarian army, were withdrawn by order of the Tsar. In these critical circumstances Prince Alexander displayed considerable ability and resource, and the nation gave evidence of hitherto unsuspected qualities. Contrary to general expectation, the Bulgarian army, imperfectly equipped and led by subaltern officers, successfully resisted the Servian invasion. After brilliant victories at Slivnitsa (19th November) and Tsaribrod, Prince Alexander crossed the frontier and captured Pirot (27th November), but his further progress was arrested by the intervention of Austria. The Treaty of Bucarest followed (3rd March 1886), restoring the *status quo ante*; Serbia, notwithstanding her aggression, escaped a war indemnity, but the union with Eastern Rumelia was practically secured. By the convention of Top-Khané (5th April) Prince Alexander was recognized by the Sultan as governor-general of Eastern Rumelia; a personal union only was sanctioned, but in effect the organic statute disappeared and the countries were administratively united. These military and diplomatic successes, which invested the prince with the attributes of a national hero, quickened the decision of Russia to effect his removal. An instrument was found in the discontent of several of his officers, who considered themselves slighted in the distribution of rewards, and a conspiracy was formed in which Tzankoff, Karaveloff (the prime minister), Archbishop Clement, and other prominent persons were implicated. On the night of the 21st August the prince was seized in his palace by several officers and compelled, under menace of death, to sign his abdication; he was then hurried to the Danube at Rakhovo and transported to Russian soil at Reni. This violent act met with instant disapproval on the part of the great majority of the nation. Stambuloff, the president of the Assembly, and Colonel Mutkuroff, commandant of the troops at Philippopolis, initiated a counter-revolution; the provisional government set up by the conspirators immediately fell, and a few days later the prince, who had been liberated by the Russian authorities, returned to the country amid every demonstration of popular sympathy and affection. His arrival forestalled that of a Russian imperial commissioner, who had been appointed to proceed to Bulgaria. He now committed the error of addressing a telegram to the Tsar in which he offered to resign his crown into the hands of Russia. This unfortunate step, by which he ignored the suzerainty of Turkey, and represented Bulgaria as a Russian dependency, exposed him to a stern rebuff, and fatally compromised his position. The national leaders, after obtaining a promise from the Russian representative at Sophia that Russia would abstain from interference in the internal affairs of the country, consented to his departure; on the 8th September he announced his abdication, and on the following day he left Bulgaria.

A regency was now formed, in which the prominent figure was Stambuloff, the most remarkable man whom modern Bulgaria has produced. A series of attempts to

throw the country into anarchy were firmly dealt with, and the Grand Sobranje was summoned to elect a new prince.

The candidature of the prince of Mingrelia was now set up by Russia, and General Kaulbars was despatched to Bulgaria to make known to the people the wishes of the Tsar. He vainly endeavoured to postpone the convocation of the Grand Sobranje in order to gain time for the restoration of Russian influence, and proceeded on an electoral tour through the country. The failure of his mission was followed by the withdrawal of the Russian representatives from Bulgaria. The Grand Sobranje, which assembled at Trnovo, offered the crown to Prince Valdemar of Denmark, brother-in-law of the Tsar, but the honour was declined, and an anxious period ensued, during which a deputation visited the principal capitals of Europe with the twofold object of winning sympathy for the cause of Bulgarian independence and discovering a suitable candidate for the throne.

On the 7th July 1887, the Grand Sobranje unanimously elected Prince Ferdinand of Saxe-Coburg-Gotha, a grandson, maternally, of King Louis Philippe. The new prince, who was twenty-six years of age, was at this time a lieutenant in the Austrian army. Undeterred by the difficulties of the international situation and the distracted condition of the country, he accepted the crown, and took over the government on the 14th August at Trnovo. His arrival, which was welcomed with enthusiasm, put an end to a long and critical interregnum, but the dangers which menaced Bulgarian independence were far from disappearing. Russia declared the newly-elected sovereign a usurper; the other Powers, in deference to her susceptibilities, declined to recognize him, and the grand vizier informed him that his presence in Bulgaria was illegal. Numerous efforts were made to disturb internal tranquillity, and Stambuloff, who became prime minister on the 1st September, found it necessary to govern with a strong hand. A raid led by the Russian captain Nabokoff was repulsed; brigandage, maintained for political purposes, was exterminated; the bishops of the Holy Synod, who, at the instigation of Clement, refused to pay homage to the prince, were forcibly removed from Sofia; a military conspiracy organized by Major Panitza was crushed, and its leader executed. An attempt to murder the energetic prime minister resulted in the death of his colleague, Beltchev, and shortly afterwards Dr Vlkovitch, the Bulgarian representative at Constantinople, was assassinated. While contending with unscrupulous enemies at home, Stambuloff pursued a successful policy abroad. Excellent relations

were established with Turkey and Rumania, valuable concessions were twice extracted from the Porte in regard to the Bulgarian episcopate in Macedonia, and loans were concluded with foreign financiers on comparatively favourable terms. His overbearing character, however, increased the number of his opponents, and alienated the goodwill of the prince. In 1894 he resigned office; a ministry was formed under Dr Stoiloff, and Prince Ferdinand inaugurated a policy of conciliation towards Russia with a view to obtaining his recognition by the Powers. A Russophil reaction followed, large numbers of political refugees returned to Bulgaria, and Stambuloff, exposed to the vengeance of his enemies, was assassinated in the streets of Sofia (15th July 1895). The prince's plans were favoured by the death of the Tsar Alexander III. in November 1894, and the reconciliation was practically effected by the conversion of his eldest son, Prince Boris, to the orthodox faith (14th February 1896). The Powers having signified their assent, he was nominated by the Sultan prince of Bulgaria and

governor-general of Eastern Rumelia (14th March). Russian influence now became predominant in Bulgaria, but the cabinet of St Petersburg wisely abstained from interfering in the internal affairs of the principality. In February 1896 Russia proposed the reconciliation of the Greek and Bulgarian churches and the removal of the exarch to Sofia. The project, which involved a renunciation of the exarch's jurisdiction in Macedonia, excited strong opposition in Bulgaria, and was eventually dropped. The death of Princess Marie-Louise of Bourbon Parma (30th January 1899), whom Prince Ferdinand had married in 1893, caused universal regret in the country.

Prince Ferdinand's reign has been marked by a great improvement in the material condition of Bulgaria. The completion of a network of railways has considerably benefited the agricultural population, on whose welfare the prosperity of the country depends. Education has progressed, perhaps too rapidly; the principal danger for the future lies in the growth of a class of educated office-seekers, whose intrigues distract the industrious rural population. Notwithstanding the dangers and difficulties which darkened its earlier years, the principality, in the short period of its existence, has made a rapid and striking advance, to which the sister states of the Peninsula cannot offer a parallel. The Bulgarians, a virile, laborious, thrifty, orderly, and persevering people, possess many qualities which will fit them to occupy an important position in the future political system of the Balkan Peninsula. The task which lies before them is to develop the resources of their country, to resist foreign interference, to await the future with confidence and patience, and eventually to include within their boundaries the unenfranchised portion of their race.

3. LANGUAGE AND LITERATURE.

The Bulgarian is at once the most ancient and the most modern of the languages which constitute the Slavonic group. In its groundwork it presents the nearest approach to the old ecclesiastical Slavonic, the liturgical language common to all the orthodox Slavs, but it has undergone more important modifications than any of the sister dialects in the simplification of its grammatical forms; and the analytical character of its development may be compared with that of the neo-Latin and Germanic languages. The introduction of the definite article, which appears in the form of a suffix, and the almost total disappearance of the ancient declensions, for which the use of prepositions has been substituted, distinguish the Bulgarian from all the other members of the Slavonic family. Notwithstanding these changes, which give the language an essentially modern aspect, its close affinity with the ecclesiastical Slavonic, the oldest written dialect, is regarded as established by several eminent scholars, such as Schafarik, Schleicher, Leskien, and Brugman, and by many Russian philologists. These authorities agree in describing the liturgical language as "Old Bulgarian." A different view, however, is maintained by Miklositch, Kopitar, and some others, who regard it as "Old Slovene." According to the more generally accepted theory, the dialect spoken by the Bulgarian population in the neighbourhood of Salonika, the birthplace of SS. Cyril and Methodius, was employed by the Slavonic apostles in their translations from the Greek, which formed the model for subsequent ecclesiastical literature. This view receives support from the fact that the two nasal vowels of the Church-Slavonic (the greater and lesser *us*), which have been modified in all the cognate languages except Polish, retain their original pronunciation locally in the neighbourhood of Salonika and Kastoria; in modern literary Bulgarian the *rhinesmus* has disappeared, but the old nasal vowels preserve a peculiar pronunciation, the greater *us* changing to *u*, as in English "but," the lesser to *ě*, as in "bet," while in Serbian, Russian, and Slovene the former becomes *ū* or *o*, the latter *e* or *ya*. The remnants of the declensions still existing in

Bulgarian (mainly in pronominal and adverbial forms) show a close analogy to those of the old ecclesiastical language.

The Slavonic apostles wrote in the 9th century (St Cyril died in 869, St Methodius in 885), but the original manuscripts have not been preserved. The oldest existing copies, which date from the 10th century, already betray the influence of the contemporary vernacular speech, but as the alterations introduced by the copyists are neither constant nor regular, it is possible to reconstruct the original language with tolerable certainty. The "Old Bulgarian," or archaic Slavonic, was an inflexional language of the synthetic type, containing few foreign elements in its vocabulary. The Christian terminology was, of course, mainly Greek; the Latin or German words which occasionally occur were derived from Moravia and Pannonia, where the two saints pursued their missionary labours. In course of time it underwent considerable modifications, both phonetic and structural, in the various Slavonic countries in which it became the liturgical language, and the various MSS. are consequently classified as "Servian-Slavonic," "Croatian-Slavonic," "Russian-Slavonic," &c., according to the different recensions. The "Russian-Slavonic" is the liturgical language now in general use among the orthodox Slavs of the Balkan Peninsula owing to the great number of ecclesiastical books introduced from Russia in the 17th and 18th centuries; until comparatively recent times it was believed to be the genuine language of the Slavonic apostles. Among the Bulgarians the spoken language of the 9th century underwent important changes during the next three hundred years. The influence of these changes gradually asserts itself in the written language; in the period extending from the 12th to the 15th century the writers still endeavoured to follow the archaic model, but it is evident that the vernacular had already become widely different from the speech of SS. Cyril and Methodius. The language of the MSS. of this period is known as the "Middle Bulgarian"; it stands midway between the old ecclesiastical Slavonic and the modern speech.

In the first half of the 16th century the characteristic features of the modern language became apparent in the literary monuments. These features undoubtedly displayed themselves at a much earlier period in the oral speech; but the progress of their development has not yet been completely investigated. Much light may be thrown on this subject by the examination of many hitherto little-known manuscripts and by the scientific study of the folk-songs. In addition to the employment of the article, the loss of the noun-declensions, and the modification of the nasal vowels above alluded to, the disappearance in pronunciation of the final vowels *yer-golem* and *yer-malik*, the loss of the infinitive, and the increased variety of the conjugations, distinguish the modern from the ancient language. The suffix-article, which is derived from the demonstrative pronoun, is a feature peculiar to the Bulgarian among Slavonic and to the Rumanian among Latin languages. This and other points of resemblance between these remotely related members of the Indo-European group are shared by the Albanian, the representative of the old Illyrian language, and have consequently been attributed to the influence of the aboriginal speech of the Peninsula. A demonstrative suffix, however, is sometimes found in Russian and Polish, and traces of the article in an embryonic state occur in the "Old Bulgarian" MSS. of the 10th and 11th centuries. In some Bulgarian dialects it assumes different forms according to the proximity or remoteness of the object mentioned. Thus *zhena-ta* is "the woman"; *zhena-va* or *zhena-sa*, "the woman close by"; *zhena-na*, "the woman yonder." In the borderland between the Servian and Bulgarian nationalities the local use of the article supplies the means of drawing an ethnological frontier; it is nowhere more marked than in the immediate neighbourhood of the Servian population, as, for instance, at Dibra and Prilep. The modern Bulgarian has admitted many foreign elements. It contains about 2000 Turkish and 1000 Greek words dispersed in the various dialects; some Persian and Arabic words have entered through the Turkish medium, and a few Rumanian and Albanian words are found. Most of these are rejected by the purism of the literary language, which, however, has been compelled to borrow the phraseology of modern civilization from the Russian, French, and other European languages. The dialects spoken in the principality may be classed in two groups—the eastern and the western. The main point of difference is the pronunciation of the letter *yedvoim*, which in the eastern has frequently the sound of *ya*, in the western invariably that of *a* in "ate." The literary language began in the western dialect under the twofold influence of Servian literature and the church Slavonic. In a short time, however, the eastern dialect prevailed, and the influence of Russian literature became predominant. An anti-Russian reaction was initiated by Bogoroff (1818-92), and has been maintained by numerous writers educated in the German and Austrian universities. Since the foundation of the University of Sophia the literary language has taken a middle

course between the ultra-Russian models of the past generation and the dialectic Bulgarian. Little uniformity, however, has yet been attained in regard to diction, orthography, or pronunciation.

The Bulgarians of pagan times are stated by the monk Khrabr, a contemporary of Tsar Simeon, to have employed a peculiar writing, of which inscriptions recently found near Kaspitchan may possibly be specimens. The earliest manuscripts of the "Old Bulgarian" are written in one or other of the two alphabets known as the glagolitic and Cyrillic. The former, which is supposed to have been derived from the cursive Greek of the 9th century, was probably the original alphabet devised by SS. Cyril and Methodius. It was used by Bulgarian writers concurrently with the Cyrillic down to the 12th century, and was maintained till recent times in the church literature of the Catholic Slavs in parts of Dalmatia and the Adriatic archipelago. The Cyrillic, which adopted the uncial Greek characters, is now believed to be of later date than the Slavonic apostles; it is, perhaps, to be attributed to St Clement or one of their other disciples who evangelized Bulgaria. While the glagolitic altered the Greek letters almost beyond recognition, the Cyrillic retained them with little change; both alphabets supplied several new characters to denote Slavonic sounds unknown to the Greek. Many of the oldest glagolitic and Cyrillic manuscripts have been edited by various scholars in recent times; they have been found, for the most part, in Russian libraries, but valuable specimens are preserved in the Vatican, in the monasteries of Rila and Mount Athos, and in Vienna, Agram, Lubliane, Prague, Berlin, and London. The sacred book of Reims, on which the French kings took the coronation oath, is written partly in the Cyrillic, partly in the glagolitic character. Among the orthodox Slavs the Cyrillic finally superseded the glagolitic; as modified by Peter the Great it became the Russian alphabet, which, with the revival of literature, was introduced into Servia and Bulgaria. Some Russian letters which are superfluous in Bulgarian have been abandoned by the native writers, and a few characters have been restored from the ancient alphabet.

The ancient Bulgarian literature, originating in the works of SS. Cyril and Methodius and their disciples, consisted for the most part of theological works translated from the Greek. From the conversion of Boris down to the Turkish conquest the religious character predominates, and the influence of Byzantine literature is supreme. Translations of the gospels and epistles, lives of the saints, collections of sermons, exegetic religious works, translations of Greek chronicles, and miscellanies such as the *Sbornik* of St Sviatoslav, formed the staple of the national literature. In the time of Tsar Simeon, himself an author, considerable literary activity prevailed; among the more remarkable works of this period was the *Shestodnev*, or Hexameron, of John the exarch, an account of the creation. A little later the heresy of the Bogomiles gave an impulse to controversial writing. The principal champions of orthodoxy were St Kosmas and the monk Athanas of Jerusalem; among the Bogomiles the *Questions of St Ivan Bogosloff*, a work containing a description of the beginning and the end of the world, was held in high esteem. Contemporaneously with the spread of this sect a number of apocryphal works, based on the Scripture narrative, but embellished with Oriental legends of a highly imaginative character, obtained great popularity. Together with these religious writings works of fiction, also of Oriental origin, made their appearance, such as the life of Alexander the Great, the story of Troy, the tales of *Stephanit* and *Ichnilat* and *Barlaam and Josaphat*, the latter founded on the biography of Buddha. These were for the most part reproductions or variations of the fantastical romances which circulated through Europe in the Middle Ages, and many of them have left traces in the national legends and folk-songs. In the 13th century, under the Asen dynasty, numerous historical works or chronicles (*letopisi*) were composed. State records appear to have existed, but none of them have been preserved. With the Ottoman conquest literature disappeared; the manuscripts became the food of moths and worms, or fell a prey to the fanaticism of the Phanariot clergy. The library of the patriarchs of Trnovo was committed to the flames by the Greek Metropolitan Hilarion in 1825.

The monk Paisii (born about 1720) and Bishop Sofronii (1739-1815) have already been mentioned as the precursors of the literary revival. The *Istoria Slaveno-Bolgarska* (1762) of Paisii, written in the solitude of Mount Athos, was a work of little historical value, but its influence upon the Bulgarian race was immense. An ardent patriot, Paisii recalls the glories of the Bulgarian tsars and saints, rebukes his fellow-countrymen for allowing themselves to be called Greeks, and denounces the arbitrary proceedings of the Phanariot prelates. The *Life and Sufferings of sinful Sofronii* (1804) describes in simple and touching language the condition of Bulgaria at the beginning of the 19th century. Both works were written in a modified form of the church Slavonic. The first printed work in the vernacular appears to have been a translation of sermons, also by Sofronii, published in 1806. The Servian and Greek insurrections quickened the patriotic sentiments of the Bulgarian refugees and merchants in Rumania, Bessarabia, and southern Russia, and Bucearest became the centre of their political and literary activity. A modest *bulcvan*, or primer, published at Kronstadt by Berovitch in 1824, was the first product of the new movement. Translations of the Gospels, school reading-books, short histories, and various elementary treatises now appear, written with the object of conveying the simple rudiments of knowledge to the ignorant population. With the multiplication of books came the movement for establishing Bulgarian schools, in which the monk Neophyt Rilski (1793-1881) played a leading part. He was the author of a Bulgarian grammar and other educational works, and translated the New Testament into the modern language. Among the writers of the literary renaissance were George Rakovski (1818-67), a fantastic writer of the patriotic type, whose works did much to stimulate the national zeal, Liuben Karaveloff (1837-1879), journalist and novelist, Christo Boteff (1847-76), lyric poet, whose ode on the death of his friend Haji Dimitr, an insurgent leader, is one of the best in the language, and Petko Slaveikoff (died 1895) whose poems, patriotic, satirical, and erotic, moulded the modern poetical language and exercised a great influence over the people. Gavril Krstovitch, formerly governor-general of Eastern Rumelia, and Marin Drinoff, a Slavist of high repute, have written historical works. Stambuloff, the statesman, was the author of revolutionary and satirical ballads; his friend Zacharia Stoyanoff (d. 1889), who began life as a shepherd, has left some interesting memoirs. The most distinguished Bulgarian man of letters is Ivan Vazoff (born 1850), whose epic and lyric poems and prose works form the best specimens of the modern literary language. His well-known novel *Under the Yoke* has been translated into several European languages. The best dramatic work is *Ivanko*, a historical play, by Archbishop Clement, who has also written some novels. With the exception of Zlatarski's geological treatises no original works on natural science have as yet been produced; a like dearth is apparent in the fields of philosophy, criticism, and fine art, but it must be remembered that the literature is still in its infancy. The ancient folk-songs have been preserved in several valuable collections; though inferior to the Servian in poetic merit, they deserve more scientific attention than they have yet received. Several periodicals and reviews have been founded in recent times. Of these the most important are the *Periodichesko Spisanie*, issued since 1869 by the Bulgarian Literary Society, and the *Stornik*, a literary and scientific miscellany, carefully edited by Dr Shishmanoff, and published by the Government at irregular intervals. Bulgarian journalism is still in the crude stage of development; the numerous newspapers published in the capital and the provinces contain little more than polemical diatribes written in the interests of the various political leaders.

(J. D. B.)

Bulgaria, Eastern, on the Volga, a powerful kingdom which existed from the 5th to the 15th century on the middle Volga, in the present territory of the provinces of Samara, Simbirsk, Saratov, and N. Astrakhan, perhaps extending also into Perm. The village Bolgary, near Kazañ, surrounded by numerous graves in which most interesting archæological finds have been made, occupies the site of one of the cities—perhaps the capital—of that extinct kingdom.

The history, *Tarikh Bulgar*, said to have been written in the 12th century by an Arabian cadi of the city Bolgary, has not yet been discovered; but the Arabian historians, Ibn Foslān, Ibn Haulal, Abul Hamid Andalusi, Abu Abdallah Harnati, and several others, who had visited the kingdom, beginning with the 10th century, have left descriptions of it. The Bulgars of the Volga were of Turkish origin, but may have assimilated Finnish and, later, Slavonian elements. In the 5th century they attacked the Russians in the Black Sea prairies, and afterwards made raids upon the Greeks. Ibn Foslān found them in 922 not quite nomadic, and already having some permanent settlements and houses in wood. Stone houses were built soon after that by Arabian architects. Ibn Dasta found amongst them agriculture besides cattle breeding. Trade with Persia and India, as also with the Khazars and the Russians, and undoubtedly with Biarmia (Urals), was, however, their chief occupation, their main riches being furs, leather, wool, nuts, wax, and so on. They accepted Islam in the 10th century, and after that time they began building forts, several of which are mentioned in Russian annals. Their chief town, Bolgary, or Velikij Gorod (Great Town) of the Russian annals, was often raided by the Russians. In the 13th century it was conquered by the Mongols, and became for a time the seat of the Khans of the Golden Horde. In the second half of the 15th century Bolgary became part of the Kazañ kingdom, lost its commercial and political importance, and was annexed to Russia after the fall of Kazañ.

Bull, Ole Bornemann (1810-1880), Norwegian violinist, was born in Bergen, Norway, on 5th February 1810. At first a pupil of the violinist Paulsen, and subsequently self-taught, he was intended for the church, but failed in his examinations, and became a musician, directing the Philharmonic and Dramatic societies at Bergen. In 1829 he visited Spohr at Cassel, and afterwards proceeded to Paris, where he came under the influence of Paganini, and definitely adopted the career of a violin virtuoso, making his first appearance in company with Ernst and Chopin at a concert of his own in Paris, in 1832. Successful tours in Italy and England followed soon afterwards, and he was not long in obtaining European celebrity by his brilliant playing of his own pieces and arrangements. His first visit to the United States lasted from 1843 to 1845, and on his return to Norway he formed a scheme for the establishment of a Norse theatre in Bergen; this became an accomplished fact in 1850; but the harassing business complications which soon had to be faced were too much for him, and he went again to America in 1852. During this visit he bought 125,000 acres of land in Pennsylvania to found a Norwegian colony; but his title turned out to be fraudulent, and the troubles he went through in connexion with the undertaking were enough to affect his health very seriously, though not to hinder him for long from the exercise of his profession. Another attempt to found an academy of

music in Christiania had no permanent result, and, after his second marriage, with an American lady, in 1870, he confined himself to the career of a violinist. He died at Lysø, near Bergen, on 17th August 1880. Ole Bull's "polacca guerriera" and a host of other violin pieces, among them two concertos, are a good deal more interesting to the virtuoso than to the musician, and his fame rests upon his prodigious technique rather than upon any very remarkable attainments in the higher regions of art. The memoir published by his widow in 1886 contains many proofs of the interesting intercourse he enjoyed with a great number of the most eminent men of his time, not merely musicians; it gives a picture of a strong individuality, which often found expression in a somewhat boisterous form of practical humour.

(J. A. F. M.)

Buller, Sir Redvers Henry (1839—), British General, son of Mr J. W. Buller, M.P., of Crediton, Devonshire, was born in 1839, and educated at Harrow. He entered the army in 1858, and served with his regiment, the 60th Rifles, in the China campaign of 1860. In 1870 he became captain, and went on the Red River expedition, where he was first associated with Lord (then Sir Garnet) Wolseley, and in 1873-74 he accompanied the latter on the Ashantee campaign as head of the Intelligence Department, being slightly wounded at the battle of Ordabai. He was mentioned in despatches and made a C.B., besides being raised to the rank of major. In the Kaffir war of 1878-79 and the Zulu war of 1879 he was conspicuous as an intrepid and popular leader of cavalry, and built up a reputation for courage and dogged determination. In particular his conduct of the retreat at Inhlobana (28th March 1879) drew attention to these qualities, and he earned the V.C. for his assistance in rescuing Captain D'Arcy and Lieutenant Everitt on that occasion; he was given the C.M.G. and made lieutenant-colonel and A.D.C. to the Queen. In the Boer war of 1881 he was Sir Evelyn Wood's chief of the staff, thus adding to his experience of South African conditions of warfare. In 1882 he was head of the Field Intelligence Department in the Egyptian campaign, being present at Kassassin and Tel-el-Kebir, and was knighted for his services. Two years later he commanded an infantry brigade in the Sudan under Sir Gerald Graham, and was at the battles of El Teb and Tamai, being promoted major-general for distinguished service on the field. In the Sudan campaign of 1884-85 he was Lord Wolseley's chief of the staff, and was given the command of the desert column when Sir Herbert Stewart was wounded. He once more distinguished himself on this occasion by his conduct of the retreat from Gubat to Gakdul, and by his victory at Abu Klea Wells (16th, 17th February), and he was created K.C.B. In 1887 he was made quartermaster-general at the War Office, and in the same year was Under-Secretary for Ireland for a short period. From 1890 to 1897 he held the office of adjutant-general, attaining the rank of lieutenant-general in 1891. At the War Office his power of work, his quick mastery of detail, and trenchant criticism inspired those that came in contact with him with the belief that he was fitted for the highest command, and in 1895, when the duke of Cambridge was about to retire from the post of Commander-in-Chief, it was an open secret that the Rosebery Cabinet intended Sir Redvers Buller to be his successor, though it was reported that the conditions of the position were to be modified and the title changed to that of Chief of the Staff, as recommended by the Hartington Commission. On the eve, however, of this change being effected, the Government was defeated on Mr Brodrick's

motion with reference to the alleged shortage of small-arm ammunition, and Lord Salisbury's Cabinet, on reconsidering the question of War Office reform as left to them by their predecessors, selected Lord Wolseley as the new Commander-in-Chief for a period of five years, Sir Redvers Buller remaining adjutant-general. In 1898 he took command of the troops at Aldershot, a five years' appointment, and when the Boer war broke out in 1899 he was selected with universal approval to take command of the South African Field Force (see *TRANSVAAL, War*), and landed at Cape Town on 31st October. Owing to the Boer investment of Ladysmith and the apparent helplessness of the generals sent to relieve the situation in Natal, he unexpectedly hurried off to Natal in order to supervise personally the rescue of Sir George White; but on 15th December his attempt to cross the Tugela at Colenso was repulsed with 1100 casualties and the loss of ten guns. The Government, alarmed at the situation and the tone of Sir Redvers Buller's messages, sent out Lord Roberts to supersede him in the chief command, Sir Redvers being left in subordinate command of the Natal force only. His second attempt to relieve Ladysmith (10th to 27th January) proved another failure, the result of the operations at Spion Kop (24th January) causing consternation in England. A third attempt (5th to 7th February) was again unsuccessful, and it was not till 28th February that, the important position of Hlangwane Hill having been occupied on 19th February and Pieter's Hill having been carried by General Hildyard on 27th February, the relief of Ladysmith was accomplished. Sir Redvers Buller remained in command of the Natal army till 24th October 1900, when he returned to England, having in the meanwhile slowly done a great deal of hard work in driving the Boers from the Biggarsberg (15th May), forcing Lang's Nek (12th June), and occupying Lydenburg (6th September); but though he still retained his reputation for dogged determination and was devotedly followed by his own rank and file, the verdict of military critics on his capacity for an important command in delicate and difficult operations had now become decidedly adverse. The continuance in 1901 of his appointment to the Aldershot command, which was the most important in the new army scheme, met with a storm of public criticism, in which the detailed objections taken to his conduct of the operations before Ladysmith (and particularly his heliogram hinting at the contingency of surrender) were given new prominence. On 10th October 1901, at a luncheon in London, Sir Redvers Buller made a speech in answer to these criticisms in terms which were held to be a breach of discipline and contrary to the king's regulations, and on 23rd October it was announced by the War Office that he had been relieved of his command and retired on half-pay.

Bull-fighting.—Bull-fighting is a survival of barbarism, the existence of which is fervently deplored by all but its devotees, whose delight in it is at the present time as keen as at any former period. The British idea of sport is that the creature pursued should have a chance of saving its life by its strength, speed, or natural cunning; the claim of bull-fighting to be regarded as sport is negatived by the fact that the bull is doomed from the moment of its entrance into the arena. But the main objection to the business in the eyes of persons of the most ordinary humanity lies in the atrocious slaughter of horses, which is a leading feature of the entertainment in Spanish eyes. The poor creatures are blindfolded and forced again and again in the bull's way, until, bleeding from many gores, and usually disembowelled, they drop in agony. That a brief description of bull-fighting should be

here given must not be accepted in any way as a token of approval or admiration. Bulls for the purposes of the ring are bred in various parts of Spain, chiefly in the plains of Las Cabezas, Lebrija, and Utrera. Sometimes during the first two years of their lives they are tormented with red cloths in order to teach them to charge, though many persons consider this not only unnecessary but a mistake. At the age of four they are considered ready for the ring, and are purchased by agents, at prices of from £30 to more than double that amount. The arena is some 70 yards in diameter, and the bulls destined for the day's work, usually some half-dozen in number, are confined in an enclosure from which they are driven one by one along a divided passage which leads to the ring. Two *matadors* or *espardos* are engaged in each day's fight, each of them having his own troop of six assistants, which make up what is described as a *cuadrilla*. Two of these subordinates are known as *picadores*, their business being to ride the wretched horses to slaughter; the others are called *banderilleros*, and conduct their operations on foot. The bull-ring at Madrid affords accommodation for over 12,000 people; elsewhere the rings are usually smaller. The spectacle is opened with a procession, and certain formalities also take place, the president at length throwing into the ring the key of the enclosure where the bulls are confined. When the victim is let into the arena his first instinct is usually to charge one of the *picadores*, who is armed with a lance which rarely proves of much service, the result being that the horse is cruelly wounded, and the man not seldom thrown to the ground. If he is unhurt and the horse has sufficient strength to stand, the man remounts to await another charge. It should here be said that in Portugal and also in South America this cruelty is not practised; expert riders, provided with good horses, do duty as *picadores*, and it is considered a disgrace if they do not save their horses from injury. In this latter species of fight the bull's horns are topped with wooden knobs, so that bloodshed is avoided. In Spain usually a dozen horses are killed during a day's fight; sometimes twice as many suffer. The *banderilleros*, known also as *chulos*, then proceed to make play, darting barbs, to which sometimes fireworks are attached, into the bull's body; and when the animal has reached a certain stage of exhaustion the *matador* makes ready to give the *coup de grâce*, after having delivered a brief speech, prefaced by trumpet calls, to the president, who is provided with a white and a red handkerchief, the exhibition of the former signifying approval and of the latter disapproval. The *matador* holds in his left hand a small red cloak known as a *muleta*, and in his right a sword. After inducing the bull to charge several times he endeavours to kill the animal with one thrust aimed at a vital spot in front of the withers. He may, of course, succeed or fail; some thrusts are recognized as good, some as passable, and others as bad. If the *matador* remains without moving, or rather moving only his body to avoid the stroke of the horns, the thrust is known as *recibiendo*; when bull and *matador* are approaching each other the thrust is called *a un tiempo*; if the *matador* advances and kills the bull when it is motionless the lunge is distinguished as *volapié* or *vuelapiés*. These are all considered good strokes. The *matador* is very highly paid, as much as £50 being given to the most prominent men for killing a bull.

(A. E. T. W.)

Bull Run, a small stream in North-Eastern Virginia, U.S.A., a branch of Occoquan Creek, which flows into Potomac river, 23 miles S. of Washington. The surrounding country is undulating, and dissected by sharp stream gorges. The first battle of Bull Run, in the early

part of the Civil War, occurred on 21st July 1861, on the south-west bank near Manassas Junction, between the newly organized army of the Potomac under General M'Dowell and the hardly more experienced forces of the Confederate General Beauregard. It resulted in the total defeat and hasty retreat to Washington of the Federals, and brought the North to a realization of the magnitude of the struggle upon which it was entering. A second battle took place in almost the same position about a year later, on 29th August 1862. General Lee, with a portion of the combined armies of himself and Jackson, moved on Pope, who was established west of Manassas Junction, for the purpose of holding back Lee until M'Clellan's army could be withdrawn from the peninsula. One of the severest battles of the war ensued, in which the Federals were driven back. The main purpose, however, that of delaying Lee's advance on Washington, was achieved.

Bülow, Bernhard Heinrich Karl Martin von, COUNT (1849—), German statesman, was born 3rd May 1849, at Kleinfloßbech, in Holstein. His family is one very widely extended in North Germany, and many members have attained distinction in the civil and military service of Prussia, Denmark, and Mecklenburg. His great-uncle, Heinrich v. Bülow, was Prussian ambassador in England from 1827-40, and married a daughter of Wilhelm v. Humboldt. (See the letters of Gabrielle v. Bülow.) His father, Bernhard Ernst v. Bülow (1815-73), during his early years, held office under the Danish Government for Holstein; in 1862 he entered the service of Mecklenburg-Strelitz, and was representative of Mecklenburg in the Federal Council at Berlin; in 1873 he was invited by Bismarck, who had formed a high opinion of his abilities, to enter the imperial service as secretary of state for Foreign Affairs, and he was one of the German representatives at the Congress of Berlin. Bernhard, the son, after serving in the Franco-Prussian war, entered the Prussian civil service, and was then transferred to the diplomatic service. From 1884 he was first secretary to the embassy at St Petersburg, and acted as *chargé d'affaires*, in 1888 was appointed envoy at Bucharest, and in 1893 to the post of German ambassador at Rome. In 1897, on the retirement of Baron Marshall v. Bieberstein, he was appointed secretary of state for Foreign Affairs (the same office which his father had held) under Prince v. Hohenlohe, with a seat in the Prussian ministry. He was chiefly responsible for carrying out the policy of colonial expansion with which the emperor had identified himself, and in 1899, on bringing to a successful conclusion the negotiations by which Samoa was acquired by Germany, he was raised to the rank of Count. On the resignation of Hohenlohe in 1900, he was chosen to succeed him as chancellor of the empire and president of the Prussian ministry; and in the autumn of the year after the meeting of the Reichstag distinguished himself by the skill and ability with which he defended the policy of the Government and the emperor in China.

From him must be distinguished Otto v. Bülow (b. 1827), an official in the Prussian Foreign Office, who in 1882 was appointed German envoy at Bern, and from 1892 to 1898 was Prussian envoy to the Vatican.

Bülow, Hans Guido von (1830-1894), German pianist and conductor, was born of noble parents at Dresden, 8th January 1830. At the age of nine he began to study music under Friedrich Wieck and Eberwein, as part of a genteel education. It was only after an illness while studying law at Leipzig University in 1848 that he determined upon music as a career. At this time he was

a pupil of Hauptmann. In 1849 more or less revolutionary politics took possession of him. In the Berlin *Abendpost*, a democratic journal, the young aristocrat poured forth his opinions, which were strongly coloured by Wagner's *Art and Revolution*. Wagner's influence was musical no less than political, for a performance of *Lohengrin* under Liszt at Weimar in 1850 completed von Bülow's determination to abandon a legal career. From Weimar he went to Zürich, where the exile Wagner instructed him in the elements of conducting. But he soon returned to Weimar and Liszt; and in 1853 he made his first concert tour, which extended from Vienna to Berlin. Next he became principal professor of the piano at the Stern Academy, and married in his twenty-eighth year Liszt's daughter Cosima. For the following nine years von Bülow laboured incessantly in Berlin as pianist, conductor, and writer of musical and political articles. Thence he removed to Munich, where, thanks to Wagner, he had been appointed Hof-kapellmeister to Ludwig II., and chief of the Conservatorium. There, too, he organized model performances of *Tristan* and *Die Meistersinger*. In 1869 his marriage was dissolved, his wife subsequently marrying Wagner, an incident which, while preventing Bülow from revisiting Bayreuth, never dimmed his enthusiasm for Wagner's dramas. After a temporary stay in Florence, Bülow set out on tour again as a pianist, visiting most European countries as well as the United States of America, before taking up the post of conductor at Hanover, and, later, at Meiningen, where he raised the orchestra to a pitch of excellence till then unparalleled. In 1885 he resigned the Meiningen office, and conducted a number of concerts in Russia and Germany. At Frankfurt he held classes on Liszt's lines for the higher development of piano-playing. He constantly visited England, for the last time in 1888, in which year he went to live in Hamburg. Nevertheless he continued to conduct the Berlin Philharmonic Concerts. He died at Cairo, on 13th February 1894. Bülow will long be remembered as a pianist of the highest order of intellectual attainment, an artist of remarkably catholic tastes, a passionate hater of humbug and affectation, and one of the greatest orchestral conductors the world has seen. He had a ready pen, and a biting, incisive, sometimes almost rude wit, yet of his kindness of heart and generosity countless tales were told. His compositions are few and unimportant; his arrangement of some of Wagner's dramas for the piano-forte are exceedingly difficult. (R. H. L.)

Bunbury, a seaport and municipality in Western Australia, in the county of Wellington, 112 miles by road S. by W. of Perth, with which it is connected by rail. The harbour, known as Koombanah Bay, is sheltered by a coral reef, on which a breakwater was begun by the Government in 1897. In 1900 it had a length of over 3200 feet. Tin, timber, sandal-wood, horses, and produce are shipped. Its population in 1891 was 572; in 1900 about 3000.

Bundaberg, a river port and municipality in Queensland, Australia, in the county of Cook, on the river Burnett, 10 miles from its mouth, 70 miles by rail N. of Maryborough on the line from Brisbane. A mile below the town, at Millaquin, is the largest sugar factory in the colony. There are numerous other sugar factories and mills in the district. The staple exports are sugar (about 35,000 tons annually), golden syrup, and timber. The climate is remarkably healthy. Population (1891), 3982; of town and district (1900), 14,000.

Bundelkhand, a tract of country in Central

India, lying between the North-West and the Central Provinces. Historically it includes the five British districts of Hamirpur, Jalaun, Jhansi, Lalitpur, and Banda, which now form part of the Allahabad division of the North-West Provinces, but politically it is restricted to a collection of native states, under the Bundelkhand agency. These number about thirty in all, with a total area of 10,241 square miles; total population (1891), 1,508,053, being an average of 145 persons per square mile; (1901), 1,309,323, showing a decrease of 13 per cent., due to the effects of famine. The most important of the states are Orchha, Panna, Chatarpur, Datia, Charkhari, Bijawar, and Ajaigarh. Up to the present no railway traverses the country. A garrison of all arms is stationed at Nowgong, where also there is a Rajkumar college for training the sons of the chiefs according to the methods of an English public school, with 17 pupils in 1897-98.

Bundi, or BOONDEE, a native state of India, in the Rajputana agency, lying on the north-east of the river Chambal, in a hilly tract historically known as Haraoti. It has an area of 2245 square miles. In 1881 the population was 254,701; in 1891 it was 295,675, giving an average density of 133 persons per square mile; in 1901, 171,227, showing a decrease of 42 per cent., due to the effects of famine. The estimated gross revenue in 1897-98 was Rs.7,00,000; the tribute, Rs.1,20,000. There is no railway, but the metalled road from Kotah to the British cantonment of Deoli passes through the state. In 1897-98 the mint coined no less than Rs.3,17,686. The town of BUNDI had a population in 1891 of 22,544. A school for the education of boys of high rank was opened in 1897.

Bunsen, Robert Wilhelm von (1811-1898), German chemist, was born in Göttingen on 31st March 1811. He studied at the university in that town, becoming *privat docent* in 1833. Three years later he was appointed to succeed Wöhler in the chair of Chemistry at the Polytechnic School of Cassel, and in 1838 moved to Marburg, where he remained some thirteen years. Then, for a short time, he was professor of Chemistry at Breslau, and in 1852 accepted a similar position at Heidelberg, where he spent the rest of his days, in spite of an urgent invitation to migrate to Berlin as successor to Mitscherlich. He retired from active work in 1889, and died at Göttingen on 16th August 1898. The first research, by which attention was drawn to Bunsen's abilities, was concerned with the cacodyl compounds of arsenic. It was begun in 1837 at Cassel, and during the six years he spent upon it he not only lost the sight of one eye through an explosion, but nearly killed himself by arsenical poisoning. It represents almost his only excursion into organic chemistry, and apart from its accuracy and completeness it is of historical interest in the development of that branch of science as being the forerunner of the fruitful investigations on the organo-metallic compounds subsequently carried out by his English pupil, Edward Frankland. Simultaneously with his work on cacodyl, he was studying the composition of the gases given off from blast furnaces. He showed that in German furnaces nearly half the heat yielded by the fuel was being allowed to escape with the waste gases, and when he came to England, and in conjunction with Lyon Playfair investigated the conditions obtaining in English furnaces, he found the waste to amount to over 80 per cent. These researches marked a stage in the application of scientific principles to the manufacture of iron, and they led also to the elaboration of Bunsen's famous methods of measuring gaseous volumes, &c., which form the subject of the only book he ever published. In 1841 he invented the carbon-

zinc battery which is known by his name, and which conducted him to several important achievements. He first employed it to produce the electric arc, and showed that from 44 cells a light equal to 1170 candles could be obtained with the consumption of one pound of zinc per hour. To measure this light he designed another instrument, which in various modifications has come into extensive use—the grease-spot photometer. In 1852 he began to carry out electrolytical decompositions by the aid of the battery, thus foreshadowing what has become an important branch of chemical industry. By means of a very ingenious arrangement he obtained magnesium for the first time in the metallic state, and studied its chemical and physical properties, among other things demonstrating the brilliance and high actinic qualities of the flame it gives when burnt in air, in the way now familiar to every photographer. Another, and perhaps the best known, of the contrivances which the world owes to him is the Bunsen burner. When the new laboratory was built at Heidelberg in 1855, it became necessary to install apparatus to supply heat for the conduct of chemical operations. Bunsen was dissatisfied with all the contrivances that were brought to his notice, and finally set himself to devise a simple means of burning ordinary coal gas with a hot smokeless flame. The result of his labours was the well-known burner which is now employed by thousands for all sorts of purposes. Mention must also be made of another piece of work of a rather different character. Travelling was one of his favourite relaxations, and in 1846 he paid a visit to Iceland. There he investigated the phenomena of the geysers, the composition of the gases coming off from the fumaroles, their action on the rocks with which they came into contact, &c., and on his observations was founded a noteworthy contribution to geological theory. But the most far-reaching of his achievements was the elaboration, about 1859, jointly with Kirchhoff, of spectrum analysis, which has put a new weapon of extraordinary power into the hands both of chemists and astronomers. It led Bunsen himself almost immediately to the isolation of two new elements of the alkali group, caesium and rubidium. Having noticed some unknown lines in the spectra of certain salts he was examining, he set to work to obtain the substance or substances to which these were due. To this end he evaporated large quantities of the Dürkheim mineral water, and it says much both for his perseverance and powers of manipulation that he dealt with 40 tons of the water to get about 17 grammes of the mixed chlorides of the two substances, and that with about one-third of that quantity of caesium chloride was able to prepare the most important compounds of the element and determine their characteristics, even making goniometrical measurements of their crystals.

Bunsen founded no school of chemistry; that is to say, no body of chemical doctrine is associated with his name. Indeed, he took little or no part in discussions of points of theory, and, although he was conversant with the trend of the chemical thought of his day, he preferred to spend his energies in the collection of experimental data. One fact, he used to say, properly proved is worth all the theories that can be invented. But as a teacher of chemistry he was almost without rival, and his success is sufficiently attested by the scores of pupils who flocked from every part of the globe to study under him, and by the number of those pupils who afterwards made their mark in the chemical world. The secret of this success lay largely in the fact that he never delegated his work to assistants, but was constantly present with his pupils in the laboratory, assisting each with personal direction and advice; he was also one of the first to appreciate the value of practical work to the student, and he instituted a regular practical

course at Marburg so far back as 1840. Though alive to the importance of applied science, he considered truth alone to be the end of scientific research, and the example he set his pupils was one of single-hearted devotion to the advancement of knowledge.

(H. M. R.)

Buoy, a floating body employed to mark the navigable limits of channels, their fairways, sunken dangers or isolated rocks, mined or torpedo grounds, telegraph cables, or the position of a ship's anchor after letting go; they are also used for securing a ship to in lieu of anchoring. They vary in size and construction from a log of wood to mooring steel buoys for battleships or a steel gas buoy. In 1882 a conference was held upon a proposal to establish a uniform system of buoyage. It was under the presidency of H.R.H. the duke of Edinburgh, and consisted of representatives from the various bodies interested. The questions of colour, visibility, shape, and size were considered, and any modifications necessary owing to locality. The committee proposed the following uniform system of buoyage, and it is now adopted by the general lighthouse authorities of the United Kingdom:—(1) The mariner when approaching the coast must determine his position on the chart, and note the direction of the main stream of flood tide. (2) The term "starboard-hand" shall denote that side which would be on the right hand of the mariner either going with the main stream of flood, or entering a harbour, river, or estuary from seaward; the term "port-hand" shall denote the left hand of the mariner in the same circumstances. (3)¹ Buoys showing the pointed top of a cone above water shall be called conical (Fig. 1) and shall always be starboard-hand buoys, as above defined.

Fig. 1.

Fig. 2.

(4)¹ Buoys showing a flat top above water shall be called can (Fig. 2), and shall always be port-hand buoys as above defined. (5) Buoys showing a domed top above water shall be called spherical (Fig. 3), and shall mark the ends of middle grounds. (6) Buoys having a tall central

¹ In carrying out the above system the Northern Lights Commissioners have adopted a red colour for conical or starboard-hand buoys, and black colour for can or port-hand buoys, and this system is applicable to the whole of Scotland.

structure on a broad face shall be called pillar buoys (Fig. 4), and like all other special buoys, such as bell buoys, gas buoys, and automatic sounding buoys, shall be placed

Fig. 3.

to mark special positions either on the coast or in the approaches to harbours. (7) Buoys showing only a mast above water shall be called spar buoys¹ (Fig. 5). (8) Starboard-hand buoys shall always be painted in one colour only. (9) Port-hand buoys shall be painted of another characteristic colour either single or parti-colour. (10) Spherical buoys (Fig. 3) at the ends of middle grounds shall always be distinguished by horizontal stripes of

Fig. 4.

Fig. 5.

Fig. 6.

white colour. (11) Surmounting beacons, such as staff and globe and others,² shall always be painted of one dark colour. (12) Staff and globe (Fig. 1) shall only be used on starboard-hand buoys; staff and cage (Fig. 2) on port-hands; diamonds (Fig. 7) at the outer ends of middle grounds; and triangles (Fig. 3) at the inner ends. (13) Buoys on the same side of a channel, estuary, or tideway, may be distinguished from each other by names, numbers,

Fig. 7.

or letters, and where necessary by a staff surmounted with the appropriate beacon. (14) Buoys intended for moorings (Fig. 6) may be of shape or colour according to the discretion of the authority within whose jurisdiction they are laid, but for marking submarine telegraph cables the colour shall be green, with the word "Telegraph" painted thereon in white letters. **Buoys and Marking of Wrecks.**—(15) Wreck buoys in the open sea, or in the approaches to a harbour or estuary, shall be coloured green, with the word "Wreck" painted in white letters on them. (16) When possible, the buoy should be laid near to the side of the wreck next to mid-channel. (17) When a wreck-marking vessel is used, it shall, if possible, have its top sides coloured green, with the word "Wreck" in white letters thereon, and shall exhibit by day, three balls on a yard 20 feet above the sea, two placed vertically at one end and one at the other, the single ball being on the side nearest to the wreck; in fog, bell and gong in quick succession at intervals not exceeding one minute (wherever practicable); by night, three white fixed lights similarly arranged, but not

the ordinary riding lights. (18) In narrow waters or in rivers and harbours under the jurisdiction of local authorities, the same rules may be adopted, or, at discretion, varied as follows:—When a wreck-marking vessel is used she shall carry a cross-yard on a mast with two balls by day, placed horizontally not less than 6 nor more than 12 feet apart, and two lights by night similarly placed. When a barge or open boat only is used, a flag or ball may be shown in the daytime. (19) The position in which the marking vessel is placed with reference to the wreck shall be at the discretion of the local authority having jurisdiction. A uniform system by shape has been adopted by the Mersey Dock and Harbour Board, to assist

a mariner by night, and, in addition, where practicable, a uniform colour; the fairway buoys are specially marked by letter, shape, and colour. British India has practically adopted the British system. United States and Canada have the same uniform system; in the majority of European maritime countries and China various uniform systems have been adopted. In Norway and Russia the compass system is used, the shape, colour, and surmountings of the buoys indicating the compass bearing of the danger from the buoy; this method is followed in the open sea by Sweden. An international uniform system of buoyage, although desirable, appears impracticable. Germany employs yellow buoys to mark boundaries of quarantine stations. The question of shape *versus* colour, irrespective of size, is a disputed one; the shape is a better guide at night and colour in the daytime. All markings (Figs. 8, 9, 10, and 11) should be subordinate to the main colour of the buoy; the varying backgrounds and atmospheric conditions render the question a complex one. Trinity House buoys are divided into five classes, their use depending on whether the spot to be marked is in the open sea, or in an otherwise exposed position, or is in a sheltered harbour, or according to the depth of water and weight of moorings, or the importance of the danger. Buoys are moored with specially tested cables (see CABLE); the eye at

Fig. 12.

the base of the buoy is of wrought iron to prevent it becoming "reeby," and the cable is secured to blocks (see ANCHOR) or mushroom anchors according to the nature of the ground. Trinity House buoys are built of steel, with bulkheads to lessen the risk of their sinking by collision, and with the exception of bell buoys, do not contain water ballast. In 1878 gas buoys, with fixed and occulting lights of 10 candle power, were introduced. In 1896 Mr T. Matthews, engineer-in-chief to the Trinity corporation, developed the present design (1901) (Fig. 12). It is of steel, the lower plates being $\frac{5}{8}$ in. and the upper $\frac{7}{8}$ in. in thickness, thus adding to the buoy's stability. The buoy holds 380 cubic feet of gas, and exhibits an occulting light for 2533 hours, 10 feet above the sea, and is visible 8

¹ Useful where floating ice is encountered.

² St George and St Andrew crosses are principally employed to surmount shore beacons.

miles, with an intensity of 50 candles. The light occults every ten seconds, seven seconds' visibility and three seconds' obscuration, the occultations being actuated by a double valve arrangement. In the body of the apparatus there is a gas chamber having sufficient capacity, in the

Fig. 13.

case of an occulting light, for maintaining the flame in action for seven seconds, and by means of a by-pass a jet remains alight in the centre of the burner. During the period of three seconds' darkness the gas chamber is re-charged, and at the end of that period is again opened to the main burner by a tripping arrangement of the valve, and remains in action seven seconds. The gas chamber of the buoy, charged to five atmospheres, is replenished from a steamer fitted with a pump and transport receivers carrying indicating valves, the receivers being charged to ten atmospheres. Practically no inconvenience has resulted from saline or other deposit, the glazing (glass) of the lantern being thoroughly cleaned when re-charging the buoy. Electric light is exhibited from some buoys in the United States. In England an automatic electric buoy has been suggested, worked by the motion of the waves, which cause a stream of water to act on a turbine connected with a dynamo generating electricity, but at present gas is preferred by British authorities as an illuminant. Boat-shaped buoys are occasionally used for carrying a light or bell. The Courtenay whistling buoy (Fig. 13) is actuated by the undulating movement of the waves. A hollow cylinder extends from the lower part of the buoy to below the movement of the waves, ensuring the water inside keeping at mean level, whilst the buoy follows the movements of the waves. By a special apparatus the compressed air is forced through the whistle at the top of the buoy, and is replenished by two tubes at the upper part of the buoy. It is fitted with a rudder and secured in the usual manner. Automatic buoys cannot be relied on in calm days with a smooth sea. The nun buoy (Fig. 14) for indicating the position of an anchor after letting go, is secured to the crown of the anchor by a buoy rope. It is usually made of galvanized iron, and consists of two cones joined together at the base and is painted red for the port anchor and green for the starboard. A mooring buoy (Fig. 6) for a battleship is built of steel in four watertight compartments, and has sufficient buoyancy to keep afloat should a compartment be pierced; they are 13 ft. long with a diameter of $6\frac{1}{2}$ ft. The mooring cable (bridle) passes through a watertight 16 in. trunk pipe, built vertically in the centre of the buoy, and is secured to a "rocking shackle" on the upper surface of the buoy. Large mooring buoys are usually protected by horizontal wooden battens and are fitted with life chains.

(J. W. D.)

Burano, a town of the province of Venice, Venetia, Italy, on an island in the lagoon, 7 miles N.E. from Venice. The men are engaged in fishing, extracting salt, and making gondolas, whilst the women devote their time to lace-making. Population of island (1899), 4500.

Burauen, one of the four interior towns of Leyte, Philippine Islands, in latitude $10^{\circ} 9' N$. Its most important export is hemp. Woven fabrics are produced by the women in some quantity. The language is Visayan. Population, 21,000.

Fig. 14.

Burckhardt, Jakob (1818-1897), Swiss writer, was born at Basel, 25th May 1818. He devoted himself to the study of history and of art, and was successively professor at Basel, at Zürich, and at Basel again. His first work of importance was published in 1842, and treated of the works of art in Flemish cities. In 1853 he produced *The Age of Constantine the Great*, a valuable study of the decay of ancient civilization. In 1855 appeared his *Cicerone*, a guide to objects of art and architecture in Italy which, by revision in numerous successive editions, has become indispensable to the æsthetic traveller. This labour naturally directed Burckhardt's attention to the renaissance, and he wrote *The Culture of the Renaissance*, 1860; and *The History of the Renaissance*, 1867. His latter years were principally devoted to the elaboration of his writings. He died at Basel, 8th August 1897.

Burdett-Coutts, Angela Georgina, BARONESS (1814-—), British philanthropist, was born 25th April 1814, being the youngest daughter of Sir Francis Burdett, Bart., so famous in the early part of the 19th century as Liberal member for Westminster, and grand-daughter of Mr Thomas Coutts, the no less celebrated banker. Inheriting in 1837 a vast fortune from her grandfather, Lady Burdett-Coutts (who was raised to the peerage as a baroness in 1871), has devoted her life to works of public and private charity and beneficence. It has been her especial aim to benefit the working classes in ways involving no loss of independence or self-respect in the recipients of her bounty. She has sent destitute boys into the navy and mercantile service; provided means for the struggling to emigrate, and insured them a fair start in the colonies; created or restored fisheries on the Irish coast; founded and maintained schools, industrial and otherwise; erected and administered model dwellings, and established markets for the poor. She has been no less active in the promotion of moral reform by the foundation of refuges and reformatories for the criminal and abandoned of both sexes. She has endowed three colonial bishoprics, built and endowed several churches; her bounty has relieved the distresses of Bulgarian refugees; her helping hand has been stretched out to the Dyaks of Borneo and the aborigines of South Australia; and she has been indefatigable in lending her aid to support home and foreign church missions, and schemes for extending British civilization in tropical countries, and for developing the colonial estates of the British Empire. In 1881 she married Mr William Lehman Ashmead Bartlett, M.P. for Westminster since 1885, who assumed his wife's name by royal license.

Burdon-Sanderson, Sir John Scott, BART. (1828-—), English physiologist, was born at Jesmond, near Newcastle, on 21st December 1828, and received his medical education at the university of Edinburgh. In 1856 he became medical officer of health for Paddington, and four years later physician to the Middlesex and the Brompton Consumption Hospitals. When diphtheria appeared in England in 1858 he was sent to investigate the disease at the different points of outbreak, and in subsequent years he carried out a number of similar inquiries, e.g., on the cattle plague and on cholera in 1866. He became first principal of the Brown Institution at Lambeth in 1871, and three years afterwards succeeded Sharpey in the Jodrell professorship of physiology at University College, London. When the Waynflete chair of physiology was established at Oxford in 1883, he was chosen to be its first occupant, and immediately found himself the object of a furious anti-vivisectionist agitation. The proposal that the university should spend £10,000 in providing him with a suitable laboratory, lecture-rooms,

&c., in which to carry on his work, was strongly opposed, by some on grounds of economy, but largely because he was an upholder of the usefulness and necessity of experiments upon animals. It was, however, carried by a small majority (88 to 85), and in the same year the Royal Society awarded him a Royal medal in recognition, not only of his researches on the electrical phenomena exhibited by plants, and on the relations of minute organisms to disease, but also of the services he had rendered to physiology and pathology, and of his efforts to promote the study of those sciences in Great Britain. But his opponents at Oxford were not silenced by this adverse vote, and in 1885, after an unavailing effort in the preceding year, they had a third chance, Convocation being asked to vote £500 a year for three years for the purposes of the laboratory, which was then approaching completion. This proposal was fought with the utmost bitterness, and long circulars were issued by both sides, the signatories to that of the anti-vivisectionists including Freeman, Ruskin, and Bishop Mackarness of Oxford. Ultimately, in one of the most disorderly meetings of Convocation ever known, the money was granted by 412 to 244 votes, and the Oxford Medical School, for which Burdon-Sanderson has done so much, was saved from uselessness. In 1885 he was appointed regius professor of medicine at Oxford, and in 1899 he was created a baronet. His attainments, both in biology and medicine, have brought him many honours. He has delivered the Croonian lectures of the Royal Society, has been Harveian orator of the Royal College of Physicians (1878), has acted as president of the British Association (1893), and has served on three royal commissions—Hospitals (1883), Tuberculosis (1890), and University for London (1892-94).

Burdwan, or BARDWAN, a town of British India, in Bengal, which gives its name to a district and to a division. It is situated in 23° 14' N. lat. and 87° 54' E. long., and has a station on the East Indian railway, 67 miles N.W. from Calcutta. It had a population in 1891 of 34,777. The town owes its importance to the residence of the Maharaja of Burdwan, the premier nobleman of Lower Bengal, with a rent-roll of Rs.46,68,233. The palace is built and furnished after European fashion, and the grounds include a fine menagerie. A college, entirely supported by the estate, at an annual cost of Rs.8546, was attended in 1896-97 by 274 students. A good water-supply is derived from the river Banka. There are four printing-presses, one of which issues a vernacular newspaper. The town also contains a public library.

The district of BURDWAN lies along the right bank of the river Bhagirathi or Hooghly. It has an area of 2697 square miles. Population (1881), 1,394,220; (1891), 1,391,834, showing a slight decrease due to the prevalence of endemic fever; average density, 516 persons per square mile. Classified according to religion, Hindus numbered 1,117,743; Mahomedans, 267,224; aborigines, 5459; Christians, 1408, of whom 657 were Europeans. In 1901 the population was 1,534,113, showing an increase of 10 per cent. The land revenue and rates in 1897-98 were Rs.32,92,843; the number of police was 624; in 1896-97 the number of boys at school was 44,549, being 43·4 per cent. of the male population of school-going age; the registered death-rate in 1897 was 30 per thousand. There are 11 indigo factories. The district suffered from drought in 1896-97. The Eden canal, 20 miles long, has been constructed for irrigation. The weaving of silk is the chief native industry. As regards European industries, Burdwan takes the first place in Bengal. It contains the great coal-field of Raniganj, with 87 mines great and small, employing more than

30,000 men, women, and children, with an output of more than three million tons. The Barrakur ironworks produce pig-iron, which is reported to be as good as that of Middlesbrough. During 1897-98 the total output was 19,719 tons. The value of the iron sold was Rs.12,34,080, being nearly threefold that of two years previously. Apart from Burdwan town and Raniganj, the chief places are the river-marts of Katwa and Kalna. The East Indian railway has two lines running through the district, with sixteen stations.

The division of BURDWAN comprises the six districts of Burdwan, Birbhum, Bankura, Midnapore, Hooghly, and Howrah, with a total area of 13,956 square miles, and a population in 1891 of 7,688,818, being an average density of 550 persons per square mile; the land revenue and rates were Rs.90,30,964; the number of police was 3628, being one policeman to every 3·8 square miles of area and to every 2126 of population. In 1896-97 the number of schools was 11,380, attended by 316,699 pupils, of whom 18,484 were girls.

Burgas, capital of a department in Bulgaria, and an important seaport, situated on a promontory on the Gulf of Burgas, 76 miles N.E. of Adrianople. For some time it threatened to rival Varna as the chief port of Bulgaria, but notwithstanding the completion by the *Société des Batignolles* of a splendid harbour in 1900, with a capacious quay, affording access to vessels of deep draught, the port may even yet decline in importance; the sudden change in its prospects being due partly to the recent cession of the Yamboh-Saramberg line to the Orient company, whose aim is to draw the trade to Dedeagatch and Constantinople, and partly to the opening of the Sofia-Varna line, which tends to attract a portion of the import trade to Sofia. The number of vessels that entered the port in 1897 was 519 of 569,432 tons, the number in 1899 being 599 of 356,192 tons. The value of the imports in 1899 was £248,600 and of the exports £200,500. The population is about 12,000.

Burgers, Thomas François (1834-1881), President of the Transvaal Republic, was born 15th April 1834, and was sent to be educated at Utrecht, where he took the degree of Doctor of Theology. On his return to South Africa he was ordained minister of the Dutch Reformed Church, and stationed at Hanover in Cape Colony, where he exercised his ministrations for eight years. In 1862 his preaching attracted attention, and two years later an ecclesiastical tribunal suspended him for heretical opinions. He appealed, however, to the Colonial Government which had appointed him, and obtained judgment in his favour, which was supported by the Privy Council of England on counter-appeal in 1865. On the resignation of Pretorius, on 1st July 1872, he was elected President by the Transvaal Boers, and in 1873 he endeavoured to persuade Montsioa to agree to an alteration in the boundary of the Barolong territory as fixed by the Keate award, but failed. In 1875 Burgers, leaving the Transvaal in charge of Acting-President Joubert, went to Europe mainly to promote the Delagoa Bay railway scheme. After meeting with refusals in London he managed to raise £90,000 in Holland, and bought a quantity of railway plant, which on its arrival at Delagoa Bay was mortgaged to pay freight, and this, so far as Burgers was concerned, was the end of the matter. In June 1876 he induced the Raad to declare war against Secocoeni. The campaign was unsuccessful, and with its failure the republic collapsed, and the Transvaal was annexed to Great Britain, 12th April 1877. Mr Burgers accepted a pension from the British Government, and settled down to farming in Hanover. He died at Rich-

mond, South Africa, on 9th December 1881, and in the following year a volume of short stories, *Tooneelen uit ons dorp*, originally written by him for the Cape *Volksblad*, was published at the Hague for the benefit of his family. A patriot, a fluent speaker both in Dutch and in English, and possessed of unbounded energy, the failure of Burgers was due to his fondness for large visionary plans, which he attempted to carry out with insufficient means.

Burgon, John William (1813-1888), British divine, was born at Smyrna, 21st August 1813, and was the son of a Turkey merchant, who was also a skilled numismatist, and afterwards became an assistant in the Antiquities Department of the British Museum. His mother was a Greek. In deference to his father's wish he resigned his preference for a life of study and entered his father's counting-house. In 1841, however, the elder Burgon was compelled to relinquish business, and his son was then enabled to give free course to his inclinations. In that same year he entered at Oxford. He afterwards gained the Newdigate Prize Poem, and took his degree in 1845. Among those who had influenced his life up to this time were his brother-in-law, Henry John Rose, the well-known scholar and theologian, not, however, to be confounded with his brother, Hugh James Rose, who was conspicuous in the movement which had culminated in the *Tracts for the Times*. Burgon made Oxford his headquarters, while holding a living at some distance. In 1863 he was made vicar at St. Mary's. He had previously visited Rome and the East, and commenced his characteristic literary career. In 1860 appeared the famous *Essays and Reviews*, which Burgon vehemently attacked in a series of sermons afterwards published. In 1869 he protested against the elevation of Dr. Temple to the see of Exeter, on the ground of his having contributed to *Essays and Reviews*. In 1871 he published an able and learned defence of the genuineness of the twelve last verses of St. Mark's Gospel. In 1871 he commenced his attacks on the proposal for a new lectionary for the Church of England, based to a great extent upon his objections to the principles for determining the authority of MS. readings adopted by Westcott and Hort, which he assailed in a memorable article in the *Quarterly Review* for 1881. This, with his other articles, was reprinted in 1884 under the title of *The Revision Revised*. His biographical essays on Dean Mansel and others were also collected, and published under the title of *Twelve Good Men*, a highly entertaining book. Protests against the inclusion of Dr. Vance Smith among the Revisers, against the nomination of Dean Stanley to be select preacher in the University of Oxford, and against the address in favour of toleration in the matter of ritual, followed in succession. In 1875 Burgon was made Dean of Chichester. He died on the 4th August 1888. His life was written by Dean Goulburn. Vehement and almost passionate in his convictions, Burgon nevertheless possessed a warm and kindly heart. While the strength of his language not unfrequently caused irritation, it did not make him a single enemy, and his decided religious opinions, his profound erudition, his energy and courage, secured for him many friends. He may be described as a High Churchman of the type prevalent before the rise of the Tractarian School. His extensive collection of transcripts from the Greek Fathers, illustrating the text of the New Testament, was bequeathed to the British Museum. (J. J. L.*)

Burgos, a province in the north of Spain, including the distant county of Trevino, lying between Alava and Navarra. The population was 332,461 in 1877, 338,551 in 1887, and 340,001 in 1897, on an area of 5651 square miles. The province is divided into 12 administrative

districts and 512 parishes. There has been for many years an excess of births over deaths, and the relatively small increase of population is attributed to emigration of the inhabitants to other parts of Spain. The northern and north-eastern districts are mountainous, and the central and southern form part of the vast and elevated plateau of Old Castile. Eastwards are the highest peaks of the province, with the Cerro de San Millan, 6995 feet high. Two ranges of mountains, running east and west of Pancorbo, leave a gap through which run the railway and roads connecting Castile with the valley of the Ebro, at a place that has oft been called the "Iron Gates of Castile," as a handful of men could hold the Pancorbo pass against an army. South of this spot begins the plateau, generally covered with snow in winter, swept by such cold winds that Burgos is considered, with Soria and Segovia, one of the coldest regions of the peninsula. As but little rain falls in summer in this province, the soil is poor, and most of it is devoted to the rearing of flocks; agriculture thrives only in some valleys, especially that of the Ebro. This river runs eastwards through the province for 62 miles, but is not navigable. The river Douro, too, enters the province, running W.N.W. for 37 miles, with less water than the Ebro; it also is unnavigable in its upper valley. The province has other important streams, the Pisuerga flowing south towards Palencia and Valladolid, and the Arlanzon, which flows in Burgos territory for over 75 miles. The variations of temperature are great, as from 9° to 20° of frost have frequently been recorded in winter, while the mean summer temperature is 64° (Fahrenheit). There are few industries worth mentioning; the chief features in this connexion are potteries, stone quarries, tanneries, and factories for the manufacture of linen and cotton of the coarsest description. The ancient cloth and woollen industries, for which Burgos was famous in days gone by, have almost disappeared. But the province is one of the richest in live stock, containing 736,730 head in all. This total includes 14,808 horses, 17,557 mules, 25,838 asses, 69,323 cattle, 514,747 sheep, 61,493 goats, and 32,964 pigs. 480,860 acres are devoted to the culture of wheat; 72,177 to barley, rye, and oats; 11,375 to pod fruits; 95,000 acres to vineyards. Only 10 mines are at work: 152 are registered as unproductive. Among the former are 2 coal mines, 1 kaolin, and 7 salt. Lack of proper railways, and even of good roads, is the principal drawback to the development of the mining interests. Some extensions have been made of late years in the railway system, but there are in all only 125 miles of lines in the province; 82 of these belong to the main northern line going from Madrid to the French frontier, and 25 to the direct line between Ariza and Valladolid.

Burgos, capital of the above province, 226 miles north of Madrid by rail. Population in 1897, 31,741. The town has not been much altered. A few streets in the new part have been embellished, and some official buildings, the residences of the governor, the town hall, clubs, and theatre have been improved. It is still a great mart for agriculture, but its local industries have decayed, especially the manufacture of linen and woollen stuffs; paper and leather goods, on the contrary, are exported in considerable quantities.

Burial AND Burial Acts.—The main lines of the law of burial in England may be stated very shortly. Every person has the right to be buried in the churchyard or burial ground of the parish where he dies, with the exception of executed felons, who are buried in the precincts of the prison or in a place appointed by the Home Office. At common law the person under whose roof a death takes place has a duty to provide for the body being

carried to the grave decently covered; and the executors or legal representatives of the deceased are bound to bury or dispose of the body in a manner becoming the estate of the deceased, according to their discretion, and they are not bound to fulfil the wishes he may have expressed in this respect. The disposal must be such as will not expose the body to violation, or offend the feelings or endanger the health of the living; and cremation under proper restrictions is allowable. In the case of paupers dying in a parish house, or shipwrecked persons whose bodies are cast ashore, the overseers or guardians are responsible for their burial; and in the case of suicides the coroner has a similar duty. The expenses of burial are payable out of the deceased's estate in priority to all other debts. A husband liable for the maintenance of his wife is liable for her funeral expenses; the parents for those of their children, if they have the means of paying. Recent legislation has principally affected (1) places of burial, (2) mode of burial, (3) fees for burial, and (4) disinterment.

1. The overcrowded state of churchyards and burial grounds gradually led to the passing of a group of statutes known as the Burial Acts, extending from 1852 up to 1900. By these Acts a general system was set up, the aim of which was to remedy the existing deficiencies of accommodation by providing new burial grounds and closing old ones which should be dangerous to health, and to establish a central authority, the Home Office (now for most purposes the Local Government Board) to superintend all burial grounds with a view to the protection of the public health and the maintenance of public decency in burials. The Local Government Board thus has the power to obtain by Order in Council the closing of any burial ground it thinks fit, while its consent is necessary to the opening of any new burial ground; and it also has power to direct inspection of any burial ground or cemetery, and to regulate burials in common graves in statutory cemeteries, and to compel persons in charge of vaults or places of burial to take steps necessary for preventing their becoming dangerous or injurious to health. The vestry of any parish, whether a common law or ecclesiastical one, was thus authorized to provide itself with a new burial ground, if its existing one was no longer available; such ground might be wholly or partly consecrated, and chapels might be provided for the performance of burial service. The ground was put under the management of a burial board, consisting of ratepayers elected by the vestry, and the consecrated portion of it took the place of the churchyard in all respects. Disused churchyards and burial grounds in the metropolis may be used as open spaces for recreation, and only buildings for religious purposes can be built on them (1881, 1884, 1887). The Local Government Act, 1894, introduced a change into the government of burial grounds (consequent on the general change made in parochial government) by transferring, or allowing to be transferred, the powers, duties, property, and liabilities of the burial boards in urban districts to the district councils, and in rural parishes to the parish councils and parish meetings; and by allowing rural parishes to adopt the Burial Acts, and provide and manage new burial grounds by the parish council, or a burial board elected by the parish meeting.

2. The mode of burial is a matter of ecclesiastical cognizance; in the case of churchyards and elsewhere it is in the discretion of the owners of the burial ground. The Local Government Board now makes regulations for burials in burial grounds provided under the Burial Acts; for cemeteries provided under the Public Health Act, 1879. Private cemeteries and burial grounds make their own regulations. Burial may now take place either with or without a religious service in consecrated ground. Before

1880 no body could be buried in consecrated ground except with the service of the Church, which the incumbent of the parish or a person authorized by him was bound to perform; but the canons and prayer-book refused the use of the office for excommunicated persons, *majori excommunicatione*, for some grievous and notorious crime, and no person able to testify of his repentance, unbaptized persons, and persons against whom a verdict of *felo de se* had been found. But by the Burial Laws Amendment Act, 1880, the bodies of persons entitled to be buried in parochial burial grounds, whether churchyards or graveyards, may be buried there, on proper notice being given to the minister, without the performance of the service of the Church of England, and either without any religious service or with a Christian and orderly religious service at the grave, which may be conducted by any person invited to do so by the person in charge of the funeral. Clergymen of the Church of England are also by the Act allowed, but are not obliged, to use the burial service in any unconsecrated burial ground or cemetery, or building therein, in any case in which it could be used in consecrated ground. In cases where it may not be so used, and where such is the wish of those in charge of the service, the clergy may use a form of service approved by the bishop without being liable to any ecclesiastical or temporal penalty. Except as altered by this Act, it is still the law that "the Church knows no such indecency as putting a body into consecrated ground without the service being at the same time performed"; and nothing in the Act authorizes the use of the service on the burial of a *felo de se*, which, however, may now (1882) take place in any way allowed by the Act of 1880. The proper performance of the burial office is provided for by the Public Worship Regulation Act, 1874. Statutory provision is made by the criminal law in this Act for the preservation of order in burial grounds and protection of funeral services.

3. Fees are now payable by custom or under statutory powers on all burials. In a churchyard the parson must perform the office of burial for parishioners, even if the customary fee is denied, and it is doubtful who is liable to pay it. The custom must be immemorial and invariable. If not disputed, its payment can be enforced in the ecclesiastical court; if disputed, its validity must be tried by a temporal court. A special contract for the payment of an annual fee in the case of a non-parishioner can be enforced in the latter court. In the case of paupers and shipwrecked persons the fees are payable by the parish. In other parochial burial grounds and cemeteries the duties and rights to fees of the incumbents, clerks, and sextons of the parishes for which the ground has been provided are the same as in burials in the churchyard. Burial authorities may fix the fees payable in such grounds, subject to the approval of the Home Secretary; but the fees for services rendered by ministers of religion and sextons must be the same in the consecrated as in the unconsecrated part of the burial ground, and no incumbent of a parish or clerk may receive any fee upon burials except for services rendered by them (1900). On burials under the Act of 1880 the same fees are payable as if the burial had taken place with the service of the Church.

4. A corpse is not the subject of property, nor capable of holding property. If interred in consecrated ground, it is under the protection of the ecclesiastical court; if in unconsecrated, it is under that of the temporal court. In the former case it is an ecclesiastical offence, and in either case it is a misdemeanour, to disinter or remove it without proper authority, whatever the motive for such an act may be. Such proper authority is (1) a penalty from the ordinary, where it is to be removed from one consecrated place

of burial to another, and this is often done on sanitary grounds or to meet the wishes of relatives, and has been done for secular purposes, *e.g.*, widening a thoroughfare, by allowing part of the burial ground (disused) to be thrown into it; but it has been refused where the object was to cremate the remains, or to transfer them from a churchyard to a Roman Catholic burial ground; (2) a licence from the Home Secretary, where it is desired to transfer remains from one unconsecrated place of burial to another; (3) by order of the coroner, in cases of suspected crime. There has lately been considerable discussion as to the boundary-line of jurisdiction between (1) and (2), and whether the disinterment of a body from consecrated ground for purposes of identification falls within (1) only, or within both (1) and (2); and an attempt by the ecclesiastical court to enforce a penalty for that purpose without a license has been prohibited by the temporal court.

Burlington, capital of Des Moines county, Iowa, U.S.A., situated in 40° 49' N. lat. and 91° 07' W. long., at an altitude of 533 feet. It has a beautiful situation on the Mississippi river bluffs, which afford fine building sites. It is a railway centre of importance, being entered by the Chicago, Burlington, and Quincy; the Burlington, Cedar Rapids, and Northern; and the Toledo, Peoria, and Western railways. Its river traffic is considerable. The value of its manufactures was, in 1890, \$5,413,000. They consisted principally of lumber, iron and steel, furniture, waggons and carriages. Population (1880), 19,450; (1890), 22,565; (1900), 23,201.

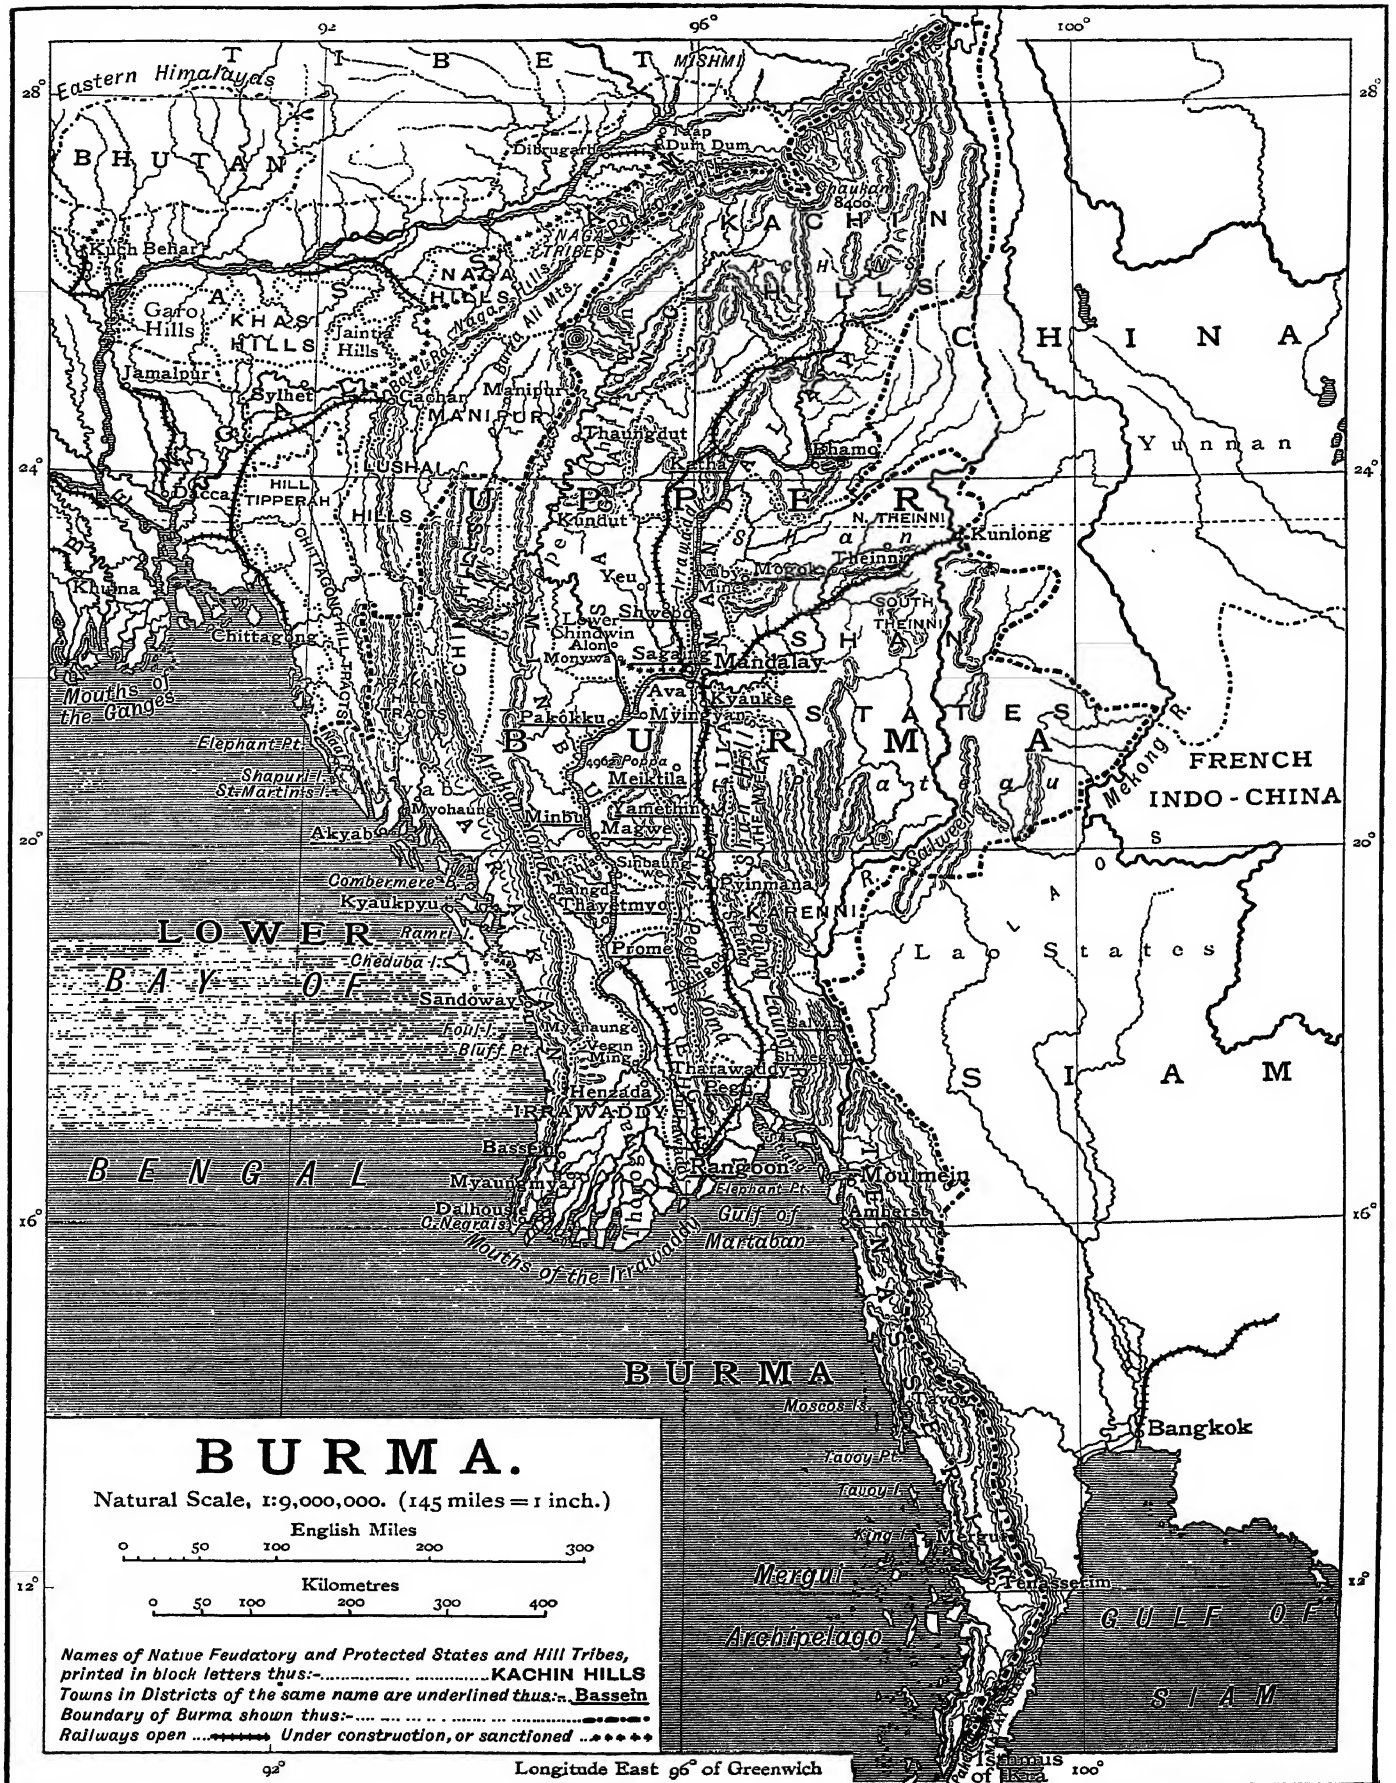

Burlington, a city of Burlington county, New Jersey, U.S.A., situated in 40° 05' N. lat. and 74° 51' W. long., on the east bank of Delaware river and on the Pennsylvania railway, about midway between Philadelphia and Trenton. Population (1880), 6090; (1890), 7264; (1900), 7392.

Burlington, capital of Chittenden county, Vermont, U.S.A., and the largest city in the state, situated on Lake Champlain, where an island and a breakwater make an excellent harbour. It has two railways, the Connecticut Valley and the Rutland. Here is situated the University of Vermont, which (including the State Agricultural College) had in 1900 a staff of 53 professors and instructors and 476 students. Its property is valued at about \$1,000,000, and its income is not far from \$75,000. Besides a large lake trade, principally in lumber, Burlington has extensive and varied manufactures, chiefly of cotton, wool, and wood, and there are fine marble quarries in the immediate neighbourhood. Population (1880), 11,365; (1890), 14,590; (1900), 18,640.

Burma, a lieutenant-governorship of British India, including the former kingdom of independent Burma, as well as British Burma, acquired by the British Indian Government in the two wars of 1826 and 1852. It is divided into Upper and Lower Burma, the former being the territory annexed on 1st January 1886. The province lies to the east of the Bay of Bengal, and covers a range of country extending from the Pakchan river in 9° 55' north latitude to the Naga and Chingpaw, or Kachin hills, lying roughly between the 27th and 28th degrees of north latitude; and from the Bay of Bengal on the west to the Mékong river, the boundary of the dependent Shan States on the east, that is to say, roughly, between the 92nd and 100th degrees of east longitude. The extreme length from north to south is almost 1200 miles,

and the broadest part, which is in about latitude 21° north, is nearly 480 miles from east to west. On the N. it is bounded by the dependent state of Manipur, by the Mishmi hills, and by portions of Chinese territory; on the E. by the Chinese Shan States, portions of the province of Yunnan, the French province of Indo-China, and the Siamese Shan, or Lao States and Siam; on the S. by the Siamese Malay States and the Bay of Bengal; and on the W. by the Bay of Bengal and Chittagong. The coast-line from Taknaf, the mouth of the Naaf, in the Akyab district on the north, to the estuary of the Pakchan at Maliwun on the south, is about 1200 miles. The area of Upper Burma is estimated at 83,473 square miles. This does not include the townships of Minhla, Taingda, and Sinbaungwè, which have been incorporated for administrative purposes with the Lower Burma district of Thayetmyo, and cover about 737 square miles. The area of Lower Burma before the annexation was returned at 87,220 square miles. Thus the total area now is about 87,957 square miles in Lower Burma and 83,473 square miles in Upper Burma, or 171,430 square miles for the whole province. The area of the northern and southern Shan States is computed to be a little over 40,000 square miles.

Since the removal of the artificial political boundary of Upper and Lower Burma the province is divided by its chief physical features. These are the mountain ranges which run north and south and divide the country longitudinally. They are the **Physical features.** Arakan Yoma, the Pegu Yoma, the Paung Laung range, and the Shan hills. The last two ranges in reality form one series. The Arakan Yoma is a continuation of the mountain chain known as the Naga hills, which forms the eastern boundary of Assam, runs nearly due south, and divides the Arakan division from the basin of the Irrawaddy. The Pegu Yoma rises in the highland of Meiktila, south of Mandalay, and keeping parallel to the Arakan Yoma, divides the basin of the Irrawaddy from that of the Sittang. The Paung Laung range is an offshoot from the plateau of the Shan States, and divides the basin of the Sittang from that of the Salween. The Pegu Yoma is only of moderate height, but the Paung Laung range has many high peaks, one rising to about 8000 feet. It sinks away to the plain of Thatôn. The ranges which run fanwise from the high steppes of Tibet are at first almost as sharply defined as the deep gorges in which the rivers run. But as the ribs of a leaf fade away into the texture, so a space is gained, the ridges spread out and fall away. The Irrawaddy and the Mékong gain space for their basins at the expense of the Salween, so that not only is the river itself crushed up in its bed, but its watershed on each side is so compressed, that though it sinks steadily, there is no room to form a plain. This is what causes what is called the Shan plateau, which is properly only the country between the Salween and the Irrawaddy, marked on the west by the abrupt line of hills which begin about Bhamo and run southwards until they sink into the plains of Lower Burma. On the east the plateau is no less sharply defined by the deep narrow rift of the Salween. The average height of the plateau is between 2000 and 3000 feet, but it is seamed and ribbed by mountain ranges which split up and run into one another, leaving space here and there for broad rolling downs or flat-bottomed valleys. The highest peaks are in the north and the south. Loi Ling rises to 8842 feet, and in North Theinni there are many peaks of over 7000 feet, and the same heights are nearly reached in the hills of the Karen country on the south. The majority of the intermediate parallel ranges have an average of between 4000 and 5000 feet, with peaks rising to over 6000. The country east of the Salween is much less open and more hilly; instead

MAP OF BURMA.

Walker & Cockrell del et sc.

of a rolling plateau there is a mass of broken hills. Except in the north, as is the case also west of the Salween, the hills are clad with dense forest. Burma may, therefore, be divided conveniently, but with no great precision, into (a) Northern Burma, including the Chin and Kachin hills, with a thin and miscellaneous alien population; (b) Burma proper, which is practically the valley of the Irrawaddy after it ceases to be a gorge; and (c) the Shan tributary states. Burma proper is practically one great plain; the hills are comparatively mere undulations, and the one considerable peak, Pôppa, is volcanic. Still it is very different from the vast levels that stretch from the base of the Himalayas. It is rather a rolling upland interspersed with alluvial basins and sudden ridges of hills. The delta of the Irrawaddy begins near the village of Yegin Mingy, a few miles south of Myanaung. The sides of the delta measure 179 miles on the west and 126 miles on the east, and the base, measured from Elephant Point to Cape Negrais, is 137 miles in length, with an area of about 12,000 square miles. With the exception of the laterite hills near Myaungmya and the Eocene sandstone range near Thamandewa, in the same township, but more to the south, the whole of this area is a vast plain, gradually sloping down to the sea-shore. It is estimated that at least 2000 square miles, or one-sixth of this area, is below the level of the highest spring tides. This delta, together with the low-lying land to the east of the estuary of the Sittang, in the Pegu and Shwegyin districts, comprises what should from a physical point of view be considered as the lower province. The general aspect of these areas is the same. Till recent times they were covered with dense forest and bamboo jungle, and with water-logged swamps, clothed with elephant grass. The extension of cultivation and the draining of these swamps had changed the aspect of the country within the memory of persons living in 1901.

Climate.—The climate of the delta is cooler and more temperate than in Upper Burma, and this is shown in the fairer complexion and stouter physique of the people of the lower province as compared with the inhabitants of the drier and hotter upper districts as far as Bhamo, where there is a great infusion of other types of the Tibeto-Burman family. North of the apex of the delta and the boundary between the deltaic and inland tracts, the rainfall gradually lessens as far as Nimbu, where what was formerly called the rainless zone commences and extends as far as Katha. Northward of this the annual rainfall increases till at Bhamo the average is about 70 inches, which is almost identical with that of Yegin Mingy. The physical conditions of the country are so varied that to give the mean annual rainfall of Burma would be simply misleading. The table in the next column shows (amongst other things) the mean annual rainfall for ten years in Lower Burma and for five years in Upper Burma. The scanty rainfall in the central zone between the 20th and 22nd parallels is caused chiefly by the Arakan range which drains the clouds, but also in no small degree by the want of forests, which is noticeable in all except the southern districts of this zone.

The temperature varies almost as much as the rainfall. It is highest in the central zone, the mean of the maximum readings in such districts as Magwe, Myingyan, Kyaukse, Mandalay, and Shwebo in the month of May being close on 100° F., while in the littoral and sub-montane districts it is nearly ten degrees less. The mean of the minimum readings in December in the central zone districts is a few degrees under 60° F. and in the littoral districts a few degrees over that figure. In the hilly district of Mogôk (Ruby Mines) the December mean minimum is 36·8° and the mean maximum 79°. The climate of the Chin and Kachin hills and also of the Shan States is temperate. In the shade and off the ground the thermometer rarely rises above 80° F. or falls below 25° F. In the hot season and in the sun as much as 150° F. is registered, and on the grass in the cold weather ten degrees of frost are not uncommon. Snow is seldom seen either in the Chin or Shan hills, but there are snow-clad ranges in the extreme north of the Kachin country. In the narrow valleys of the Shan hills, and especially in the Salween valley, the shade maximum reaches 100° F. regularly for several weeks in April. The rainfall in the hills varies very considerably, but seems to range from about 60 inches in the broader valleys to about 100 inches on the higher forest-clad ranges.

Geology.—The general parallelism of all the streams and hill-ranges gives an appearance of simplicity to the physical geology of the country, but owing to the prevalence of forest it has been found extremely difficult to determine the stratigraphy, and very little can be said to be actually known about the formations occurring. The Pegu Yoma consists entirely of the Miocene group, with beds of later Tertiary age, chiefly sandstone and shale, and the Arakan Yoma and the spurs to eastward and westward of the main range are chiefly of earlier Tertiary age, resting on Cretaceous and Triassic beds, which rise to the surface on the western face of the range. The Carboniferous limestone and its associated beds, together with the Mergui group, appear to run up the line of the Salween, and the main area of metamorphic rock lies to the east of all the other formations. The Burmese gneiss series consists of more or less granitoid gneiss, hornblende gneiss, crystalline limestone, quartz and schists of various kinds. In many places the gneiss becomes a true granite. So far as is known there are two groups, the gneissose formation and limestone, which has been supposed to be of Lower Carboniferous age, but according to recent investigations more probably belongs to the Lower Silurian formations. Metamorphic rocks occupy a large but unexplored area in Upper Burma. They form all the higher ranges in the neighbourhood of Mandalay, and extend throughout a great portion of the country towards the Salween. Farther to the northward they extend from Bhamo to the neighbourhood of T'êng-yüeh (Momiên) in Yunnan. The hills that skirt the Irrawaddy north of Mandalay are Silurian limestone, locally charged with crystalline limestone, which is the matrix of rubies, and metamorphic rocks composed of gneiss and hornblende schist, and opposite Kyaukmyaung greenstone and basalt are found. The Irrawaddy below Ava turns to the west and flows through recent rock formations, while the crystallines continue to the southward, forming a great part of the Shan States and the Karen-ni country, and extending southwards into Tenasserim. The limestone, which is so conspicuous near Moulmein, extends northwards in large hills and ranges into Karen-ni and the Shan States. The abrupt cliffs, full of caves, characteristic of the formation, are very noticeable near Mông Nai (Mynè) and northwards in the same latitude. The same formation is found eastwards of the Salween in Kêngma, Kokang, Chênkang, and probably far northwards. It seems to belong to the Carboniferous series and to be identical, in part at least, with the limestone found in the Mergui archipelago. Until the fossils are better known it is impossible to say whether the Burma series exactly corresponds to the Carboniferous beds of the Himalayas and the

Punjab. They are certainly of the same approximate age. The occurrence of marine fossiliferous rocks of the Carboniferous period at the two extremities of the extra-peninsular area of British India, and the complete absence of any marine Palæozoic fossils within the peninsular region, afford the most striking illustration of the great divergence between the geological history of peninsular India and that of the surrounding countries. The main outcrop of nummulitic rocks extends from the north to the south-east of the Arakan and Chin hills and west of the Irrawaddy. The beds have a general dip to the eastward. There are occasional outcrops of serpentine. The surface rocks are generally shales and sandstone. Coal has been found, but hitherto has not paid for its working. The Irrawaddy valley from the old frontier to the neighbourhood of Ava, where the metamorphic area is entered, consists of the same Tertiary rocks as are traversed by the river in Pegu. About fifty miles N.N.E. of Yenangyaung the extinct volcano of Pôppa rises to a height of 3000 feet above the rolling country, composed of Pliocene sands and gravels. The peak consists of ash breccia, but lava flows, mostly trachytic, form the lower slopes and the surface round the base of the volcano. Amongst these floors are some of a beautiful porphyry with crystals of pyroxene. The volcano is supposed by Mr Blanford to have been in action during the Pliocene period. There is no important expanse of alluvial deposits in the valleys of the Burmese rivers. The beds of all immediately above the deltas are formed in places by older rocks, and there is no such continuous alluvial plain as is found along the courses of the Ganges and Indus. The delta of the Irrawaddy has been formed by elevation by subterranean forces, and not by the accumulation of fluvial beds of recent origin. Some tracts of alluvium occur here and there, but the wide and undulating plains in the neighbourhood of the rivers in Upper Burma are composed, not of river alluvium, but of Pliocene fossil wood deposits, and the hills which bound the river on both sides are chiefly composed of sandstones and shales containing fossil wood and bones. The mud volcanoes, or salsettes, of Minbu appear never to be subject to the violent eruptions of those at Ramree, where stones have been ejected and flames are sometimes emitted.

Population.—In Lower Burma in 1881 there were only three divisions. There are now four, and the number of districts has also increased. The kingdom of Burma was annexed on the 1st January 1886, and the territory so acquired was divided into four commissionerships or divisions. This number has been retained, but the names have been changed, and the number of districts has been increased. The names are given in the tables below. The figures are those of the census of 1891. This was the third census taken in Lower Burma, but the first ever attempted in the Upper Province. The census of 1891 showed the total population of Upper and Lower Burma to be 7,770,914. The population of the Shan States was estimated at 375,961, which, however, is probably very much under the proper total. The figures for the whole province, however, amount under this estimate to 8,098,014 persons. The following statement shows how rapidly the population of Lower Burma has increased since the first census of 1872.

Table showing Increase of Population.

1872.	1881.	Increase.	Per cent.	1891.	Increase.	Per cent.
2,747,148	3,736,771	989,623	36·02	4,658,627	921,856	24·67

The annual rate of increase is 2·23 per cent., which corresponds to 24·67 per cent. for the decade. This means that if this rate of increase be maintained the population of Lower Burma will be doubled in 31·428 years. The area of the province, including the Upper Burma districts, but excluding the Shan States, is returned at 171,630 square miles. There thus are on an average 45·04 persons on each square mile throughout the province. In Lower Burma in 1872 there were only 31·5 persons to the square mile, while in 1881 the returns showed 42·8. In 1891 the density had risen to 52·96 persons to the square mile. The subjoined table gives more fully the return of density for each district in Upper and Lower Burma. It gives the administrative divisions as they have been rearranged in 1899, and not as they were in 1891. Survey meanwhile has reduced the estimated total area to 164,990 square miles.

The density varies almost inversely with the size of the district. Upper Chindwin, with area of 19,000 square miles, a principality two and a half times as large as Wales, has only 5·14 inhabitants to the square mile. Henzada is the most densely populated district, with 195·54 to the square mile. Mandalay district is the most thickly populated in Upper Burma, with 178 to the square mile, but this includes Mandalay city. The rural tracts have only 91·6 to the square mile, whereas Sagaing has 135. Upper and Lower Burma, even if we exclude the Shan States, form the largest province of the Indian Empire, but, with the exception of Assam, they contain the fewest inhabitants, and are the least densely populated. Burma itself is as large as Great Britain together with two islands of the size of Ireland. The average size of a district in Burma, including the Rangoon district, the area of which is only 19 square miles, is 4761·94 square miles, that is to say, larger than the three counties of Kent, Sussex, and Hampshire. In the whole province, as well as in Lower Burma, by far the greater part of the population lives in villages containing less than 500 inhabitants; 57·9 per cent. lived in villages containing less than

200 inhabitants. Villages between 200 and 500 inhabitants number 38·4 per cent. of the total population. Of villages containing 1000 and less than 2000 inhabitants there were only 376 in 1891, and 202 of these were in Lower Burma. Of villages containing between two and three thousand inhabitants there were only 41 in all Burma, and 21 of these were in Lower Burma. Of towns and villages whose inhabitants number 3000 and more, and less than 5000, there were 21 with a total population of 76,565, or 1·006 per cent. of the total population. In 1891 the population of all towns containing upwards of 5000 inhabitants amounted to 540,672, or 11·6 per cent. of the total population; there were 25 of these in Lower Burma.

In 1891 there were 3,887,156 males and 3,740,412 females, or 962 females for every 1000 males. In Lower Burma the disparity between males and females is even more strongly marked, since there were only 891 females for every 1000 of the opposite sex. In Upper Burma the females outnumber the males, and we find 1084 women for every 1000 men. The average number of male births to 1000 female births was 1067. Lower Burma thus falls into the category of immigration countries.

Table showing Distribution of Population per 10,000 of Total Population.

Division.	Burmese.	Môn or Talang.	Tal or Shan.	Karen (Pwo).	Karen (Sgau).	Karen-ni, Red Karen.	Chin.	Chinese.	Hindu Castes.	Mussulman Tribes.	Sikhs.	Chingpaw and Kachins.

Total Upper Burma .	3587·4	1·93	95·0	2·72	·610	·064	28·48	9·4	38·1	50·7	3·3	2·7
Total Province . .	7588·6	614·96	236·2	408·12	294·120	2·164	149·53	54·5	225·42	319·8	3·99	2·85

The pastoral and agricultural classes comprise 6·415 out of every 10,000 persons of both sexes, and only a very small proportion of these are employed in stock-breeding. The next most important class is that of persons engaged in the preparation and supply of food. Of these, the fishermen, grain-dealers, fruit and vegetable sellers, are for the most part Burmese, the stock-breeders and butchers are chiefly Choliars or Chittagonians. Handicraftsmen, wood-carvers, lacquerers, makers of textile fabrics, boat-builders, workers in metal, potters, carpenters, form only a very small percentage of the total population. Of monks or pōngyiis there were in 1891 in Lower Burma 13,613, and in Upper Burma 11,894. Of upazins, or probationers, there were 6668 in Lower Burma, and 14,109 in Upper Burma. A Burman is a jack-of-all trades, and a very large number of them work at different times at all sorts of employments. There is no leisured class to speak of. There were no more than 652 males who could be taken to correspond with the leisured class of European countries.

The Malthusian maxim that population tends to outgrow the means of support does not yet apply to Burma. The soil is too rich, and there is too great a superabundance of culturable land. War and epidemic disease did not influence the country even in Upper Burma to any appreciable extent during the period 1880-1900. Famine has never been known in Lower Burma, and failure of crops and deficient rainfall in Upper Burma only tend to swell the tide of emigration to the more favoured districts of the lower province.

Turning now to consider the births and deaths, these in Lower Burma were as follows :—

	Births.			Deaths.			Net Increase.		Total Increase.
	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.	
1881	38,012	35,742	73,754	31,966	26,170	58,136	6046	9,572	15,618
1885	48,059	45,163	93,222	40,539	32,133	72,672	7520	13,080	20,550
1890	43,918	40,851	84,769	36,091	27,500	63,591	7827	13,351	21,178

For the period of ten years the natural growth by excess of births over deaths was only 57,346, or an increase at the rate of 5·06 per cent. The registration of births and deaths is still only very partial in Upper Burma. In 1898-99 the average birth-rate throughout Lower Burma amounted to 34·11, and the death-rate to 26·13 in every thousand of the population. The proportion of deaths was practically the same as in the previous year, 26·26, while the number of births was greater than in any previous year, the 1897 figure being 31·82. The natural increment of the population only accounts for 21·9 of the total growth. The surplus of 101,433 shown (an increase of 2·77 per cent.) is caused by the excess of immigrants over emigrants. Between the years 1887 and 1891 the total number of immigrants was 558,123, and of emigrants 312,211, so that there was an average gain of 29,182 persons every year. The following table shows that this rate remains fairly constant in the number of immigrants and emigrants who pass through the principal ports of the province :—

	1897-98.		1898-99.	
	Emigrants.	Immigrants.	Emigrants.	Immigrants.
Akyab.	14,359	15,925	14,972	16,407
Rangoon	75,998	106,374	91,033	132,177
Moulmein	847	644	743	596

Of the 4,658,627 people in Lower Burma, 3,391,590 are Burmese and Talaings, 630,700 are Karens, and 356,087 are races from India. Europeans and Eurasians number 15,338, Shans, 94,302; Chinese, 31,941. The increase in the number of Burmese and Talaings in ten years was 22·58 per cent., of Karens 21·7 per cent., of Europeans 20·2 per cent., and of Chinese 146 per cent. If we add the population of Upper Burma, there are in the whole province 6,129,182 Burmese and Talaings; 633,657 Karens; 95,571 Chins; 206,794 Shans; 432,639 natives of India; 37,407 Chinese; and 20,177 Europeans and Eurasians.

The province as a division of the Indian Empire is administered by a Lieutenant-Governor, first appointed 1st

Government.

May 1897, with a legislative council of nine members, five of whom are officials. There are, besides, a chief secretary, revenue secretary, secretary and two under-secretaries, a public works department secretary with two assistants. The revenue administration of the province is superintended by a financial commissioner, assisted by two secretaries, and a director of land records and agriculture, with a land records departmental staff. There is a chief court for the province with a chief justice

and three justices, established in May 1900. Other purely judicial officers are the judicial commissioner for Upper Burma, and the civil judges of Mandalay and Moulmein. There are four commissioners of revenue and circuit, and nineteen deputy commissioners in Lower Burma, and four commissioners and seventeen deputy commissioners in Upper Burma. There are two superintendents of the Shan States, one for the northern and one for the southern Shan States, and an assistant superintendent in the latter; a superintendent of the Arakan Hill tracts and of the Chin Hills, and a Chinese political adviser taken from the Chinese consular-service. The police are under the control of an inspector-general, with deputy inspector-general for civil and military police, and for supply and clothing. The Education Department is under a director of public instruction, and there are three circles—eastern, western, and Upper Burma, each under an inspector of schools.

The Burma forests are divided into three circles each under a conservator, with twenty-one deputy conservators. There are also a deputy postmaster-general, chief superintendent and four superintendents of telegraphs, a chief collector of customs, three collectors and four port officers, and an inspector-general of jails. At the principal towns

benches of honorary magistrates, exercising powers of various degrees, have been constituted. There are forty-one municipal towns, fourteen of which are in Upper Burma. The commissioners of division are *ex officio* sessions judges in their several divisions, and also have civil powers, and powers as revenue officers. They are responsible to the lieutenant-governor, each in his own division, for the working of every department of the public service, except the military department, and the branches of the administration directly under the control of the supreme Government. The deputy commissioners perform the functions of district magistrates, district judges, collectors and registrars, besides the miscellaneous duties which fall to the principal district officer as representative of Government. Subordinate to the deputy commissioners are assistant commissioners, extra-assistant commissioners and myoōks, who are invested with various magisterial, civil, and revenue powers, and hold charge of the townships, as the units of regular civil and revenue jurisdiction are called, and the sub-divisions of districts, into which most of these townships are grouped. Among the salaried staff of officials, the township officers are the ultimate representatives of Government who come into most direct contact with the people. Finally, there are the village headmen, assisted in Upper Burma by elders, variously designated according to old custom. Similarly in the towns, there are headmen of wards and elders of blocks. In Upper Burma these headmen have always been revenue collectors. The system under which in towns headmen of wards and elders of blocks are appointed is of comparatively recent origin, and is modelled on the village system.

The Shan States were declared to be a part of British India by notification in 1886. The Shan States Act of 1888 vests the civil, criminal, and revenue administration in the chief of the state, subject to the restrictions specified in the *sanad* or patent granted to him. The law to be administered in each state is the customary law of the state, so far as it is in accordance with justice, equity, and good conscience, and not opposed to the spirit of the law in the rest of British India. The superintendents exercise general control over the administration of criminal justice, and have power to call for cases, and to exercise wide revisionary powers. Criminal jurisdiction in cases in which either the complainant or the defendant is a European, or American, or a Government servant, or a British subject not a native of a Shan State, is withdrawn from the chiefs and vested in the superintendents and assistant-superintendents.

Neither the superintendents nor the assistant-superintendents have power to try civil suits, whether the parties are Shans or not. In the Myelat division of the southern Shan States, however, the criminal law is practically the same as the law in force in Upper Burma, and the Ngwekunhmus, or petty chiefs, have been appointed magistrates of the second class. The chiefs of the Shan States are of three classes:—1. Sawbwass; 2. Myosas; 3. Ngwekunhmus. The last are found only in the *Myelat*, or border country between the southern Shan States and Burma. There are fifteen Sawbwass, sixteen Myosas, and thirteen Ngwekunhmus in the Shan States proper. Two Sawbwass are under the supervision of the commissioner Mandalay division, and two under the commissioner of the Sagaing division. The states vary enormously in size, from the 12,000 square miles of the Trans-Salween State of Keng Tung, to the 3.95 square miles of Nam Hkôm in the Myelat. The latter contained only 41 houses with 210 inhabitants in 1897. There are five states, all Sawbwasships, under the supervision of the superintendent northern Shan States, besides an indeterminate number of Wa States and communities of other races beyond the Salween river. The superintendent, southern Shan States, supervises thirty-nine, of which ten are Sawbwasships. The headquarters of the northern Shan States are at Lashio, of the southern Shan States at Taung-gyi.

The states included in eastern and western Karen-ni are not part of British India, and are not subject to any of the laws in force in the Shan States, but they are under the supervision of the superintendent southern Shan States.

The northern portion of the Karen Hills is at present dealt with on the principle of political as distinguished from administrative control. The tribes are not interfered with as long as they keep the peace. What is specifically known as the Kachin Hills, the country taken under administration in the Bhamo and Myit-Kyina districts, is divided into forty tracts. Beyond these tracts there are many Kachins in Katha, Mông Mit, and the northern Shan States, but though they are often the preponderating, they are not the exclusive population. The country within the forty tracts may be considered the Kachin Hills proper, and it lies between 23° 30' and 26° 30' N. lat., and 96° and 98° E. long. Within this area the petty chiefs have appointment orders, the people are disarmed, and the rate of tribute per household is fixed in each case. Government is regulated by the Kachin Hills regulation. Since 1894 the country has been practically undisturbed, and large numbers of Kachins are enlisted, and ready to enlist in the military police, and seem likely to form as good troops as the Gurkhas of Nepal.

The Chin Hills were not declared an integral part of Burma until 1895, but they now form a scheduled district. The chiefs, however, are allowed to administer their own affairs, as far as may be, in accordance with their own customs, subject to the supervision of the superintendent of the Chin Hills.

Religion.—Buddhists make up more than 90 per cent.; Mussulmans, 3.125; spirit-worshippers and Hindus about 2.25; and Christians, about 1.25 per cent. of the total population of Upper and Lower Burma. The large nominal proportion of Buddhists is deceptive. The Burmese are really as devoted to demonolatry as the hill-tribes who are labelled plain spirit-worshippers. The actual figures of the various religions, according to the census of 1891, are as follows:—

Buddhists	. 6,888,075	Sikhs	. 3164
Spirit-worshippers.	168,449	Jews	. 351
Hindus	171,577	Parsees	. 96
Mussulmans	253,031	Not returned	. 49
Christians	120,768		

An analysis shows that not quite two in every thousand Burmese profess Christianity, and there are about the same number of Mahomedans among them. It is admitted by the missionaries themselves that Christianity has progressed very slowly among the Burmese in comparison with the rapid progress made amongst the Karens. It is amongst the Sgaw Karens that the greatest progress in Christianity has been made, and the number of spirit-worshippers among them is very much smaller. The number of Burmese Christians is considerably increased by the inclusion among them of the Christian descendants of the Portuguese settlers of Syriam deported to the old Burmese Tabayin, a village now included in the Ye-u subdivision of Shwebo. These Christians returned themselves as Burmese. The forms of Christianity which make most converts in Burma are the Baptist and Roman Catholic faiths.

Education.—Compared with other Indian provinces, and even with some of the countries of Europe, Burma takes a very high place in the returns of those able both to read and write. Taking the sexes apart, though women fall far behind men in the matter of education, still women are better educated in Burma than in the rest of India. The average number of each sex in Burma per thousand is: literates, male, 450; female, 29; illiterates, male, 550; female, 971. The number of literates in Bengal is: male, 47; female, 1. The proportion is reduced by the number of

immigrants from India, who are mostly illiterate. The degree of education prevailing amongst every thousand persons of each sex who profess one of the five chief religions of the province shows Burma still more favourably.

Religion.	Illiterate.		Learning.		Literate.	
	Male.	Fem.	Male.	Fem.	Male.	Fem.
Buddhist.	443	970	74	5	483	25
Spirit-worshippers	922	997	6	1	72	2
Hindus	757	960	13	8	230	32
Mussulmans	746	961	25	9	229	30
Christians	471	723	79	51	450	226

The fact that in Upper Burma the proportion of literates is nearly as high as, and the proportion of those under instruction even higher than, that of the corresponding classes in Lower Burma, is a clear proof that in primary education, at least, the credit for the superiority of the Burman over the native of India is due to indigenous schools. If we take the numbers of those of 25 years and over, the proportion per thousand is more clear and just. The numbers for Lower Burma were: literates, male, 602; female, 34; illiterates, male, 398; female, 966. For Upper Burma: literates, male, 627; female, 16; illiterates, male, 373; female, 984. It was not till 1890 that the Education department took action in Upper Burma. It was then ascertained that there were 684 public schools with 14,133 pupils, and 1664 private schools with 8685 pupils. It is worthy of remark that of these schools 29 were Mahomedan, and that there were 176 schools for girls in which upwards of 2000 pupils were taught. There are three circles—Eastern, Central, and Upper Burma. For the special supervision and encouragement of indigenous primary education in monastic and in lay schools, each circle of inspection is divided into sub-circles corresponding with one or more of the civil districts, and each sub-circle is placed under a deputy-inspector or a sub-inspector of schools. There are nine standards of instruction, and the classes in schools correspond with these standards. In Upper Burma all educational grants are paid from Imperial funds; there is no cess as in Lower Burma. Grants-in-aid are given according to results. There is only one college, which is affiliated to the Calcutta University. The number of students at this Rangoon college was 25 in 1890-91. There were 70 undergraduates in 1897-98, and 95 in 1898-99. In the latter year the college produced seven B.A.'s (one with honours in English) out of eight candidates. There are three normal schools and two survey schools, one in Upper and one in Lower Burma. There are 44 Government scholarships divided between the various school and university standards, besides special scholarships for students of medicine, open to both men and women, tenable in Madras or Calcutta. There are missionary schools amongst the Chins, Kachins, and Shans, and a school for the sons of Shan chiefs at Taung-gyi in the southern Shan States. A *Patamabyan* examination for marks in the Pali language was first instituted in 1896 and is held annually. The number of candidates has not hitherto been large.

Finance.—The gross revenue of Lower Burma from all sources in 1871-72 was Rs.1,86,34,520, of which Rs.1,21,70,530 was from Imperial taxation, Rs.3,73,200 from provincial services, and Rs.10,90,790 from local funds. The land revenue of the province was Rs.34,45,230. In Burma the cultivators themselves continue to hold the land from Government, and the extent of their holdings averages about five acres. The land tax is supplemented by a poll-tax on the male population from 18 to 60 years of age, with the exception of immigrants during the first five years of their residence, religious teachers, schoolmasters, Government servants, and those unable to obtain their own livelihood. In 1890-91 the revenue of Lower Burma had risen to Rs.2,08,38,872 from imperial taxation, Rs.1,55,51,897 for provincial services, and Rs.12,14,596 from incorporated local funds. The expenditure on the administration of Lower Burma in 1870-71 was Rs.49,70,020. In 1890-91 it was Rs.1,58,48,041. In 1897-98 the gross revenue had risen to Rs.3,87,05,972, and in 1898-99 to Rs.4,26,05,080. In Upper Burma the chief source of revenue is the *Thathameda*, a tithe or income tax which was instituted by King Mindôn, and was adopted by the British very much as they found it. For the purpose of the assessment every district and town is classified according to its general wealth and prosperity. As a rule the basis of calculation was 100 rupees from every ten houses, with a 10 per cent. deduction for those exempted by custom. When the total amount payable by the village was thus determined, the village itself settled the amount to be paid by each individual householder. This was done by *Thamadis*, assessors, usually appointed by the villagers themselves. Other important sources of revenue are the rents from State lands, forests, and miscellaneous items such as fishery, revenue, and irrigation taxes. In 1886-87, the year after the annexation, the amount collected in Upper Burma from all

sources was twenty-two lakhs of rupees. In the following year it had risen to fifty lakhs. Much of Upper Burma, however, remained disturbed until 1890. The figures for 1890-91, therefore, show the first really regular collection. The amount then collected was Rs. 87,47,020. In 1893-94 the total collections were Rs. 1,05,01,914. In 1896-97 the gross receipts were Rs. 1,31,26,451, and in 1898-99 Rs. 1,39,43,991. The following statement exhibits the gross receipts and expenditure of the province during the years 1897-98 and 1898-99, distributed between imperial, provincial, incorporated local, excluded local, and municipal funds. These include the transactions of the Rangoon municipality and the Rangoon Port Trust, although these funds do not bank with Government.

	1897-98.		1898-99.	
	Receipts.	Expenditure.	Receipts.	Expenditure.
	Rs.	Rs.	Rs.	Rs.
Imperial .	3,02,02,197	84,51,802	3,38,45,001	86,64,995
Provincial .	3,16,02,179	2,99,07,823	3,41,28,971	3,00,14,084
Incorporated Local .	20,28,696	19,47,947	21,45,511	21,07,037
Excluded Local .	23,59,059	20,54,133	26,31,022	27,16,160
Municipal .	22,67,945	22,70,066	24,34,175	24,73,718
	6,84,60,076	4,46,31,771	7,51,84,680	4,59,75,994

Defence.—In 1871, 5016 fighting men, Europeans and natives, were maintained at a total cost of Rs. 27,62,000, and the strength of the police in the same year was 5319. In 1898-99 the strength of the troops in Burma was: Europeans 4234, and natives 6493—a total of 10,727 men. These were nearly equally divided between the Rangoon and the Mandalay district commands, with 1262 natives in the southern Shan States command. Besides these there were 14,941 military police, whose cost was Rs. 48,46,448. The civil police amounted to 15,558 civil constables. There were besides 2530 volunteers, 366 of whom were cadets. They consisted of the Rangoon Port Defence volunteers, comprising artillery, naval, and engineer corps, the Moulmein artillery, the Moulmein, Rangoon, Railway, and Upper Burma rifles. Four Indian marine vessels ply on the Irrawaddy and the Chindwin rivers, and the provincial marine consists of 28 launches in Lower Burma and 30 in Upper Burma. These carry troops, specie, cattle, ammunition, and stores. Their cost was Rs. 1,48,485 in Lower Burma, and Rs. 2,45,163 in Upper Burma. There is a battery for the defence of the harbour at Monkey Point at the junction of the Sittang with the Rangoon river.

Minerals and Mining.—The tin mines in Lower Burma remain in much the same condition as they were in 1880. They are still worked by natives, but a company is being formed to work the mines in the Maliwun township of Mergui by European methods. The chief mines and minerals are in Upper Burma. The jade mines of Upper Burma are now practically the only source of supply of that mineral, which is in great demand over all China. The mines are situated beyond Kamaing, north of Mogaung in the Myitkyina district. The miners are all Kachins, and the right to collect the jade duty of 3½ is farmed out by Government to a lessee, who has hitherto always been a Chinaman. The amount obtained has varied considerably. In 1887-88 the rent was Rs. 50,000. This dwindled to Rs. 36,000 in 1892-93, but the system was then adopted of letting for a term of three years, and in 1898 Rs. 41,100 was obtained. The amount extracted varies from 2000 to 3000 cwts. The value varies enormously according to colour, which should be a particular shade of dark green. Semi-transparency, brilliancy, and hardness are, however, also essentials. The old river mines produced the best quality. The quarry mines on the top of the hill near Tawmaw produce enormous quantities, but the quality is not so good.

The most important ruby-bearing area is the Mogök stone tract, in the hills about 60 miles east of the Irrawaddy and 90 miles N.N.W. of Mandalay. The right to mine for rubies by European methods and to levy royalties from persons working by native methods was leased to the Burma Ruby Mines Company, Limited, in 1889, and the lease was renewed in 1896 for 14 years at a rent of Rs. 3,15,000 a year plus a share of the profits. The rent was reduced permanently in 1898 to Rs. 2,00,000 a year, but the share of the profits taken by Government was increased from 20 to 30 per cent. The value of the rubies found in 1898 was Rs. 8,69,252, and a dividend of 5 per cent was then paid for the first time. There are other ruby mines at Nanyaseik in the Myitkyina district and at Sagyin in the Mandalay district, where the mining is by native methods under license-fees of Rs. 5 and Rs. 10 a month. They are, however, only moderately successful. Gold is found in most of the rivers in Upper Burma, but the gold-washing industry is for the most part spasmodic in the intervals of agriculture. There is a gold mine at Kyaukpazat in the Mawnaing circle of the Kaltra district, where the quartz is crushed by machinery and

treated by chemical processes. Work was begun in 1895, and the yield of gold in that year was 274 oz., which increased to 893 oz. in 1896-97, and to 1120 oz. in 1898-99. Coal is found in several fields in the Shan States, on the Upper Chindwin, and at Mergui, but it is of no very high quality. The principal seats of the petroleum industry are Yenangyaung in the Magwe, and Yenangyat in the Pakökku districts. The yield of the former wells in 1898 was 15,484,301 gallons, and of the Yenangyat field 6,036,088 gallons. The latter field is extending rapidly. In the Akyab district 58,025 gallons were produced, and in Kyaukpyu 106,549 gallons. The wells have been worked for a little over a century by the natives of the country. The Burma Oil Company since 1889 has worked by drilled wells on the American or cable system. The output continues steadily to increase, and there are no signs of exhaustion, but, on the other hand, there seems no prospect of the discovery of flowing wells.

Amber is extracted by Kachins in the Hukawng valley beyond the administrative border, but the quality of the fossil resin is not very good. The amount exported varies considerably. In 1897 it was valued at Rs. 2,330, in 1898 at Rs. 4,990, and in 1899 at Rs. 15,915. Tourmaline, or rubellite, is found on the borders of the Ruby Mines district and in the Shan State of Mong Long. Steatite to the amount of 19 tons, valued at Rs. 7,995, was extracted in 1899 from the Arakan hill quarries. Salt is manufactured at various places in Upper Burma, notably in the lower Chindwin, Sagaing, Shwebo, Myingyan, and Yamethin districts, as well as at Mawhko in the Shan State of Thibaw. Iron is found in many parts of the hills, but is so far only worked by inhabitants of the country. A good deal is extracted and manufactured into native implements at Pang Long in the Lägya (Laihka) Shan State. Lead is extracted by a Chinese lessee from the mines at Bawzaing (Maw-sön) in the Myelat, southern Shan States. The ore is rich in silver as well as in lead.

Agriculture.—Rice continues to be the staple product of the province both in Upper and Lower Burma. In 1871-72 there were 1,836,021 acres devoted to its cultivation in Lower Burma. In 1898-99 the area cropped in Lower Burma was 6,478,339 acres, of which 6,098,956 acres were under paddy. Maize covered 11,707 acres, and other food-grains, including pulse, 34,781 acres. Tilseed covered 24,822 acres; sugar-cane, 10,020 acres; cotton, 12,078 acres; tobacco, 29,328 acres; orchard and garden produce covered 356,777. In all of these, except cotton, there was an increase. In Upper Burma rice is also the chief crop, but the proportion to other crops is not nearly so overwhelming. The total area cropped was 3,419,703 acres in 1899, and of this 1,502,736 acres were under rice; wheat, 12,638 acres; millet (cholum or jowar), 713,531 acres; millet (cumbu or bajra), 30,843 acres; maize, 75,926 acres; grain (pulse), 56,129; other food-grains, including pulse, 169,627; tilseed, 404,884 acres; condiments and spices, 19,007 acres; sugar, 4847 acres; cotton, 134,243 acres; tea, 1221 acres; tobacco, 34,988 acres; fodder crops, 22,445 acres; orchards and garden produce, 44,943 acres; other crops were barley, sago or mandua, linseed and other oil-seeds, various fibres, indigo and other dye crops, and miscellaneous food and non-food crops, the last covering 167,410 acres. The total area cultivated in Lower Burma by irrigation from canals, tanks, wells, and other sources in 1899 was 5005 acres. In Upper Burma in the same year it amounted to 684,189 acres, of which 126,773 acres were in the Kyaukse district, and 112,701 acres in the Magwe district. Other districts largely dependent on irrigation were Meiktila, Yamethin, Minbu, Mandalay, and Sagaing. The old national irrigation system has been largely repaired and extended since the annexation. Of the total area of Lower Burma, 53,476,480 acres, the area cropped in 1899 was 6,478,339 acres, the area not available for cultivation was 25,828,221 acres; 4,813,995 acres were covered with forests, and the cultivable area, other than fallow, amounted to 15,765,976 acres. The total area of Upper Burma is 54,395,395 acres. Of this 3,901,140 acres are in feudatory and tributary states, and for 2,644,713 acres no returns exist. Of the remaining 47,849,642 acres the net area cropped in 1899 was 3,419,703 acres; forests covered 4,836,138 acres; 28,945,014 acres were not available for cultivation; the cultivable waste, other than fallow, amounted to 9,197,905 acres. The current fallow was 1,703,452 acres. Of agricultural stock there were in 1898-99 in Lower Burma 566,312 bulls and bullocks, 302,119 cows, 272,588 bull buffaloes, 228,383 cow buffaloes, 560,017 young stock, 2310 sheep, 35,672 goats, 12,144 horses and ponies, 463,122 ploughs, and 195,207 carts. In Upper Burma there were 639,175 bulls and bullocks, 611,203 cows, 78,404 bull buffaloes, 96,206 cow buffaloes, 599,871 young stock, 4044 sheep, 27,817 goats, 21,076 horses and ponies, 2104 mules and donkeys, 53 camels, 365,518 ploughs, and 222,580 carts.

Forests.—In 1870-71 the State reserved forests covered only 133 square miles, all in the Rangoon division. The total receipts from the forests then amounted to Rs. 7,72,400. In 1889-90 the total area of reserved forests in Lower Burma was 5574 square miles, and the gross revenue was Rs. 31,34,720, and the expenditure was Rs. 13,31,930. The work of the forest department did not begin in

Upper Burma till 1891. At the end of 1892 the reserved forests in Upper Burma amounted to 1059 square miles. On 30th June 1896 the reserved area amounted to 5438 square miles. At the close of 1899 the area of the reserved forests in the whole province amounted to 15,669 square miles, 962 square miles being the addition made during 1898-99. The revenue in 1898-99 amounted to Rs.83,50,888, and the charges to Rs.23,62,055, showing a surplus of Rs.59,88,833. The receipts for the previous year had been Rs.72,15,257, and the average receipts for the preceding five years had been Rs.61,02,382. The proportion of the surplus to the gross revenue for that period showed a percentage of 67·48.

Fisheries.—The gross demand of fishery revenue in Lower Burma in 1898-99 was Rs.18,77,933, an increase of Rs.1,37,875 over the figures of the preceding year. To this total fishery leases contributed Rs.16,52,227, an advance of Rs.1,43,713, and licenses for fishing implements Rs.2,25,706, or Rs.5,838 less than in 1897-98. In the Irrawaddy division, where most fishing is done, the revenue rose by over a lakh of rupees, and in the Pegu division by Rs.37,405. In Upper Burma the gross revenue derived from fisheries increased from Rs.3,02,216 to Rs.3,05,372.

Manufactures.—There were in 1871-72 twenty-six steam rice-mills in the province. Five years earlier there were only three. The total number of factories in 1889-90 was 125. In 1898-99 there were 136. The mechanical power in every case is steam, and the factories are mostly either rice or timber mills, and in some cases both combined. In 1898-99 two new rice mills were opened in the Toungoo district, and one each in Hanthawaddy, Henzada, and Rangoon town. Saw-mills were established in Toungoo, Bassein, Rangoon, and Hanthawaddy, an iron and brass factory at Moulmein, and a cotton factory in the Thayetmyo district. The average daily number of operatives in 1899 was 16,181, of whom only 110 were females. The manufacture locally of silk and cotton stuffs is steadily dying out, and aniline is superseding the old natural dyes. Silver work of peculiar and delicate workmanship is perhaps extending, and the pottery, brass, and copper work and lacquer work remain stationary.

Commerce.—The following table shows the progressive value of the trade of Burma since 1871-72:—

Year.	Imports.	Exports.	Total.
	Rs.	Rs.	Rs.
1871-72	3,15,79,860	3,78,02,170	6,93,82,030
1881-82	6,38,49,840	8,05,71,410	14,44,21,250
1891-92	10,50,06,247	12,67,21,878	23,17,28,125
1898-99	11,68,08,404	16,46,67,442	28,14,75,846

Of the total sea-borne trade of the province 76·5 per cent. passed through Rangoon in 1898-99, as compared with 78·5 in 1897-98. Rice and timber are by far the most important articles of sea-borne exports. The contributions made by the various kinds of country produce were in 1898-99 in the following proportions:—

Rice	82·04	Raw cotton . . .	1·20
Teak	7·79	Jade-stone . . .	·54
Cutch	1·09	Rice-bran . . .	2·09
Raw hides . . .	1·17	Other articles . .	3·28
Raw caoutchouc .	·80		

The chief articles of import are cotton twist and yarn, cotton, silk and woollen piece goods, crockery, hardware, gunny bags, sugar, tobacco, and liquors.

The system of inland trade registration was in a more or less experimental and progressive state until 1892, when it was thoroughly revised. In the year 1898-99 there were twenty registration stations in Upper Burma, and nine in Lower Burma. The total trade registered at these stations had an aggregate value of Rs.2,89,23,907, which showed the slight increase on the previous year of Rs.46,304. A review of the trade returns of the previous six years, however, shows that the trade was expanding. The value of the total trade during the three years ending with March 1899 was 35·07 per cent. in excess of that registered in the three years ending with March 1896. Of this increase exports advanced more rapidly than imports, and the expansion under both heads was greater in Upper Burma than in Lower Burma—that is, more with the Shan States and Western China than with Siam and Karen-land. The value of the trade with Western China in 1898-99 was Rs.36,68,610, showing an increase of 2·8 per cent. over 1897-98, but considerably less than in 1896-97, when Rs.39,57,936 was registered. Trade with the northern Shan States showed a growth during the year from Rs.64,29,744 to Rs.72,96,789. In the southern Shan States the figures were Rs.94,60,636 for 1898-99, against Rs.93,59,613 for the preceding year.

Shipping and Navigation.—The number of vessels engaged in the sea-borne trade in 1889-90 was 6435, with a tonnage of 3,360,045. Vessels entered, 2619; tonnage, 1,016,373; vessels cleared, 2469; tonnage, 1,011,880. The traffic to and from Burma through the Suez Canal was: Vessels entered, 40; tonnage, 62,618; vessels

cleared, 169; tonnage, 245,017. In 1898-99 the number of vessels and the aggregate tonnage engaged in the sea-borne trade was: Vessels, 6344; tonnage, 4,133,436. These were distributed in the following proportions:—

Port.	Entered.		Cleared.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
Rangoon . . .	1225	1,417,373	1235	1,431,773
Akyab . . .	290	167,158	282	166,752
Bassein . . .	40	78,123	42	78,058
Moulmein . .	674	263,089	712	270,418
Smaller ports .	922	130,477	922	130,220

376 steamers with tonnage aggregating 625,030 tons, and 130 sailing vessels with a total tonnage of 98,918, entered; and 428 steamers with a tonnage of 789,246, and 139 sailing vessels with a tonnage of 110,702, cleared.

Internal Communications.—In 1871-72 there were 814 miles of road in Lower Burma, but the chief means of internal communication was by water. Steamers plied on the Irrawaddy as far as Thayetmyo. The vessels of the Irrawaddy Flotilla Company now ply to Bassein and to all points on the Irrawaddy as far north as Bhamo, and in the dry weather to Myitkyina, and also on the Chindwin as far north as Kinpat, and to Homalin during the rains. The length of roads has not greatly increased in Lower Burma, where there are now about 70 miles of navigable canals, but there has been a great deal of road construction in Upper Burma. At the end of the year 1898-99 there were in the whole province 6032 miles of road, 1322 of which were metalled and 1179 unmetalled, but bridged and drained, and the remainder partially bridged and drained. But the chief advance in communications has been in railway construction. The first railway from Rangoon to Prome, 161 miles, was opened in 1877, and that from Rangoon to Toungoo, 166 miles, was opened in 1884. Since the annexation of Upper Burma this has been extended to Mandalay, and the Mu Valley railway has been constructed from Sagaing to Myitkyina, a distance of 752 miles from Rangoon. The Mandalay-Kunlōng railway is under construction, and trains run from Mandalay to Nawnghkio, a distance of 72 miles. The Sagaing-Mōnya-Alū branch and the Meiktila-Myingyan branch were opened to traffic during 1900, so that the length of line now approaches 1200 miles. The Mandalay-Kunlōng railway will be carried at least as far as Lashio, 180 miles, and branches between Bassein and Henzada and Tharawaddy and Henzada are being surveyed, as is also the bridge over the Irrawaddy at Sagaing, where there is now a steam ferry.

Posts and Telegraphs.—There were, in 1899, 34 head post offices, 88 sub-offices, and 64 branch offices, a total of 186 imperial post offices for the province, besides 1 district sub-office and 89 branch offices, making 276 in all. There were 176 post offices doing savings bank business, with 47,652 accounts. In all 17,417,670 postal articles, including parcels, were delivered in the year. Of the articles received for delivery 18 per cent. were addressed in Burmese and Chinese. There were 238 telegraph offices open for paid telegrams in 1898-99. The length of telegraph lines in the province was 5296 miles, and the total length of wire 12,148 miles.

History.—In 1862 the province of British Burma, the present Lower Burma, was formed with Sir Arthur Phayre as chief commissioner. In 1867 a treaty was concluded at Mandalay providing for the free intercourse of trade and the establishment of regular diplomatic relations. King Mindōn died in 1878, and was succeeded by his son King Thibaw. Early in 1879 he excited much horror by executing a number of the members of the Burmese royal family, and relations became much strained. The British resident was withdrawn in October 1879. The government of the country rapidly became bad. Control over many of the outlying districts was lost, and the elements of disorder on the British frontier were a standing menace to the peace of the country. The Burmese court, in contravention of the express terms of the treaty of 1869, created monopolies to the detriment of the trade both of England and Burma; and while the Indian Government was unrepresented at Mandalay, representatives of Italy and France were welcomed, and two separate embassies were sent to Europe for the purpose of contracting new and, if possible, close alliances with sundry European powers. Matters were brought to a crisis towards the close of 1885, when the Burmese Government imposed a fine of £230,000 on the Bombay-Burma Trading Corporation, and refused to comply with a suggestion of the Indian Government that the cause of complaint should be investigated by an impartial arbitrator. An ultimatum was therefore despatched on 22nd October 1885. On 9th November a reply was received in Rangoon amounting to an unconditional refusal. The king on 7th November issued a proclamation calling upon his subjects to drive the British into the sea. On 14th November 1885 the British field force crossed the frontier, and advanced to Mandalay without incurring any serious resistance (see BURMESE WAR). It reached Ava on 26th

November, and an envoy from the king signified his submission. On 28th November the British occupied Mandalay, and next day King Thibaw was sent down the river to Rangoon, whence he was afterwards transferred to Ratnagiri on the Bombay coast. Upper Burma was formally annexed on 1st January 1886, and the work of restoring the country to order and introducing settled government commenced. This was a more serious task than the overthrow of the Burmese Government, and occupied four years. This was in part due to the character of the country, which was characterized as one vast military obstacle, and in part to the disorganization which had been steadily growing during the six years of King Thibaw's reign. By the close of 1889 all the larger bands of marauders were broken up, and since 1890 the country has enjoyed greater freedom from violent crime than the province formerly known as British Burma. The boundary with Siam was demarcated in 1893, and that with China was completed in 1900.

Burmese War of 1885.—The causes which led to this war, and the consequent annexation of Upper Burma, may be briefly narrated. Relations between the British and Burmese Governments had for some years been considerably strained, but it was not till the accession of Thibaw to the throne in 1878 that matters became really serious. This potentate opened his reign by a series of more than usually cold-blooded massacres of his nearest male relatives, and it soon became evident that the position of a British envoy at the Court of Ava was no longer either a desirable or dignified one. In 1879, therefore,

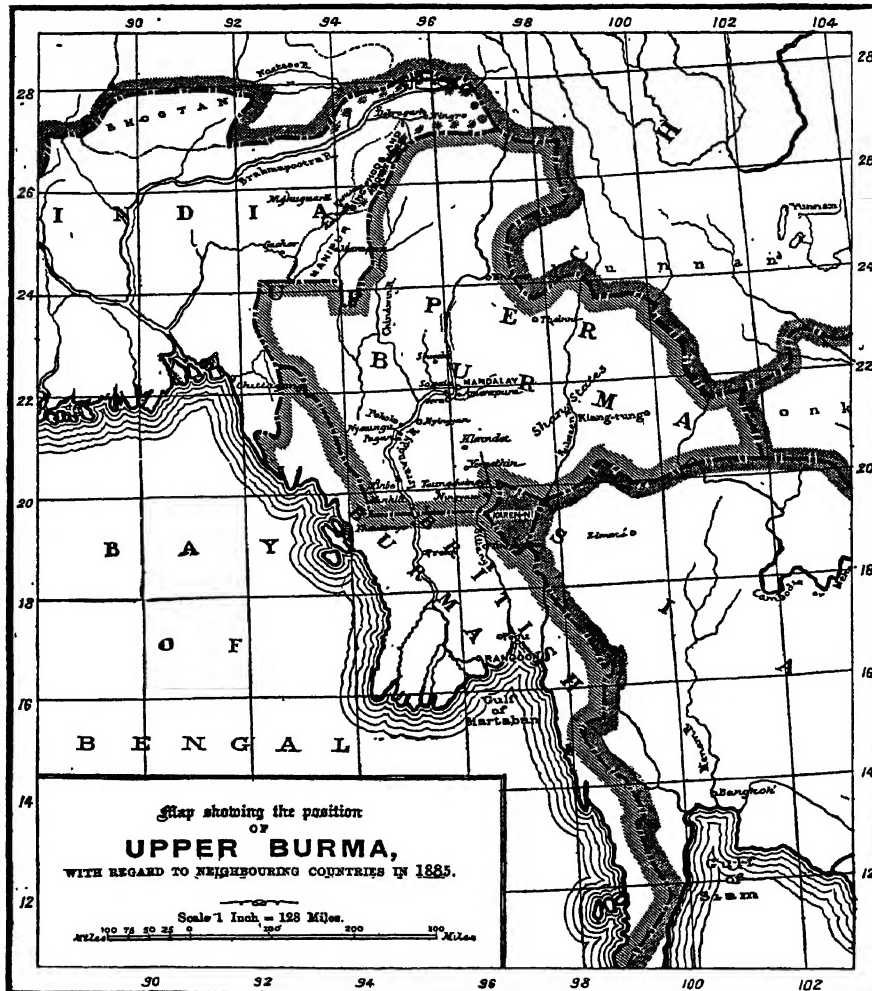

Great Britain ceased to be represented in Mandalay, and matters went from bad to worse. Thibaw lent himself more and more to foreign intrigues; and finally, in the summer of 1885, matters came to a crisis over a dispute that had arisen between the king and a large British mercantile firm, called the Bombay-Burma Trading Company, which for years had been engaged in the export of timber from the great teak forests of the king's dominions. The imposition of an impossible fine on this company, coupled with the threat of confiscation of all their rights and property in case of non-payment, led to the British ultimatum of 22nd October 1885; and by 9th November a practical refusal of the terms having been received at

Rangoon, the occupation of Mandalay and the dethronement of the king were determined upon.

At this time, beyond the fact that the country was one of dense jungle, and therefore most unfavourable for military operations, little was known of the interior of Upper Burma; but British steamers had for years been running on the great river highway of the Irrawaddy, from Rangoon to Mandalay, and it was obvious that the quickest and most satisfactory method of carrying out the British campaign was an advance by water direct on the capital. Fortunately a large number of light-draught river steamers and barges (or "flats"), belonging to the Irrawaddy Flotilla Company, were available at Rangoon, and the local knowledge of the company's officers of the difficult river navigation was at the disposal of the Government. Major-General, afterwards Sir H. N. D. Prendergast, V.C., K.C.B., R.E., was placed in command of the expedition. As was only to be expected in an enterprise of this description, the navy as well as the army was called in requisition; and as usual the services rendered by the seamen and guns were most im-

portant. It may be noticed here that strong opposition to the advance of the flotilla was expected from the forts and guns known to exist on the river banks, and some at least of the redoubts had been constructed on scientific principles under European supervision. The following is an abstract of the force detailed:—3 brigades of infantry each of 1 British and 2 native battalions; 6 batteries of artillery (1 field, 2 garrison, 3 mountain); 1 pioneer regiment (native); 6 companies of sappers and miners (native); 1 naval brigade with 26 guns from H.M. ships on the station. The bulk of the native troops were from Madras, and it will be noticed that no mounted troops were in the first instance necessary. It was, nevertheless, foreseen that mounted infantry would be valuable as soon as the river work was completed, and General Prendergast applied for permission to form a company to go with the expedition. The total effective of the force was 9034 fighting men, 2810 native followers, and 67 guns; and, for river service, 24 machine guns. The river fleet which conveyed the troops and stores was composed of a total of no less than 55 steamers, barges, launches, &c.

Thayetmyo was the British post on the river nearest to the frontier,

and here, by 14th November, five days after Thibaw's answer had been received, practically the whole expedition was assembled. On the same day General Prendergast received instructions to commence operations. There is not the slightest doubt that the Burmese king and his country were taken completely by surprise by the unexampled rapidity of the advance. There had been no time for them to collect and organize for the stubborn resistance of which the river and its defences were undoubtedly capable. They had not even been able to block the river by sinking steamers, &c., across it, for, on the very day of the receipt of orders to advance, the armed steamers, the *Irrawaddy* and *Kathleen*, engaged the nearest Burmese batteries, and brought out from under their guns the king's steamer and some barges which were lying in readiness for this very purpose. On the 16th the batteries themselves on both banks were taken by a land attack, the enemy being evidently unprepared and making no resistance. On 17th November, however, at Minhla, on the right bank of the river, the Burmans in considerable force held successively a barricade, a pagoda, and the palace and redoubt of Minhla. The attack was pressed home by a brigade of native infantry on shore, covered by a bombardment from the river, and the enemy were defeated with a loss of 170 killed and 276 prisoners, besides many more drowned in the attempt to escape by the river. The advance was continued next day and the following days, the naval brigade and heavy artillery leading and silencing in succession the enemy's river defences at Nyoungu, Pokoko, and Myingyan. On 26th November, when the flotilla was approaching the ancient capital of Ava, envoys from King Thibaw met General Prendergast with offers of surrender; and on the 27th, when the ships were lying off that city and ready to commence hostilities, the order of the king to his troops to lay down their arms was received. There were three strong forts here, full at that moment of thousands of armed Burmans, and though a large number of these filed past and laid down their arms by the king's command, still many more were allowed to disperse with their weapons; and these, in the time that followed, broke up into "dacoit" or guerilla bands, which became the scourge of the country and prolonged the war for years. Meanwhile, however, the surrender of the king of Burma was complete; and on 28th November, in less than a fortnight from the declaration of war, Mandalay had fallen, and the king himself was a prisoner, while every strong fort and town on the river, and all the king's ordnance (1861 pieces), and thousands of rifles, muskets, and arms had been taken. Much valuable and curious "loot" and property was found in the palace and city of Mandalay, which, when sold, realized about 9 lakhs of rupees (£60,000). A grant of money was divided among the troops as "prize money."

From Mandalay, General Prendergast made a bold stroke and seized Bhamo on 28th December. This was a very important move, as it forestalled the Chinese, who were preparing to claim the place. But unfortunately, although the king was dethroned and deported, and the capital and the whole of the river in the hands of the British, the bands of armed soldiery, unaccustomed to conditions other than those of anarchy, rapine, and murder, took advantage of the impenetrable cover of their jungles to continue a desultory armed resistance. Reinforcements had to be pressed into the country, and it was in this phase of the campaign, lasting several years, that the most difficult and most arduous work fell to the lot of the troops. It was in this jungle warfare that the losses from battle, sickness, and privation steadily mounted up; and the troops, both British and native, proved once again their fortitude and courage.

Various expeditions followed one another in rapid succession, penetrating to the remotest corners of the land, and bringing peace and protection to the inhabitants, who, it must be mentioned, suffered at least as much from the "dacoits" as did the troops. The final, and now completely successful, pacification of the country was only brought about by an extensive system of small protective posts scattered all over the country, and small lightly-equipped columns moving out to disperse the enemy whenever a gathering came to a head, or a pretended prince or king appeared.

No account of the third Burmese war would be complete without a reference to the first, and perhaps for this reason most notable, land advance into the enemy's country. This was carried out in November 1885 from Tounghoo, the British frontier post in the east of the country, by a small column of all arms under Colonel W. P. Dicken, 3rd Madras Light Infantry, the first objective being Nyingan. The operations were completely successful, in spite of a good deal of scattered resistance, and the force afterwards moved forward to Yamethin and Hlaingdet. As inland operations developed, the want of mounted troops was badly felt, and several regiments of cavalry were brought over from India, while mounted infantry was raised locally. It was found that without these most useful arms it was generally impossible to follow up and punish the active enemy. (E. P.)

Burnaby, Frederick Gustavus (1842-1885), English traveller and soldier, was born on 3rd

March 1842, at Bedford, and was the son of a clergyman. Having been educated at Harrow and in Germany, he entered the Horse Guards (Blue) in 1859. During a period of peace that followed, his spirit of adventure found outlets in balloon-ascents and in travels through Spain and Russia. In the summer of 1874 he accompanied the Carlist forces as correspondent of the *Times*, but before the end of the war he was transferred to Africa to report on General (then Colonel) Gordon's expedition to the Soudan. This took Burnaby as far as Khartum. Returning to England in March 1875, he matured his plans for a journey on horseback to Khiva through Russian Asia, which had just been closed to travellers by the Government. His accomplishment of this task, in the winter of 1875-76, described in his book *A Ride to Khiva*, brought him immediate fame. His next leave of absence was spent in another adventurous journey on horseback, through Asia Minor, from Scutari to Erzerum, with the object of observing the Russian border, an account of which he afterwards published. In the Russo-Turkish war of 1877, Captain (or, as he soon became, Lieutenant-Colonel) Burnaby acted as travelling agent to the Stafford House (Red Cross) Committee, but had to return to England before the campaign was over. At this point began his active interest in politics, and in 1880 he made a vain attempt to win a seat at Birmingham in the Tory-Democrat interest. In 1882 he distinguished himself by crossing the Channel in a balloon. Having been disappointed of active service in the Egyptian campaign of 1882, he participated in the Sudan campaign of 1884 without official leave, and was wounded at El Teb. This did not deter him from a similar course when a fresh expedition started in 1885. He was given a post by Lord Wolseley, and met his death in the battle of Abu Klea (17th January).

Burne-Jones, Sir Edward Burne, BART. (1833-1898), English painter and designer, was born 28th August 1833 at Birmingham. His father was of Welsh descent, and the idealism of his nature and art has been attributed to this Celtic strain. An only son, he was educated at King Edward's School, Birmingham, and destined for the Church. He retained through life an interest in classical studies, but it was the mythology of the classics which fascinated him. He went into residence as a scholar at Exeter College, Oxford, in January 1853. On the same day William Morris entered the same college, having also the intention of taking orders. The two were thrown together, and grew close friends. Their similar tastes and enthusiasms were mutually stimulated. Burne-Jones resumed his early love of drawing and designing. With Morris he read *Modern Painters* and the *Morte d'Arthur*. He studied the Italian pictures in the University galleries, and Dürer's engravings; but his keenest enthusiasm was kindled by the sight of two works by a living man, Rossetti. One of these was a woodcut in Allingham's poems, "The Maids of Elfinmere"; the other was the water-colour, "Dante drawing an Angel," then belonging to Mr Coombe, of the Clarendon Press, and now in the University collection. Having found his true vocation, Burne-Jones, like his friend Morris, determined to relinquish his thoughts of the Church and to become an artist. Rossetti, although not yet seen by him, was his chosen master; and early in 1856 he had the happiness, in London, of meeting him. At Easter he left college without taking a degree. This was his own decision, not due (as often stated) to Rossetti's persuasion; but on settling in London, where Morris soon joined him at 17 Red Lion Square, he began to work under Rossetti's friendly instruction and encouraging guidance.

As Burne-Jones once said, he "found himself at

"THE MIRROR OF VENUS." By Sir E. BURNE-JONES.

"LOVE AMONG THE RUINS." By Sir E. BURNE-JONES.

five-and-twenty what he ought to have been at fifteen." He had had no regular training as a draughtsman, and lacked the confidence of science. But his extraordinary faculty of invention as a designer was already ripening; his mind, rich in knowledge of classical story and mediæval romance, teemed with pictorial subjects; and he set himself to complete his equipment by resolute labour, witnessed by innumerable drawings. The works of this first period are all more or less tinged by the influence of Rossetti; but they are already differentiated from the elder master's style by their more facile though less intensely felt elaboration of imaginative detail. Many are pen-and-ink drawings on vellum, exquisitely finished, of which the "Waxen Image" is one of the earliest and best examples; it is dated 1856. Although subject, medium,

SIR EDWARD BURNE-JONES.
(From a photograph by Elliott and Fry, London.)

and manner derive from Rossetti's inspiration, it is not the hand of a pupil merely, but of a potential master. This was recognized by Rossetti himself, who before long avowed that he had nothing more to teach him. Burne-Jones's first sketch in oils dates from this same year, 1856; and during 1857 he made for Bradfield College the first of what was to be an immense series of cartoons for stained glass. In 1858 he decorated a cabinet with the "Prioress's Tale" from Chaucer, his first direct illustration of the work of a poet whom he especially loved and who inspired him with endless subjects. Thus early, therefore, we see the artist busy in all the various fields in which he was to labour.

In the autumn of 1857 Burne-Jones joined in Rossetti's ill-fated scheme to decorate the walls of the Oxford Union. None of the painters had mastered the technique of fresco, and their pictures had begun to peel from the walls before they were completed. In 1859 Burne-Jones made his first journey to Italy. He visited Florence, Pisa, Siena, and other places, and appears to have found the gentle and romantic Siennese more attractive than any other school. Rossetti's influence still persisted; and its impress is visible, more strongly perhaps than ever before, in the two water-colours "Sidonia von Bork" and "Clara

von Bork," painted in 1860. These little masterpieces have a directness of execution rare with the artist. In powerful characterization, combined with a decorative motive, they rival Rossetti at his best. In June of this year Burne-Jones was married to Miss Georgiana Macdonald, and settled in Bloomsbury. Five years later he moved to Kensington Square, and shortly afterwards to the Grange, Fulham, an old house with a garden, where he resided till his death. In 1862 the artist and his wife accompanied Ruskin to Italy, visiting Milan and Venice.

In 1864 he was elected an associate of the Society of Painters in Water-colours, and exhibited, among other works, "The Merciful Knight," the first picture which fully revealed his ripened personality as an artist. The next six years saw a series of fine water-colours at the same gallery; but in 1870, owing to a misunderstanding, Burne-Jones resigned his membership of the society. He was re-elected in 1886. During the next seven years, 1870-77, only two works of the painter's were exhibited. These were two water-colours, shown at the Dudley Gallery in 1873, one of them being the beautiful "Love among the Ruins," destroyed twenty years later by a cleaner who supposed it to be an oil painting, but afterwards reproduced in oils by the painter (see Plate). This silent period was however, one of unremitting production. Hitherto Burne-Jones had worked almost entirely in water-colours. He now began a number of large pictures in oils, working at them in turn, and having always several on hand. The "Briar Rose" series, "Laus Veneris," the "Golden Stairs," the "Pygmalion" series, and "The Mirror of Venus" (see Plate), are among the works planned and completed, or carried far towards completion, during these years. At last, in May 1877, the day of recognition came, with the opening of the first exhibition of the Grosvenor Gallery, when the "Days of Creation," the "Beguiling of Merlin," and the "Mirror of Venus" were all shown. Burne-Jones followed up the signal success of these pictures with "Laus Veneris," the "Chant d'Amour," "Pan and Psyche," and other works, exhibited in 1878. Most of these pictures are painted in gay and brilliant colours. A change is noticeable next year, 1879, in the "Annunciation" and in the four pictures called "Pygmalion and the Image"; the former of these, one of the simplest and most perfect of the artist's works, is subdued and sober; in the latter a scheme of soft and delicate tints was attempted, not with entire success. A similar temperance of colour marks the "Golden Stairs," first exhibited in 1880. In 1884, following the almost sombre "Wheel of Fortune" of the preceding year, appeared "King Cophetua and the Beggar Maid," in which Burne-Jones once more indulged his love of gorgeous colour, refined by the period of self-restraint. This masterpiece is now in the National collection. He next turned to two important sets of pictures, "The Briar Rose" and "The Story of Perseus," though these were not completed for some years to come. In 1886, having been elected A.R.A. the previous year, he exhibited for the only time at the Royal Academy "The Depths of the Sea," a mermaid carrying down with her a youth whom she has unconsciously drowned in the impetuosity of her love. This picture adds to the habitual haunting charm a tragic irony of conception, and a felicity of execution which give it a place apart among Burne-Jones's works. He resigned his Associateship in 1893. One of the "Perseus" series was exhibited in 1887, two more in 1888, with "The Brazen Tower," inspired by the same legend. In 1890 the four pictures of "The Briar Rose" were exhibited by themselves, and won the widest admiration. The huge tempera picture, "The Star of Bethlehem," painted for the corporation of Birmingham, was exhibited in 1891. A long illness for

some time checked the painter's activity, which, when resumed, was much occupied with decorative schemes. An exhibition of his work was held at the New Gallery in the winter of 1892-93. To this period belong several of his comparatively few portraits. In 1894 Burne-Jones was made a baronet. Ill-health again interrupted the progress of his works, chief among which was the vast "Arthur in Avalon." In 1898 he had an attack of influenza, and had apparently recovered, when he was again taken suddenly ill, and died on 17th June. In the following winter a second exhibition of his works was held at the New Gallery, and an exhibition of his drawings (including some of the charmingly humorous sketches made for children) at the Burlington Fine Arts Club.

Burne-Jones's influence has been exercised far less in painting than in the wide field of decorative design. Here it has been enormous. His first designs for stained glass, 1857-61, were made for Messrs Powell, but after 1861 he worked exclusively for Morris and Co. Windows executed from his cartoons are to be found all over England; others exist in churches abroad. For the American Church in Rome he designed a number of mosaics. Reliefs in metal, tiles, gesso-work, decorations for pianos and organs, and cartoons for tapestry represent his manifold activity. In all works, however, which were only designed and not carried out by him, a decided loss of delicacy is to be noted. The colouring of the tapestries (of which the "Adoration of the Magi" at Exeter College is the best known) is more brilliant than successful. The range and fertility of Burne-Jones as a decorative inventor can be perhaps most conveniently studied in the sketch-book, 1885-95, which he bequeathed to the British Museum. The artist's influence on book-illustration must also be recorded. In early years he made a few drawings on wood for Dalziel's Bible and for *Good Words*; but his later work for the Kelmescott Press, founded by Morris in 1891, is that by which he is best remembered. Besides several illustrations to other Kelmescott books, he made eighty-seven designs for the *Chaucer* of 1897.

Burne-Jones's aim in art is best given in some of his own words, written to a friend: "I mean by a picture a beautiful, romantic dream of something that never was, never will be—in a light better than any light that ever shone—in a land no one can define or remember, only desire—and the forms divinely beautiful—and then I wake up, with the waking of Brynhild." No artist was ever more true to his aim. Ideals resolutely pursued are apt to provoke the resentment of the world, and Burne-Jones encountered, endured, and conquered an extraordinary amount of angry criticism. In so far as this was directed against the lack of realism in his pictures, it was beside the point. The earth, the sky, the rocks, the trees, the men and women of Burne-Jones are not those of this world; but they are themselves a world, consistent with itself, and having therefore its own reality. Charged with the beauty and with the strangeness of dreams, it has nothing of a dream's incoherence. Yet it is a dreamer always whose nature penetrates these works, a nature out of sympathy with struggle and strenuous action. Burne-Jones's men and women are dreamers too. It was this which, more than anything else, estranged him from the age into which he was born. But he had an inbred "revolt from fact" which would have estranged him from the actualities of any age. That criticism seems to be more justified which has found in him a lack of such victorious energy and mastery over his materials as would have enabled him to carry out his conceptions in their original intensity. Representing the same kind of tendency as distinguished his French contemporary, Puvis de Chavannes, he was far less in the main current of art, and his position suffers accordingly. Often compared with Botticelli, he had nothing of the fire and vehemence of the Florentine. Yet, if aloof from strenuous action, Burne-Jones was singularly strenuous in production. His industry was inexhaustible, and needed to be, if it was to keep pace with the constant pressure of his ideas. Invention, a very rare excellence, was his pre-eminent gift. Whatever faults his paintings may have, they have always the fundamental virtue of design; they are always pictures. His fame might rest on his purely decorative work. But his designs were informed with a mind of romantic temper, apt in the discovery of beautiful subjects, and impassioned with a delight in pure and variegated colour. These splendid gifts were directed in a critical and fortunate moment by the genius of Rossetti. Hence a career which shows little waste or misdirection of power, and, granted the aim proposed, a rare level of real success.

Burnley, a poor-law township, municipal, county (1888), and parliamentary borough, and market town of Lancashire, England, on the Brun, where it is joined by the Calder, 213 miles N.W. of London by rail. In 1889 the boundaries of the borough were extended, and the borough was then distributed into 12 wards, all which in 1894 were united into one civil parish. The corporation consists of a mayor, 12 aldermen, and 36 councillors. By Act of Parliament 1890, the future rector of Burnley will be suffragan bishop of the diocese of Manchester, with the title of Bishop of Burnley. The Mechanics' Institution and School of Science (1852) was enlarged in 1888. Modern erections are 10 Established, 2 Roman Catholic, and numerous Nonconformist churches, a handsome town hall, a municipal technical school, a Victoria Hospital and infirmary (£28,000), a sanatorium for infectious diseases, a market hall, public abattoirs and cold stores, and baths. The Queen's Park (1893) measures 28, and the Scott Park (1895) 18 acres. There are, besides, 11 recreation grounds. The neighbourhood abounds in coal, and coal-mining constitutes one of the industries of Burnley. The principal industries are cotton-weaving, iron-founding, coal-mining, brick-burning, and the making of sanitary wares. The census of 1891 gives 12,240 males and 15,211 females engaged in the manufacture of cotton goods; 2087 persons engaged in coal-mining. Area of municipal and county borough, 4015 acres; population (1881), 63,339; (1891), 87,016; (1901), 97,044.

Burnside, Ambrose Everett (1824-1881), American soldier, was born at Liberty, Indiana, on 23rd May 1824, of Scottish pedigree, his American ancestors settling first in South Carolina, and next in the north-west wilderness, where his parents, who were very poor, lived in a rude log cabin. He was appointed to the United States military academy through casual favour, and graduated in 1847, when war with Mexico was nearly over. In 1852 he resigned his commission, and took up in Rhode Island the manufacture of a breech-loading rifle of his own invention. Afterwards he was engaged in railway duties. When the Civil War broke out he took command of a Rhode Island regiment of three months' militia, on the summons of Governor Sprague, hastened to the relief of the national capital, and commanded a brigade in the battle of Bull Run. On 6th August 1861 he was commissioned a brigadier-general of volunteers, and placed in charge of the expeditionary force which sailed on 12th January 1862 under sealed orders for the North Carolina coast. The victories of Hatteras Inlet, Roanoke Island, Newbern, and the neighbouring forts (February-March) furnished one of the earliest substantial achievements of the Union arms during the war. Promoted major-general on 18th May 1862, he was transferred with his corps to the army of the Potomac, and fought at South Mountain and Antietam in September. His patriotic spirit, with modest and amiable manners, made him highly popular, and upon McClellan's final displacement from the army of the Potomac, President Lincoln chose him as successor. Burnside reluctantly accepted the trust, and, after being disastrously defeated in the assault of Fredericksburg on 13th December 1862, was led to resign the command in January 1863. Transferred to Cincinnati in April 1863, he caused the arrest and court-martial of Mr Vallandigham, lately an Opposition member of Congress, for an alleged disloyal speech; then starting southwards in August with a column for the relief of loyalists in East Tennessee, he entered Knoxville, to which the Confederate general Longstreet unsuccessfully laid

siege. In April 1864 Burnside returned to the east, and was attached once more to the army of the Potomac in a subordinate command; but, after long and bloody campaigns, he was blamed for the failure of a mine assault before Petersburg, July 1864, and relieved. Resigning from the army, April 1865, he was chosen governor of Rhode Island in 1866, and twice annually re-elected. In January 1875 he was chosen to the United States Senate, and re-elected in 1880. He died at Bristol, Rhode Island, on 13th September 1881.

Burntisland, a royal, parliamentary (Kirkcaldy group), and police burgh of Fifeshire, Scotland, on the northern shore of the Firth of Forth, $5\frac{1}{4}$ miles S.W. of Kirkcaldy by rail. Since the opening of the Forth Bridge, Burntisland has ceased to be the terminus of the railway ferry traffic with the south, but having good wet docks it has still a considerable shipping trade. Population of parliamentary and police burgh (1881), 4099; of the royal burgh, 3197; of the royal, parliamentary, and police burgh (1891), 4962; (1900), 5000.

Burriana, a town of Spain, province of Castellon, on the river Bechi, near the sea, in a broad fertile plain. Population, 12,154. The river Mijares is used to irrigate the country, where wine, cereals, fruit, and especially oranges, are abundant. The port is annually visited by about 300 vessels, engaged in the coasting trade. The trade, however, declined in 1898 and 1897, owing to the damage done to the orange crop by a new insect pest. Burriana was the scene of hard fighting in the earliest wars of the 19th century.

Burrillville, a town of Providence county, Rhode Island, U.S.A. It is one of the largest towns of New England, having an area of 53 square miles. Its surface is rolling, with many small hills and ponds, and, while most of its population is rural, it contains several small villages. Population (1890), 5492; (1900), 6317.

Burroughs, John (1837—), American writer on nature and natural history, was born in Roxbury, Delaware county, New York, 3rd April 1837. In his earlier years he engaged in various pursuits—teaching, journalism, banking, farming, and fruit-raising, and for nine years was a clerk in the Treasury department at Washington. After publishing a monograph on the poetry and personality of Walt Whitman, he began in 1871, with *Wake-Robin*, that series of books on birds, flowers, and rural scenes which has made him the successor of Thoreau as a popular essayist on the plants and animals environing human life. His later writings have shown a more philosophic mood and a greater disposition towards literary or meditative allusion than their predecessors, but the general theme and method have been the same. His chief books, in addition to *Wake-Robin*, are *Birds and Poets* (1877), and *Signs and Seasons* (1886). *Winter Sunshine* (1875), and *Fresh Fields* (1884) are sketches of travel in England, Ireland, and France. A complete uniform edition of his works was issued in 1895 in ten volumes.

Burslem, a municipal borough (1878) and market town of Staffordshire, England, 20 miles N. by W. of Stafford, by rail, on the Grand Trunk Canal. Before 1885 part of the parliamentary borough of Stoke-upon-Trent, it now forms part of that of Hanley. Modern structures are two church mission rooms, two Methodist chapels, a market building, a charity hospital, a miners' hall, and public baths. The Wedgwood Memorial Institute has been extended and a public park of 22 acres opened (1894). Population (1881), 27,551; (1891), 31,999; (1901), 38,766.

Burton, Sir Frederick William (1816-1900), British painter and art connoisseur, the third son of Mr Samuel Burton of Mungret, county Limerick, was born in Ireland in 1816. He was educated in Dublin, where his artistic studies were carried on with marked success under the direction of Mr Brocas, an able teacher, who foretold for the lad a distinguished career. That this estimate was not exaggerated was proved by Burton's immediate success in his profession. He was elected an associate of the Royal Hibernian Academy at the age of twenty-one and an academician two years later; and in 1842 he began to exhibit at the Royal Academy. A visit to Germany and Bavaria in 1851 was the first of a long series of wanderings in various parts of Europe, which gave him a profound and intimate knowledge of the works of the Old Masters, and prepared him admirably for the duties that he undertook in 1874 when he was appointed director of the British National Gallery in succession to Sir W. Boxall, R.A. During the twenty years that he held this post he was responsible for many important purchases, among them Leonardo da Vinci's "Virgin of the Rocks," Raphael's "Ansidei Madonna," Holbein's "Ambassadors," Van Dyck's equestrian portrait of Charles I, and the "Admiral Pulido Pareja," by Velasquez; and he added largely to the noted series of Early Italian pictures in the gallery. The number of acquisitions made to the collection during his period of office amounts to not fewer than 500. His own work, most of which was in water-colour, may be said to have had more attraction for experts than for the general public. It was always serious and deeply considered, and in style was akin to that of the Pre-Raphaelites. He was elected an associate of the Royal Society of Painters in Water-Colours in 1855, and a full member in the following year. He resigned in 1870, and was re-elected as an honorary member in 1886. A knighthood was conferred on him in 1884, and the degree of LL.D. of Dublin in 1889. In his youth he had strong sympathy with the "Young Ireland Party," and was a close associate with some of its members. He died at his house in Kensington on 16th March 1900. (A. L. B.)

Burton, John Hill (1809-1881), Scottish historical writer and man of letters, was the son of an officer in the army, and was born at Aberdeen on 22nd August 1809. After studying at the university of his native city, he removed to Edinburgh to practise as an advocate; but his progress was slow, and he eked out his narrow means by miscellaneous literary work, much of which cannot now be identified. His *Manual of the Law of Scotland* (1839) brought him into notice; he joined Bowring in editing the works of Jeremy Bentham, and for a short time was editor of the *Scotsman*, which he committed to the cause of free trade. In 1846 he achieved high reputation by his *Life of David Hume*, based upon extensive and unused MS. material. In 1847 he wrote his biographies of Lord Lovat and Duncan Forbes, and in 1849 prepared for Chambers's Series manuals of political and of social economy, and of emigration. In the same year he lost his wife, and never again mixed freely with society, though after some years he married again. He devoted himself mainly to literature, contributing largely to the *Scotsman* and *Blackwood*, writing *Narratives from Criminal Trials in Scotland* (1852), *Treatise on the Law of Bankruptcy in Scotland* (1853), and publishing in the latter year the first volume of his *History of Scotland*, which was completed in 1870. Some of the more important of his contributions to *Blackwood* were embodied in two delightful volumes, *The Book Hunter* (1860) and *The Scot Abroad* (1862). He had in 1854 been appointed secretary to the Prison Board, S. II. — 61

an office which gave him entire pecuniary independence, and the duties of which he discharged most assiduously, notwithstanding his literary pursuits and the pressure of another important task assigned to him after the completion of his history, the editorship of the *National Scottish Registers*. Two volumes were published under his supervision. His last work, *The History of the Reign of Queen Anne* (1880), is very inferior to his *History of Scotland*. He died on 10th August 1881. Burton was pre-eminently a jurist and economist, and may be said to have been guided by accident into the path which led him to celebrity. It was his great good fortune to find abundant unused material for his *Life of Hume*, and to be the first to introduce the principles of historical research into the history of Scotland. All previous attempts had been far below the modern standard in these particulars, and Burton's history will always be memorable as marking an epoch, even if it should one day be superseded by a more picturesque and more animated narrative. His chief defects as a historian are want of imagination, involving feebleness of historical portraiture, and an undignified familiarity of style, which, however, at least preserves his history from the dullness by which lack of imagination is usually accompanied. His dryness is associated with a fund of dry humour exceedingly effective in its proper place, as in *The Book Hunter*. As a man he was loyal, affectionate, philanthropic, and entirely estimable. (R. G.)

Burton, Sir Richard Francis (1821-1890), British consul, explorer, and orientalist, was born at Barham House, Herts, England, on 19th March 1821. He came of the Westmoreland Burtons of Shap, but his grandfather, the Rev. Edward Burton, settled in Ireland as rector of Tuam, and his father, Lieutenant-Colonel Joseph Netterville Burton, of the 36th Regiment, was an Irishman by birth and character. His mother was descended from the MacGregors, and he was proud of a remote drop of Bourbon blood piously believed to be derived from a morganatic union of the Grand Monarque. There were even those, including some of the Romany themselves, who saw gipsy written in his peculiar eyes as in his character, wild and resentful, essentially vagabond, intolerant of convention and restraint. His irregular education strengthened the inherited bias. A childhood spent in France and Italy, under scarcely any control, fostered the love of untrammelled wandering and a marvellous fluency in Continental vernaculars. Such an education so little prepared him for academic proprieties, that when he entered Trinity College, Oxford, in October 1840, a criticism of his military moustache by a fellow-undergraduate was resented by a challenge to a duel, and Burton in various ways distinguished himself by such eccentric behaviour that rustication inevitably ensued. Nor was he much more in his element as a subaltern in the 18th Regiment of Bombay Native Infantry, which he joined at Baroda in October 1842. Discipline of any sort he abhorred, and the one recommendation of the East India Company's service in his eyes was that it offered opportunities for studying Oriental life and languages. He had begun Arabic without a master at Oxford, and worked in London at Hindustani under Forbes before he went out; in India he laboured indefatigably at the vernaculars, and his reward was an astonishingly rapid proficiency in Gujarati, Marathi, Hindustani, as well as Persian and Arabic. His appointment as an assistant in the Sind survey enabled him to mix with the people, and he frequently passed as a native in the bazaars and deceived his own *munshi*, to say nothing of his colonel and messmates. His wanderings in Sind were the apprenticeship for the pilgrimage to Mecca, and his seven years in India laid the foundations of his un-

paralleled familiarity with Eastern life and customs, especially among the lower classes. Besides Government reports and contributions to the Asiatic Society, his Indian period produced four books, published after his return home: *Scinde, or the Unhappy Valley* (1851), *Sindh and the Races that Inhabit the Valley of the Indus* (1851), *Goa and the Blue Mountains* (1851), and *Falconry in the Valley of the Indus* (1852). None of these achieved popularity, but the account of Sind is remarkably vivid and faithful.

The pilgrimage to Mecca in 1853 made Burton famous. He had planned it whilst mixing disguised among the Muslims of Sind, and had laboriously prepared for the ordeal by study and practice. No doubt the primary motive was the love of adventure, which was his strongest passion; but along with the wanderer's restlessness marched the zest of exploration, and whilst wandering was in any case a necessity of his existence, he preferred to roam in untrodden ways where mere adventure might be dignified by geographical service. There was a "huge white blot" on the maps of Central Arabia where no European had ever been, and Burton's scheme, approved by the Royal Geographical Society, was to extend his pilgrimage to this "empty abode," and remove a discreditable blank from the map. War among the tribes curtailed the design, and his journey went no farther than Medina and Mecca. The exploit of accompanying the Muslim Hajj to the holy cities was not unique, nor so dangerous as has been imagined. Several Europeans have accomplished it before and since Burton's visit without serious mishap. Passing himself off as an Indian Pathan covered any peculiarities or defects of speech. The pilgrimage, however, demands an intimate proficiency in a complicated ritual, and a familiarity with the minutiae of Eastern manners and etiquette; and in the case of a stumble, presence of mind and cool courage may be called into request. There are legends that Burton had to defend his life by taking others'; but he carried no arms, and confessed, rather shamefastly, that he had never killed anybody at any time. The actual journey was less remarkable than the book in which it was recorded, *The Pilgrimage to Al-Medinah and Meccah* (1855). Its vivid descriptions, pungent style, and intensely personal "note" distinguish it from books of its class; its insight into Semitic modes of thought and its picture of Arab manners give it the value of an historical document; its grim humour, keen observation, and reckless insobriety of opinion, expressed in peculiar, uncouth, but vigorous language, make it a curiosity of literature.

Burton's next journey was more hazardous than the pilgrimage, but created no parallel sensation. In 1854 the Indian Government accepted his proposal to explore the interior of the Somali country, which formed a subject of official anxiety in its relation to the Red Sea trade. He was assisted by Lieutenant Speke and two other young officers, but accomplished the most difficult part of the enterprise alone. This was the journey to Harar, the Somali capital, which no white man had entered. Burton vanished into the desert, and was not heard of for four months. When he reappeared he had not only been to Harar, but had talked with the king, stayed ten days there in deadly peril, and ridden back across the desert, almost without food and water, running the gauntlet of the Somali spears all the way. Undeterred by this experience he set out again, but was checked by a skirmish with the tribes, in which one of his young officers was killed, Captain Speke was wounded in eleven places, and Burton himself had a javelin thrust through his jaws. His *First Footsteps in East Africa* (1856), describing these adventures, is one of his most exciting and most

characteristic books, full of learning, observation, and humour.

After serving on the staff of Beatson's Bashibazouks at the Dardanelles, but never getting to the front in the Crimea, Burton returned to Africa in 1856. The Foreign Office, moved by the Royal Geographical Society, commissioned him to search for the sources of the Nile, and, again accompanied by Speke, he explored the lake regions of equatorial Africa. They discovered Lake Tanganyika in February 1858, and Speke, pushing on during Burton's illness and acting on indications supplied by him, lighted upon Victoria Nyanza. The separate discovery led to a bitter dispute, but Burton's expedition, with its discovery of the two lakes, was the incentive to the later explorations of Speke and Grant, Baker, Livingstone, and Stanley; and his report in volume xxxiii. of the *Proceedings of the Royal Geographical Society*, and his *Lake Regions of Equatorial Africa* (1860), are the true parents of the multitudinous literature of "darkest Africa." Burton was the first Englishman to enter Mecca, the first to explore Somaliland, the first to discover the great lakes that feed the Nile. His East African pioneering coincides with areas which have since become peculiarly interesting to the British Empire; and three years later he was exploring on the opposite side of Africa, at Dahomey, Benin, and the Gold Coast, regions which have also entered among the imperial "questions" of the day. Before middle age Burton had compressed into his life, as Lord Derby said, "more of study, more of hardship, and more of successful enterprise and adventure, than would have sufficed to fill up the existence of half a dozen ordinary men."

Since 1849 his connexion with the Indian army had been practically severed; in 1861 he definitely entered the service of the Foreign Office as consul at Fernando Po, whence he was shifted successively to Santos in Brazil (1865), Damascus (1869), and Trieste (1871), holding the last post till his death on 20th October 1890. Each of these posts produced its corresponding books: Fernando Po led to the publishing of *Wanderings in West Africa* (1863), *Abeokuta and the Cameroons* (1863), *A Mission to Gelele, king of Dahomé* (1864), and *Wit and Wisdom from West Africa* (1864). The *Highlands of the Brazil* (1869) was the result of four years' residence and travelling; and *Letters from the Battlefields of Paraguay* (1870) relate to a journey across South America to Peru. Damascus suggested *Unexplored Syria* (1872), and might have led to much better work, since no consulate in either hemisphere was more congenial to Burton's taste and linguistic studies; but he mismanaged his opportunities, got into trouble with the Foreign Office, and was removed to Trieste, where his Oriental prepossessions and prejudices could do no harm, but where, unfortunately, his Oriental learning was thrown away. He did not, however, abandon his Eastern studies or his Eastern travels. Various fresh journeys or revisitings of familiar scenes are recorded in his later books, such as *Zanzibar* (1872), *Ultima Thule* (1875), *Etruscan Bologna* (1876), *Sind Revisited* (1877), *The Land of Midian* (1879), and *To the Gold Coast for Gold* (1883). None of these had more than a passing interest. Burton had not the charm of style or imagination which gives immortality to a book of travel. He wrote too fast, and took too little pains about the form. His blunt, disconnected sentences and ill-constructed chapters were full of information and learning, and contained not a few thrusts for the benefit of Government or other people, but they were not "readable." There was something ponderous about his very humour, and his criticism was personal and savage. By far the most celebrated of all his books is the translation of the "Arabian Nights" (*The Thousand Nights and a Night*, 16 vols.,

privately printed, 1885-88), which occupied the greater part of his leisure at Trieste. As a monument of his Arabic learning and his encyclopædic knowledge of Eastern life this translation was his greatest achievement. It is open to criticism in many ways; it is not so exact in scholarship, nor so faithful to its avowed text, as might be expected from his reputation; but it reveals a profound acquaintance with the vocabulary and customs of the Muslims, with their classical idiom as well as their vulgar "Billingsgate," with their philosophy and modes of thought as well as their most secret and most disgusting habits. Burton's "anthropological notes," embracing a wide field of pornography, apart from questions of taste, abound in valuable observations based upon long study of the manners and the writings of the Arabs. The translation itself is often marked by extraordinary resource and felicity in the exact reproduction of the sense of the original; Burton's vocabulary was marvellously extensive, and he had a genius for hitting upon the right word; but his fancy for archaic words and phrases, his habit of coining words, and the harsh and rugged style he affected, detract from the literary quality of the work without in any degree enhancing its fidelity. With grave defects, but sometimes brilliant merits, the translation holds a mirror to its author. He was, as has been well said, an Elizabethan born out of time; in the days of Drake his very faults might have counted to his credit. Of his other works, *Vikram and the Vampire*, *Hindu Tales* (1870), a translation of *The Lusiads of Camoens* (1880), and a history of his favourite arm, *The Book of the Sword* (vol. i. 1884, unfinished), may be mentioned. A manuscript translation of the "Scented Garden," from the Arabic, was burnt by his widow, acting in what she believed to be the interests of her husband's reputation. Burton married Isabel Arundell in 1861, and owed much to her courage, sympathy, and passionate devotion. Her romantic and exaggerated biography of her husband, with all its faults, is one of the most pathetic monuments which the unselfish love of a woman has ever raised to the memory of her hero. Another monument is the Arab tent of stone and marble which she built for his tomb at Mortlake.

Besides Lady BURTON's *Life of Sir Richard F. Burton*, 2 vols., 1893, 2nd edition, condensed, edited, with a preface, by W. H. Wilkins, 1898, there are *A Sketch of the Career of R. F. Burton*, by A. B. RICHARDS, ANDREW WILSON, and ST CLAIR BADDELEY (1886); *The True Life of Captain Sir Richard F. Burton*, by his niece, G. M. STISTED (1896); and a brief sketch by the present writer prefixed to Bohn's edition of the *Pilgrimage to Al-Medīnah and Meccah* (1898), from which some sentences have here been by permission reproduced. (S. L.-P.)

Burton-upon-Trent, a municipal (1878) and county borough (1901) in the Burton parliamentary division of Staffordshire, and the Southern parliamentary division of Derbyshire, England, on the Midland, London and North-Western, North Staffordshire, and Great Northern railways. Recent structures are two Established churches, new buildings for the Roman Catholic church, Wesleyan and Baptist chapels, a bridge over the Trent, constructed at Lord Burton's expense, and a market hall. The municipal buildings have been presented by Lord Burton to the corporation, which has purchased the ferry rights over the Trent. There are eight recreation grounds. At Burton there are about twenty firms of brewers, representing nearly one-tenth of the brewing trade of the United Kingdom. The premises of Bass's brewery extend over 500 acres, and contain 17 miles of railway directly connected with outer railway systems. The brewery at Burton employs about 3500 men and boys. The total annual barrelage for 1901 exceeded a million and a half, of which the largest part was pale

ale. Allsopp's breweries, cooperages, maltings, &c., at Burton, cover an area of 43 acres, exclusive of land for water-beds, and they employ about 1300 hands. Area, 4025 acres. Population (1881), 39,288; (1891), 46,047; (1901), 50,386; of parliamentary division (1891), 58,640; (1901), 61,787.

Burtscheid, a town of Prussia, in the Rhine province. See AIX-LA-CHAPELLE.

Buru (Dutch; *Boeroe* or *Boeloe*), an island of the East Indian archipelago, belonging to the residency of Amboyna, between 3° 4' and 3° 50' S. lat., and 125° 58' and 127° 15' E. long. Area, 3396 square miles. The chief geological formations are crystalline slate near the north coast, and more to the south Mesozoic sandstone and chalk, deposits of rare occurrence in the archipelago. Lake Wakolo, altitude 2200 feet, is not a crater lake, but is situated at the junction of the sandstone and slate, where the water, having worn away the former, was accumulated by the latter. The lake has no affluents and only one outlet, the Wai Nibe to the north. The island is divided into two districts. Timber is the only export in addition to cajeput oil. The total population is estimated at 10,000.

Burujird, a province of Persia, bounded on the W. by Luristán, on the N. by Nehávend and Maláýir, on the E. by Irák, and on the S. by Isfahán. It is divided into the following administrative divisions, town of Burujird with villages in immediate neighbourhood; Silákhór (upper and lower); Jápálak (with Sar-lek and Burbarúd); nomad Bakhtiári. It has a population of about 250,000 or 300,000, and pays a yearly revenue of about £16,000. It is very fertile and produces much wheat, barley, and rice, also some opium. With improved means of transport, which would allow the growers to export, the produce of cereals could easily be trebled. BURÚJIRD, the capital, is situated in the fertile Silákhór plain on the river Tahfj, a tributary of the Dizful or Ab i Diz (which flows to the Persian Gulf), in 33° 55' N. lat. and 48° 55' E. long, at an elevation of 5315 feet. It is 70 miles by road from Hamadan, and 212 miles from Isfahán. It has a population of about 25,000, and manufactures various cotton stuffs (coarse prints, carpet covers) and felts (principally saucépan-shaped hats for Lurs and Bakhtiári), of which considerable quantities are exported. It has telegraph and post offices.

Bury, a civil parish, municipal (1876), county (1888), and parliamentary borough, and market town of Lancashire, England, on the Irwell, about 2 miles from its confluence with the Roach, 188 miles by rail N.N.W. of London. It is situated on the Manchester, Bury, and Bolton Canal. The corporation consists of a mayor, 10 aldermen, and 30 councillors. Modern erections include an Established church, a Roman Catholic church, the town hall, an art gallery and public library, a hospital, a technical school (£22,000), the Textile Operatives' Hall, a theatre, new markets and abattoirs. There are 5 recreation grounds, formed since 1886. Electric lighting has been introduced. In 1891 there were 3466 males and 7240 females engaged in the manufacture of cotton goods; 698 males and 131 females in calico printing, dyeing, and bleaching; 1377 males and 3 females in the iron and steel manufacture. Area of municipal and county borough, 5836 acres; population (1881), 54,717; (1891), 57,212; (1901), 58,028.

Bury St Edmunds, a municipal and parliamentary borough—coextensive and now returning one member—of Suffolk, England, 26 miles N.W. of Ipswich by rail, on the river Lark and the Great Eastern railway.

New grammar-school buildings have been erected and the Lathbury Institute has been established. The Church Schools Company has a good school here. The corporation owns the waterworks, which have recently been extended. The town is well lighted by electricity. Area, 2394 acres; population (1881), 16,111; (1901), 16,255.

Busch, Julian Hermann Moritz (1821–1900), German writer, was born in Dresden. He studied theology in Leipzig, being destined for the ministry, but from 1847 devoted himself entirely to journalism and literature. After the revolution he went to America, but soon returned to Germany, and published an account of his travels. During the next years he travelled extensively in the East, writing numerous books on Egypt, Palestine, &c. From 1856 he was employed on the *Grenzbote*, one of the most influential German periodicals, which, under the editorship of Gustav Freytag, had become the organ of the Nationalist party. In 1864 he became closely connected with the Augustenburg party in Schleswig-Holstein, but after 1866 he transferred his services to the Prussian Government, and was employed in a semi-official capacity in the newly-conquered province of Hanover. From 1870 onwards he was one of Bismarck's press agents, and was at the chancellor's side in this capacity during the whole of the campaign of 1870–71. In 1878 he published the first of his works on Bismarck—a book called *Bismarck und seine Leute*, in which, under the form of extracts from his diary, he gave an account of the chancellor's life during the war. The vividness of the descriptions and the cleverness with which the conversations were reported insured a success, and the work was translated into several languages. This was followed in 1885 by another book, *Unser Reichskanzler*, chiefly dealing with the work in the Foreign Office in Berlin. After Bismarck's death there appeared, this time in England, a work entitled, *Bismarck: some Secret Pages of his History*, in which was reprinted the whole of the earlier works, but which contains in addition a considerable amount of new matter, passages from the earlier works which had been omitted because of the attacks they contained on people in high position, records of later conversations, and some important letters and documents which had been entrusted to him by Bismarck. Many passages were of such a nature that it could not be safely published in Germany, but in 1899 a German edition appeared differing considerably from the English editions.

Buschtiehrad, a market town in Bohemia, Austria, about 10 miles N.W. of Prague, the centre of extensive coal-fields, formerly the private property of the emperor of Austria. There is also an imperial brewery, which produces about 20,000 hectolitres of beer annually, and an imperial chateau. Population (Czech) (1890), 3267; (1900), 3510.

Bush.—This term is Anglicized from the French word *bouche*, and is used in mechanics for designating the internal pipe or lining frequently used in connexion with a wheel or pulley; or it may be used with reference to a pipe inserted in a plate frame or cast bracket, in order to form a bearing for a shaft to rotate in.

Bushes are employed because it is found that frictional surfaces, if made of dissimilar metals, work together with less loss in friction and with much less risk of abrasion. Mild steel plate is now in very general use for structural purposes, and spindles and shafting used in connexion therewith are similarly made of mild steel. This material, however, abrades very readily; and it is the invariable custom with good work to bush or line the holes forming bearings with bronze or other metal than mild steel. In the case of wheels and axles, the wheels are bushed with a metal liner dissimilar to that of which the axle is made; and hard cast steel, cast iron, hard or soft bronzes, or white metal are variously used in cases where the

axle is of mild steel or wrought iron. White metal or Babbitt's metal (an alloy of tin, copper, and antimony, with a large percentage of tin) is used for bushing; it has a low melting-point, and may be cast about the shaft of which it is to form a bearing.

Bushire, or BANDER BUSHIRE, a town of Persia, on the coast of Fars, situated in 28° 59' N. lat. and 50° 49' E. long. The name should be pronounced Boosheer and not Bew-shire; modern Persians write it Búshehr, and, yet more incorrectly, Abúshehr, and translate it as "father of the city," but it is most probably a contraction of Bokhtardashir, the name given to the place by the first Sassanian monarch in the 3rd century (*vide* Noeldeke's translation of Ardasher Papakan's *Karnamek*). In a similar way Ráyardashir has become Rishire (Reesheer). In the first half of the 18th century, when Bushire was an unimportant fishing village, it was selected by Nadir Shah as the southern port and dockyard of the navy which he aspired to create in the Persian Gulf, and soon afterwards the British commercial factory of the East India Company, established at Gombrin, the modern Bander Abbási, was transferred to it. At the beginning of the 19th century it had a population of 6000 to 8000, and it is now the most important port in the Persian Gulf, with a population of about 25,000. It used to be a port of Fars, but it is now the seat of the governor of the Persian Gulf ports, who is responsible to the central Government, and has under his jurisdiction all the ports of the Gulf and the districts along the coast. The following table shows the value of the exports and imports from and to Bushire in thousands of pounds, and the shipping entered and cleared at the port in thousands of tons, as given in British consular reports:—

Year.	Exports.		Imports.		Total Tonnage.		British Tonnage.	
	Total.	British.	Total.	British.	Entered.	Cleared.	Entered.	Cleared.
1885	586	204	791	728	113	111	102	100
1890	720	298	1268	1183	114	114	109	108
1895	529	226	1017	928	189	182	173	164
1896	440	183	788	624	166	144	135	126
1897	393	173	1145	982	114	113	100	98
1898	427	188	843	632	112	97	99	85
1899	529	174	917	667	149	131	124	108

Bushmen, or BOSJESMANS.—Some of the statements made in the earlier article on these aborigines of South Africa (*Ency. Brit.* vol. iv. pp. 575-6) require to be supplemented in the light of recent research. Ethnologists no longer speak of any resemblance to the Mongolians, except perhaps in the prominence of the cheek-bones, and the yellowish or yellowish-brown colour of the skin. In all other respects the difference between the two races is fundamental, while the complexity of the physical and mental characters seems rather to point to an original connexion between the under-sized Bushmen and the distinctly dwarfish Negritoes scattered in small groups over the forest tracts of the Congo and Ogowe basins. Dr Ludwig Wolf (*Im innern Afrikas*, pp. 258-61), one of the latest and most careful observers, has little doubt that both groups are surviving fragments of a primeval pigmy Negroid stock, which is to be regarded as the true autochthonous element in equatorial and South Africa. Whatever differences are now observable may readily be explained by the different environments—hot, moist woodlands in the north; hot, dry steppe lands in the south. This generalization is supported by the now established former widespread diffusion of the Bushman race, which has been traced as far north as the Nyasa and Tanganyika basins, where the Bushman and Negrito domains must have been contiguous in prehistoric times. "It would seem," writes Sir H. H. Johnston (*British Central Africa*, p. 52), "as if the earliest known race of man inhabiting what is now British Central Africa was akin to the Bushman-Hottentot type of negro.

Rounded stones with a hole through the centre, similar to those which are used by the Bushmen in the south for weighting their digging-sticks (the *graaf stock* of the Boers), have been found at the south end of Lake Tanganyika." Nor is any difficulty presented by the character of the tufted woolly hair of the Bushmen, which has no intermediate bald spaces, as was formerly supposed, but is evenly distributed over the scalp, like that of the Negritoes, and is also invariably of the same intensely black colour. The assumed "peppercorn" type of hair growing in isolated tufts is based on a misconception; and although it has been made a racial character by Fr. Müller and some other distinguished anthropologists, more careful observation has shown that it is not found amongst any known races.

A transition between the Bushmen and the Congo Negritoes seems to be presented by the hitherto little known *Vaalpens*, who still survive in small groups about the middle Limpopo river, the Zoutpansberg, and perhaps some other districts of North Transvaal. More degraded even than the lowest of the Bushmen, the *Vaalpens* are so called by the Boers from the dusty look of their bodies, due to their habit of crawling like burrowing animals into their underground dwellings. But the true colour is a pitch black, apparently of a deeper shade than that of the Wolofs or any other negro race. In height the men average about 4 feet, *i.e.*, somewhat less than the shortest Bushmen, and a little more than the shortest Negritoes described by Wolf and Emin Pasha. Socially the *Vaalpens*, who are the "dogs," or "carriage-birds," of the surrounding Bantu peoples, occupy a lower position perhaps even than the *Fuegians*, or the extinct Tasmanians. A feeble, harmless folk, they are described as the very dregs of humanity, living in holes, caves, or rock-shelters, without clothes except the kaross, or implements of any kind beyond those procured from others in exchange for skins, ivory, or ostrich feathers. In return for menial services rendered to the Boers, they are thankful for the offal of the game or other animals they may have helped to skin. They form small family groups of thirty or forty under a chief or patriarch, whose functions are purely domestic, as must be the case where there are no arts, industries, or religion of any kind, nothing but a knowledge of fire with which to cook their meals, often consisting of the aged or infirm members of the family circle. Intercourse with the surrounding populations is carried on by signs, nobody having any knowledge of their speech, which would appear to be scarcely articulate, or at least so full of clicks as to be incapable of expression by any clear phonetic system. Hence it is impossible to say whether the *Vaalpens* possess any folklore or other oral literature analogous to that of their more advanced Bushman neighbours. Some idea of the astonishing wealth of this Bushman literature may be formed from the fact that the materials collected by Bleek, and now preserved in Sir George Grey's library at Cape Town, form eighty-four stout MS. volumes of 3600 pages. They comprise myths, fables, legends, and even poetry, with tales about the sun and moon, the stars, the crocodile, and other animals; legends of peoples who dwell in the land before the Bushmen arrived from the north; songs, charms, and even prayers, or at least incantations; histories, adventures of men and animals; tribal customs, traditions, superstitions, and genealogies. It is largely owing to this copious folklore literature, taken in connexion with their astonishing power of pictorial delineation, that the Bushmen are often regarded as a race which, owing to adverse circumstances, has fallen from a higher cultural plane, whereas the *Vaalpens* represent, on the contrary, a state of arrested development analogous to that of the Samangs and other Negritoes of the Malay Peninsula.

(A. H. K.)

Busk, George (1808-1886), British surgeon and biologist, was born at St Petersburg in 1808. He studied surgery in London, both at St Thomas's and St Bartholomew's hospitals, and was an excellent operator. He was appointed assistant-surgeon to the Greenwich Hospital in 1832, and served as naval surgeon first in the *Grampus*, and afterwards for many years in the *Dread-*

nought; but subsequently, on retiring from active work in this capacity with the highest reputation, he devoted himself to the study of biology. Sir William MacCormac, in his volume on the *Centenary of the College of Surgeons* (1900), declared that the progress of biology and anthropology in the 19th century must ever be connected to a large extent with the name of Busk. From 1856 to 1859 he was Hunterian professor of Comparative Anatomy and Physiology, and after occupying other important posts in the Royal College of Surgeons he became president in 1871. He was a fellow of all the principal scientific societies, and president of several; and he received the Royal Society's Royal medal and the Geological Society's Wollaston and Lyall medals. Among his literary contributions the most notable were his valuable papers on *Extinct Elephants in Malta*, and *Teeth of Ungulates*; and he was joint translator of Kölliker's *Manual of Histology*, and Wall's *Rudiments of Pathological Histology*. He was also first Government inspector under the Vivisection Act, and held the post till 1885, performing its duties with conspicuous tact and impartiality. He was a patient and cautious investigator, full of knowledge, and unaffectedly simple in character. He died on 12th August 1886.

Busken-Huet, Conrad (1826-1886), Dutch literary critic, was born at the Hague on the 28th December 1826. He was trained for the Church, and, after studying at Geneva and Lausanne, was appointed pastor of the Walloon Chapel in Haarlem in 1851. In 1863 conscientious scruples obliged him to resign his charge, and Busken-Huet, after attempting journalism, went out to Java in 1868 as the editor of a newspaper. Before this time, however, he had begun his career as a polemical man of letters, although it was not until 1872 that he was made famous by the first series of his *Literary Fantasies*, a title under which he gradually gathered in successive volumes all that was most durable in his work as a critic. His one novel, *Lidewijde*, was written under strong French influences. Returning from the East Indies, Busken-Huet settled for the remainder of his life in Paris, where he died in April 1886. For the last quarter of a century he had been the acknowledged dictator in all questions of Dutch literary taste. Perfectly honest, desirous to be sympathetic, widely read, and devoid of all sectarian obstinacy, Busken-Huet introduced into Holland the light and air of Europe. He made it his business to break down the narrow prejudices and the still narrower self-satisfaction of his countrymen, without endangering his influence by a mere effusion of paradox. He was a brilliant writer, who would have been admired in any language, but whose appearance in a literature so stiff and dead as that of Holland in the 'fifties was dazzling enough to produce a sort of awe and stupefaction. The post-humous correspondence of Busken-Huet has been published, and adds to our impression of the vitality and versatility of his mind. (E. G.)

Bussa. See NIGERIA.

Bute, an insular county of S.W. Scotland, situated in the Firth of Clyde, between Ayrshire on the E. and Argyllshire on the N. and W. There are seven islands—Bute, Arran, the two Cumbraes, Holy Isle, Pladda, and Inchmarnock.

Area and Population.—According to the last official estimate, the area of the county is 140,307 acres, or about 220 square miles (of the island of Arran alone, 163 square miles). The population was in 1881, 17,666; in 1891, 18,404, of whom 8211 were males and 10,193 females; in 1901 it was 18,786. Taking the land area only (139,432 acres, or 217.9 square miles), the number of persons per square mile in 1891 was 84, and the number of acres to the person 7.6. In the registration county the increase of population between

1881 and 1891 was 4.3 per cent. Between 1881 and 1891 the excess of births over deaths was 688, and the increase of the resident population 747. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimacy.
1880	353	93	471	7.0
1890	370	85	387	6.20
1899	341	105	388	5.7

The birth-rate and marriage-rate are below, and the death-rate is above, the rates for Scotland. The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	26.79	24.25	21.10	20.39	20.43
Death-rate . . .	20.08	20.43	20.17	18.57	17.95
Marriage-rate . .	5.29	4.73	4.63	4.44	5.53

The number of Gaelic-speaking persons in the county in 1891 was 3482, of whom 29 spoke Gaelic only, and there were 7 foreigners. Valuation in 1889-90, £267,821; 1899-1900, £74,489.

Administration.—The county returns a member to parliament. Rothesay (9323) is the only royal burgh, but its constituency is merged in that of the county. There are 6 civil parishes forming the Bute Combination, and the number of paupers and dependants in September 1899 was 323. Bute forms a sheriffdom with Renfrewshire, and there is a resident sheriff-substitute at Rothesay, who sits also at Millport and Brodick periodically.

Education.—Six school boards manage 20 schools, with an average attendance of 2277 in 1898-99, and there is one Roman Catholic school with an average attendance of 172. The only secondary school is Rothesay Academy. The county council subsidizes technical education in agriculture both at Glasgow and at Kilmarnock, and supports itinerant lecturers on the subject.

Agriculture.—In 1898, 18.3 per cent. of the land was under cultivation; 3806 acres were under wood in 1895. Oats are the staple corn crop, and potatoes are grown on a considerable scale. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	25,214	5794	2904	6284	10,206	26
1885	25,115	5402	2656	6651	10,357	49
1890	25,513	5406	2484	9460	5,991	134
1895	25,605	5395	2606	8662	8,763	116
1899	25,728	5223	2614	8305	9,407	96

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	1177	7652	3230	42,425	620
1885	1073	8454	3343	40,343	859
1890	1251	9347	3633	50,449	906
1895	1443	9539	3838	49,219	887
1899	1277	9751	3857	47,897	621

At the date of the last return there were 604 holdings in the county, of an average size of 42 acres; 17.05 per cent. did not exceed 5 acres, 61.76 per cent. were between 5 and 50 acres, and 21.19 above 50. There were 51 farms between 50 and 100 acres, 68 between 100 and 300, only 7 between 300 and 500, and 2 above 500. According to the census of 1891 there were 1395 men and 141 women in the county engaged in agriculture.

Industries and Trade.—Seed-growing is an extensive and growing industry, and the only other industry is fishing. The Rothesay fishery district includes all the creeks of Bute and a few in Argyll and Dumbarton, while the Cumbraes are included in the Greenock district. The following table gives particulars of the Rothesay district:—

Year.	Boats.			Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.	Value.			
1890	232	912	£4213	£6353	430	£17,288
1898	228	532	3262	3169	268	6,113
1899	226	529	3241	3102	298	8,605

The herring fishing begins in June, and white fishing is prose-

cuted at one or other of the creeks all the year round. Many of the fishermen find employment during the season on the Clyde yachts, Rothesay being one of the chief centres of this sport. An export and import trade in agricultural produce and fish and miscellaneous goods respectively is carried on between the Bute ports of Rothesay, Millport, Brodick and Lamlash, and Greenock, Gourock, Wemyss Bay and Ardrossan on the mainland, and there is regular steamer communication between these ports all the year round, the traffic reaching enormous dimensions in summer.

Butler, a borough of Pennsylvania, U.S.A., capital of Butler county, situated 31 miles N. of Pittsburgh, at an altitude of 1008 feet. It is entered by three railways—the Pennsylvania; the Pittsburgh and Western; and the Pittsburgh, Butler, and Lake Erie. It is prominent in the manufacture of glass, using natural gas for fuel. Population (1880), 3163; (1900), 10,853.

Butler, Benjamin Franklin (1818-1893), American lawyer and politician, was born in Deerfield, N.H., on 5th November 1818, and died in Washington, D.C., on 11th January 1893. He early attained distinction as a lawyer in criminal cases. At different times he was a member of each branch of the Massachusetts legislature, and in 1860 he was an unsuccessful candidate for the governorship of the state. Shortly after the beginning of the Civil War he became major-general, and was in command at Fort Monroe. When the return of some slaves that had come within his lines was demanded, he declined to comply on the ground that they were contraband of war. This was a new and important, as well as amusing, application of the term. He captured forts on the coast of North Carolina in August 1861, and, after Farragut's successful movements at New Orleans, Butler took possession of that city on 1st May 1862. In the administration of its affairs he showed much vigour and some severity. His famous order stating that women insulting Federal soldiers should be treated as women of the town, was misrepresented at the South and misunderstood abroad, and Jefferson Davis declared him an outlaw. Butler's seizure of \$800,000, which had been deposited in the office of the Dutch consul, led to his displacement. Afterwards he was in command of the department of Virginia and North Carolina, but in 1864 he was removed by General Grant. He was Representative in Congress from 1867 until 1879, except the years 1875-77. He was one of the members appointed by the House of Representatives to conduct the impeachment trial of President Johnson. In 1882 the Democrats elected him as Governor of Massachusetts. In 1884 he was an unsuccessful candidate of the Greenback and Antimonopoly parties for the Presidency.

Butt, Isaac (1813-1879), Irish lawyer and Nationalist leader, was born at Stranorlar, Donegal, in 1813, his father being the local Episcopalian rector. Having won high honours at Trinity, Dublin, he was appointed professor of political economy in 1836. In 1838 he was called to the bar, and not only soon obtained a good practice, but became known as a politician on the Protestant Conservative side, and an opponent of O'Connell. In 1844 he was made a Q.C. He figured in nearly all the important Irish law cases for many years, and was engaged in the defence of Smith O'Brien in 1848, and of the Fenians between 1865 and 1869. In 1852 he was returned to Parliament by Youghal as a Liberal-Conservative, and retained this seat till 1865; but his views gradually became more liberal, and he drifted away from his earlier

opinions. His career in Parliament was marred by his irregular habits, which resulted in pecuniary embarrassment, and between 1865 and 1870 he returned again to his work at the law courts. The result, however, of the disestablishment of the Irish Church was to drive Butt and other Irish Protestants into union with the Nationalists, who had always repudiated the English connexion; and on 19th May 1870, at a large meeting in Dublin, Butt inaugurated the Home Rule movement in a speech demanding an Irish parliament for local affairs. On this platform he was elected in 1871 for Limerick, and found himself at the head of an Irish Home Rule party of fifty-seven members. But it was an ill-assorted union, and Butt soon found that he had little or no control over his more aggressive followers. He had no liking for violent methods or for "obstruction" in Parliament; and his leadership gradually became a nullity. His false position undoubtedly assisted in breaking down his health, and he died in Dublin on 5th May 1879.

Butte, the largest city of Montana, U.S.A., and capital of Silver Bow county. It is situated in 46° 00' N. lat. and 112° 32' W. long., in the valley of Deer Lodge river, near its head, at an altitude of 5544 feet. It is entered by four railways—the Northern Pacific; the Great Northern; the Montana Central; and the Butte, Anaconda, and Pacific. It is the centre of the greatest copper-mining region on the globe; the surrounding hills are honey-combed with mines, and the city contains large smelting works. The annual output of copper from this district is usually almost one-half that of the whole United States. The assessed valuation of real and personal property in 1900, on a basis of assessment of about 60 per cent. of full value, was \$18,989,200, the tax rate \$26 per \$1000, and the net debt \$585,487. Population (1880), 3363; (1890), 10,723; (1900), 30,470, of whom 20,260 were native-born and 10,210 foreign-born.

Butterflies. See INSECTS.

Buturlinovka, or PETROVSKOYE, a village of Russia, government of Voronezh, district and 28 miles S.E. of Bobrov, on the great highway to Saratov. Its inhabitants are engaged in the leather industry, have twenty tanneries, and prepare a considerable amount of sheep-skins and boots exported to the Don and the Black Sea provinces. Population, 23,400.

Buxton, a market town and fashionable watering-place in the High Peak parliamentary division of Derbyshire, England, 36 miles N.W. by N. of Derby by rail, at an elevation of 1000 feet. Its popularity has been more than maintained, and it is calculated that the average annual number of people visiting the town to take the waters is nearly 63,000. Especially has there been, of late years, a steady increase in the number of winter visitors. In 1894 the duke of Devonshire erected a handsome pump-room at St Anne's Well, and the main baths are replete with every modern convenience. The old parish church has been restored, another enlarged, and the Devonshire Hospital extended. About 3000 poor people are now treated annually with the waters at this hospital, the dome over one of the buildings of which, it may be noted, has a circumference greater than that of any other dome in Europe. Public gardens, 23 acres in area, have been provided, with a pavilion and concert hall, a theatre, and reading- and other rooms. Electric lighting has been introduced, and there is an excellent golf-course. Buxton has become an important centre for horse-breeding, and a large horse fair is held annually. Area of urban district (constituted 1894), 1275 acres; population (1881), 6021; (1891), 7540; (1901), 10,179.

Buzeu, a town in Rumania, chief town of the district of the same name, 80 miles from Bucearest. It is the residence of an orthodox archbishop, and has a court of first instance, a seminary, and gymnasium. The cathedral was erected in 1740 by Prince Mathieu Bassaraba on the ruins of the old church built *circa* 1500 by Radu the Great. In the neighbourhood are many interesting monasteries. Population (1900), 21,561.

Byelostok (Polish, *Białystok*), a district town of West Russia, government and 57 miles by rail S.W. of Grodno, on the main line to Warsaw, at its junction with the Kieff-Graevo (Prussian frontier) line, and having a branch to Baranowiczi. Founded in 1320, it became part of Prussia after the third partition of Poland, but was annexed to Russia in 1807, after the Peace of Tilsit. Its development dates from 1845, when woollen-mills were built close by. Since that time it has grown very rapidly, its population being 13,787 in 1857, 56,629 in 1889, and 63,927 in 1897. Its sixty-eight woollen, four silk, and one felt hat factories give occupation to several thousand workers, most of whom live in its populous suburbs.

Byeltsy, a district town of Russia, government of Bessarabia, 83 miles N.W. of Kishineff, connected by rail with both Odessa and Nowoselitsy on the Austrian frontier. It is the main centre of the region for trade in cattle and horses exported from the south and south-east to Poland, Austria, Rumania, and partly Prussia. Population, 18,526.

Byrd, William (1543-1623), English musical composer (whose work has not been properly appreciated till recent years), was probably a member of one of the numerous Lincolnshire families of the name who were to be found at Lincoln, Spalding, Pinchbeck, Moulton, and Epworth in the 16th century. According to Wood, he was "bred up to musick under Thomas Tallis." He was appointed organist of Lincoln Cathedral about 1563, and on 14th September 1568 was married at St Margaret in the Close to Ellen or Julian Birley. His eldest son, Christopher, was baptized at the same church 18th November 1569. On 22nd February 1569 he was sworn in as a member of the Chapel Royal, but he does not seem to have left Lincoln immediately, for his eldest daughter, Elizabeth, was baptized there 20th January 1571-72, and on 7th December 1572 Thomas Butler was appointed master of the choristers and organist on Byrd's "nomination and commendation." In the Chapel Royal he shared with Tallis the honorary post of organist, and on 22nd January 1575 the two composers obtained a license for twenty-one years from Elizabeth to print music and music-paper, a monopoly which does not seem to have been at all remunerative. In 1575 Byrd and Tallis published a collection of Latin motets for five and six voices, printed by Thomas Vautrollier. In 1578 Byrd and his family were living at Harlington, Middlesex. As early as 1581 his name occurs among lists of recusants, and though he retained his post in the Chapel Royal he was throughout his life a Catholic. About 1579 he set a three-part song in Thomas Legge's Latin play "Ricardus Tertius." In 1588 he published *Psalmes, Sonets, and Songs of Sadnes and Pietie*, and in the same year contributed two madrigals to Nicolas Yonge's *Musica Transalpina*. In 1589 appeared *Songs of Sundrie Natures*, a second edition of which was issued in 1610. In the same year he published *Liber Primus Sacrarum Cantionum*, a second series of which was brought out in 1591. In 1590 two madrigals by Byrd were included in Thomas Watson's *First Sett of Italian Madrigalls Englished*; one of these seems to have been sung before Elizabeth on her visit to Lord Hertford

at Elvetham in 1591. In April 1592 Byrd was still living at Harlington, but about 1593 he became possessed of the remainder of a lease of Stondon Place, Essex, a farm of some 200 acres, belonging to William Shelley, who was shortly afterwards convicted of high treason. The property was sequestered, and on 15th July 1595 Byrd obtained a crown lease of it for the lives of his eldest son Christopher and his daughters Elizabeth and Rachel. On the death of Shelley his son bought back his estates (in 1604), whereupon his widow attempted to oust Byrd from Stondon Place, on the ground that it formed part of her jointure. Byrd was upheld in his possession of the property by James I. (*Calendar of State Papers, Dom. Series*, James I. add. series, vol. xxxvi.), but Mrs Shelley persevered in her suit, apparently until her death in 1609. In the following year the matter was settled for a time by Byrd's buying Stondon Place in the names of John and Thomas Petre, part of the property being charged with a payment to Byrd of £20 for his life, with remainder to his second son Thomas. Throughout this long suit Byrd, though in possession of property which had been confiscated from a recusant and actually taking part as a member of the Chapel Royal at the coronation of James I., had been excommunicated since 1598, while from 1605 until 1612, and possibly later, he was regularly presented before the archidiaconal court of Essex as a Catholic. In 1603 Easte published a work (no copies of which are known to exist) entitled *Medulla Musicke. Sucked out of the sappe of two [of] the most famous Musitians that ever were in this land, namely Master Wylliam Byrd . . . and Master Alphonso Ferabosco . . . either of whom having made 40^{the} severall waies (without contention), showing most rare and intricate skill in 2 partes in one upon the playne song Miserere*. In 1607 appeared two books of *Gradualia*, a second edition of which was issued in 1610. In the following year he published *Psalmes, Songs, and Sonnets: some solemne, others joyfull, framed to the life of the Words*. Probably in the same year was issued *Parthenia*, a collection of virginal music, in which Byrd was associated with Bull and Orlando Gibbons. The last work to which he contributed was Sir Thomas Leighton's *Teares or Lamentations of a Sorrowfull Soule* (1614). His death took place on 4th July 1623. It is recorded in the *Cheque Book* of the Chapel Royal as that of a "father of musicke." His will, dated 15th November 1622, shows that he remained a Catholic until the end of his life, and he expresses a desire that he may die at Stondon and be buried near his wife. From the same document it seems that his latter years had been embittered by a dispute with his eldest son, but that the matter was settled by an agreement with his daughter-in-law Catherine, to whom he left his property at Stondon, charged with the payment of £20 to his second son Thomas and £10 to his daughter Rachel, with remainder to his grandson Thomas and his second son of the same name. In 1635 the estate again came before the Court of Chancery, on the ground that the annuities had not been paid. The property seems about 1637 to have been let to one John Leigh, and in 1651 was held by a member of the Petre family. The committee for compounding with delinquents at that date allowed Thomas Byrd the annuity of £20 bequeathed by his father. Byrd's arms, as entered in the Visitation of Essex of 1634 *ex sigillo* were three stags' heads cabossed, a canton ermine. His children were (1) Christopher, who married Catherine, daughter of Thomas Moore of Bamborough, and had a son, Thomas, living at Stondon in 1634; (2) Thomas; (3) Elizabeth, who married successively John Jackson and — Burdett; (4) Rachel, married (1) — Hook, by whom she had two children, William and Catherine, married to

Michael Walton; in 1634 Rachel Hook had married (2) Edward Biggs; (5) Mary, married (1) Henry Hawksworth, by whom she had four sons, William, Henry, George, and John; (2) Thomas Falconbridge. Anne Byrd, who is mentioned in the proceedings *Shelley v. Byrd* (*Erchequer Decrees*, 7 James I., series ii. vol. vii. fol. 294 and 328), was probably a fourth daughter who died young.

Besides the works already mentioned Byrd was the composer of three masses, for three, four, and five voices respectively, which seem to have been published with some privacy about 1588. There exists a second edition (also undated) of the four-part mass; all three have recently appeared in modern editions, and increase Byrd's claim to rank as the greatest English composer of his age. In addition to his published works, a large amount still remains in MS., comprising nearly every kind of composition. The Fitzwilliam *Virginal Book* contains a long series of interesting pieces for the virginal, and more still remains unpublished in Lady Neville's *Virginal Book* and other contemporary collections. His industry was enormous, and though his work is unequal and the licenses he allowed can hardly be defended on strict grounds, his Latin church music and his instrumental compositions entitle him to high rank among his contemporaries. As a madrigalist he was inferior to Morley, Wilbye, and Gibbons, though even in this branch of his art he often displays great charm and individuality. (W. B. S.*)

Byron, Henry James (1834-1884), English playwright, son of Henry Byron, at one time British consul at Port-au-Prince, was born in Manchester in January 1834. He entered the Middle Temple as a student in 1858, with the intention of devoting his time to play-writing.

He soon ceased to make any pretence of legal study, and joined a provincial company as an actor. In this line he never made any real success; and, though he continued to act for years, chiefly in his own plays, he had neither originality nor charm. Meanwhile he wrote assiduously, and few men have produced so many pieces of so diverse a nature. His first successes were in burlesque; but in 1865 he joined Miss Marie Wilton (afterwards Lady Bancroft) in the management of the Prince of Wales's Theatre, near Tottenham Court Road. Here several of his pieces, comedies, and extravaganzas were produced with success; but, upon his severing the partnership two years later, and starting management on his own account in the provinces, he was financially unfortunate. The commercial success of his life was secured with "Our Boys," which was played at the Vaudeville from January 1875 till April 1879—an unprecedented "run." "The Upper Crust," another of his successes, gave a congenial opportunity to Mr J. L. Toole for one of his inimitably broad character-sketches. During the last few years of his life Byron was in frail health; he died in Clapham, 11th April 1884. H. J. Byron was the author of some of the most popular stage pieces of his day. Yet his extravaganzas have no wit but that of violence; his rhyming couplets are without polish, and decorated only by forced and often pointless puns. His sentiment had T. W. Robertson's insipidity without its freshness, and restored an element of vulgarity which his predecessor had laboured to eradicate from theatrical tradition. He could draw a "Cockney" character with some fidelity, but his *dramatis personæ* were usually mere puppets for the utterance of his jests. In his social relations Byron had many friends, among whom he was justly popular for geniality and imperturbable good temper.

Caballero, Fernán (1796-1877), the pseudonym by which the Spanish novelist Cecilia Francisca Josefa Böhl de Faber y Larrea is known. Born at Morges in Switzerland on 24th December 1796, she was the daughter of Johan Nikolas Böhl von Faber, a Hamburg merchant, who lived long in Spain, married a native of Cadiz, and is creditably known to students of Spanish literature as the editor of the *Floresta de rimas antiguas castellanas* and the *Teatro español anterior á Lope de Vega*. Educated in Hamburg, she visited Spain in 1815, and, unfortunately for herself, in 1816 married Antonio Planells y Bardaxi, an infantry captain of bad character. In the following year Planells was killed in action, and in 1822 the young widow married Francisco Ruiz del Arco, Marqués de Arco Hermoso, an officer in one of the Spanish household regiments. Upon the death of Arco Hermoso in 1835, the Marquesa found herself in straitened circumstances, and in less than two years she married Antonio Arrón de Ayala, a man considerably her junior. Arrón was appointed consul in Australia, engaged in business enterprises and made money; but unfortunate speculations drove him to commit suicide in 1854. Five years earlier the name of Fernán Caballero (taken from a village in La Mancha) became famous in Spain as the author of *La Gaviota*. The writer had already published in German an anonymous romance, *Sola* (1831), and it is alleged that the earliest draft of *La Gaviota* was written in French. This novel first appeared as the feuilleton of *El Heraldo* (1849), and was received with marked favour. Ochoa, a prominent critic of the day, ratified the popular judgment, and hopefully proclaimed the writer to be a rival of Scott. No other Spanish book of the 19th century has obtained such instant and universal recognition. It was translated into most

European languages, and, though it scarcely seems to deserve the intense enthusiasm which it excited, it is the best of its author's works, with the possible exception of *La Familia de Alvarada*. Less successful attempts are *Lady Virginia* and *Clemencia*; but the short stories entitled *Cuadros de Costumbres* are interesting in matter and form, and *Una en otra* and *Elia ó la España treinta años ha* are excellent specimens of picturesque narration. It would be difficult to maintain that Fernán Caballero was a great literary artist or even a remarkable novelist, but it is certain that she was a born teller of stories and that she has a graceful, delicate style very suitable to her purpose. She came into Spain at a most happy moment, before the new order had perceptibly disturbed the old, and she brought to bear not alone a fine natural gift of observation, but a freshness of vision, undulled by long familiarity. She combined the advantages of being both a foreigner and a native. In later publications she insisted too emphatically upon the moral lesson, and lost much of her primitive simplicity and charm; but even here we may believe her own positive statement that, though she occasionally idealized circumstances, she was conscientious in choosing for her themes subjects which had occurred in her own long and varied experience. Hence she may be regarded as a pioneer in the realistic field, and this historical fact adds to her positive importance. For many years she was the most popular of Spanish writers, and the sensation caused by her death at Seville on 7th April 1877 proved that her naïve truthfulness still attracted readers who were interested in records of national customs and manners. (J. F.-K.)

Cabatuan, a town in the east of Panay, one of S. II. — 62

the Philippine Islands, in about 11° N. and 123° E., about 10 miles from Iloilo. It has a healthful climate, and is well situated on the banks of the Tigum river, in the midst of a very fertile region, which produces large quantities of rice, as well as Indian corn, tobacco, sugar, coffee, and a great variety of fruits. The language is Visayan. Population, 18,000.

Cable, George Washington (1844—), American author, was born in New Orleans, Louisiana, on 12th October 1844. At the age of fourteen he entered a mercantile establishment as a clerk; joined the Confederate army (4th Mississippi Cavalry) at the age of nineteen; at the close of the war engaged in civil engineering, and in newspaper work in New Orleans; and first became known in literature by sketches and stories of old French-American life in that city. These were first published in *Scribner's Monthly*, and were collected in book form in 1879, under the title of *Old Creole Days*. The characteristics of the series—of which the novelette *Madame Delphine* (1881) is virtually a part—are neatness of touch, sympathetic accuracy of description of people and places, and a constant combination of gentle pathos with quiet humour. These shorter tales were followed by the novels *The Granddissimes* (1880), *Dr Sevier* (1883), and *Bonaventure* (1888), of which the first dealt with Creole life in Louisiana a hundred years ago, while the second was related to the period of the Civil War of 1861-65. *Dr Sevier*, on the whole, is to be accounted Cable's masterpiece, its character of *Narcisse* combining nearly all the qualities which have given him his place in American literature as an artist and a social chronicler. In this, as in nearly all of his stories, he makes much use of the soft French-English dialect of Louisiana. He does not confine himself to New Orleans, laying many of his scenes, as in the short story *Belles Demoiselles Plantation*, in the marshy lowlands towards the mouth of the Mississippi. Cable was the leader in the noteworthy literary movement which has influenced nearly all Southern writers since the war of 1861—a movement of which the chief importance lay in the determination to portray local scenes, characters, and historical episodes with accuracy instead of merely imaginative romanticism, and to interest readers by fidelity and sympathy of portrayal of things well known to the authors. Other writings by Cable have dealt with various problems of race and politics in the Southern States during and after the "reconstruction period" following the Civil War; while in *The Creoles of Louisiana* (1884) he presented a history of that folk from the time of its appearance as a social and military factor. His dispassionate treatment of his theme in this volume and its predecessors gave increasing offence to sensitive Creoles and their sympathizers, and in 1886 Cable removed to Northampton, Massachusetts, thenceforward engaging in magazine writing and in public readings from his works. At one time he also edited a magazine in Northampton, and afterwards conducted the monthly *Current Literature*, published in New York.

Cabrera, Ramon (1806-1877), Carlist general, was born at Tortosa, province of Tarragona, Spain, on 27th December 1806. As his family had in their gift two chaplaincies, young Cabrera was sent to the seminary of Tortosa, where he made himself conspicuous as an unruly pupil, ever mixed up in disturbances and careless in his studies. After he had taken minor orders, the bishop refused to ordain him as a priest, telling him that the Church was not his vocation, and that everything in him showed that he ought to be a soldier. Cabrera followed this advice and took part in Carlist conspiracies on the death of Ferdinand VII. The

authorities exiled him, and he absconded to Morella to join the forces of the pretender Don Carlos. In a very short time he rose by sheer daring, fanaticism, and ferocity to the front rank among the Carlist chiefs who led the bands of Don Carlos in Catalonia, Aragon, and Valencia. As a raider he was often successful, and he was many times wounded in the brilliant fights in which he again and again defeated the generals of Queen Isabella. He sullied his victories by acts of cruelty, shooting prisoners of war whose lives he had promised to spare, and not respecting the lives and property of non-combatants. The queen's generals seized his mother as a hostage, whereupon Cabrera shot several mayors and officers. General Noguera unfortunately caused the mother of Cabrera to be shot, and the Carlist leader then started upon a policy of reprisals so merciless that the people nicknamed him "The Tiger of the Maeztrazgo." It will suffice to say that he shot 1110 prisoners of war, 100 officers, and many civilians, including the wives of four leading Isabellinos, to avenge his mother. When Marshal Espartero induced the Carlists of the north-western provinces, with Maroto at their head, to submit in accordance with the Convention of Vergara, which secured the recognition of the rank and titles of 1000 Carlist officers, Cabrera held out in central Spain for nearly a year. Marshals Espartero and O'Donnell, with the bulk of the Isabellino armies, had to conduct a long and bloody campaign against Cabrera before they succeeded in driving him into French territory in July 1840. The Government of Louis Philippe kept him in a fortress for some months and then allowed him to go to England, where he quarrelled with the pretender, disapproving of his abdication in favour of the count of Montemolin. In 1848 Cabrera reappeared in the mountains of Catalonia at the head of Carlist bands. These were soon dispersed, and he again fled to France. After this last effort he did not take a very active part in the propaganda and subsequent risings of the Carlists, who, however, continued to consult him. He took offence when new men, not a few of them quondam regular officers, became the advisers and lieutenants of Don Carlos in the war which lasted more or less from 1870 to 1876. Indeed, his long residence in England, his marriage with Miss Richards, and his prolonged absence from Spain had much shaken his devotion to his old cause and belief in its success. In March 1875 Cabrera sprang upon Don Carlos a manifesto in which he called upon the adherents of the pretender to follow his own example and submit to the restored monarchy of Alphonso XII., the son of Queen Isabella, who recognized the rank of captain-general and the title of count of Morella conferred on Cabrera by the first pretender. Only a very few insignificant Carlists followed Cabrera's example, and Don Carlos issued a proclamation declaring him a traitor, and depriving him of all his honours and titles. Cabrera, who was ever afterwards regarded with contempt and execration by the Carlists, died in London on 24th May 1877. He did not receive much attention from the majority of his fellow-countrymen, who commonly said that his disloyalty to his old cause had proved more harmful to him than beneficial to the new state of things. A pension which had been granted to his widow was renounced by her in 1899 in aid of the Spanish treasury, after the loss of the colonies. (A. E. H.)

Caceres, a frontier province in the west of Spain. It is the second largest province in Spain, with an area of 8014 square miles, divided into 13 administrative districts and 222 communes. The population increased from 306,594 inhabitants in 1877 to 354,245 in 1897. The province is badly off as regards roads, but the railway from

Madrid to Portugal runs through it. The climate is temperate except in summer, when the hot east winds prevail. In the north, the centre, and south there are some mountainous districts, the remainder being undulating ground, with sparse vegetation, few forests, and in many parts lacking water. The Tagus is the principal river. Cáceres has but few industries, outside the fast-decaying silk industry at Plasencia, and the regular manufactures of leather, cork, brandy, and coarse woollen stuffs. The principal manufacture is phosphorite, most of which goes abroad. The province contains only 8 mines that are actually worked—1 antimony, 3 iron, 1 argentiferous lead, and 3 phosphorite. There has been an increasing demand from abroad for wolfram and phosphate; 4500 tons of phosphorite was extracted in 1898, the proportion produced amounting to an average of 48 per cent., and in antimony 55 per cent. As regards live stock, Cáceres ranks second only to Badajoz, containing in all 1,038,435 head: in 1897 there were 13,162 horses, 17,278 mules, 34,572 asses, 74,333 cattle, 617,458 sheep, 191,264 goats, 90,368 pigs. It is famed for its sheep and pigs, and exports wool, hams, and the red sausage called "embutidos." To the culture of wheat 227,280 acres were devoted, 112,255 to that of barley, 64,310 to rye, 89,025 to oats, 362 to maize, 22,660 to chick-peas, 28,150 to vines, 72,480 to olives.

Cáceres, the capital of the above province, had a population of 14,816 in 1877, but only 13,665 in 1897. The ancient part of the city is on a hill and surrounded with walls, and contrasts with the modern suburbs outside, which have broad streets and new buildings. The old town has some fine churches and residences of noble families, in good state of preservation. In the new part are the town hall, courts of justice, episcopal palace, schools, civil and foundling hospitals, and theatre.

Cachar, a district of British India, in the Surma Valley division of Assam. It occupies the upper basin of the Surma or Barak river, being bounded on three sides by high hills. The headquarters are at Silchar. The Cachar hills rank for some purposes as a separate district, under the name of North Cachar. The area (excluding the hills) is 2472 square miles; population (1881), 293,738; (1891), 367,542, showing an increase of 25 per cent.; average density, 149 persons per square mile. Classified according to religion, Hindus numbered 239,944; Mahomedans, 112,846; Christians, 809, of whom 273 were Europeans; hill tribes, 13,899; "others," 44. In 1901 the population of the entire district was 456,151, showing an increase of 18 per cent. The land revenue is Rs.3,80,062, the incidence of assessment being nearly R.1 per acre; the number of police is 526; the number of boys at school (1896-97) was 7436, being 24.33 per cent. of the male population of school-going age; the number of girls at school was 819, being 3 per cent.; the registered death-rate (1897) was 61 per thousand. Cachar is the most flourishing centre of tea cultivation in India. In 1897 the number of gardens was 191, with 61,190 acres under tea, employing 126,194 persons (more than one-third of the total population), of whom 5578 had been imported by contract, and yielding 22,000,000 lb, or 406 lb per acre. There are two timber-mills, producing tea-chests, &c., valued at Rs.33,000. The Assam-Bengal railway traverses the district, and is being extended through North Cachar. A branch from Badarpur to Silchar (18 miles) was opened in November 1898.

The district of NORTH CACHAR lies between the Jaintia Hills and the state of Manipur. The headquarters are at Gunjong. Area, 1728 square miles; population (1891), 20,120, mostly hill tribes; average density, 10 persons per square mile, being far the lowest in the province. The

continuation of the railway through this hilly and unhealthy tract was a work of great difficulty.

Cadenabbia, a village of the province of Como, Lombardy, Italy, on the west shore of Lake Como, nearly opposite Bellagio, a favourite spring and autumn resort, the place being situated in the loveliest part of the lake, and sheltered against the prevailing winds. Here is the Villa Carlotta (1747), which contains the "Triumph of Alexander," one of the greatest creations of Thorwaldsen.

Cadillac, capital of Wexford county, Michigan, U.S.A., situated in the north-western part of the Lower Peninsula, in a heavily forested region, on the Ann Arbor and the Grand Rapids and Indiana railways, at an altitude of 1293 feet. Population (1880), 2213; (1890), 4461; (1900), 5997.

Cadiz, a maritime province in the extreme south of Spain. The highest mountains are the Cerro de San Cristobal and Sierra del Pinar. The mountainous districts are very picturesque, well wooded, and abound in large game. There are numerous rivers—the Guadalquivir, the Guadalete, the Majaceite, the Guadiaro, the Guadarranque Gibraltar, the Salado, the Palmorus, and the Barbate. The climate is generally mild and temperate, some parts of the coast only being unhealthy owing to a marshy soil. The main line of railway from Cadiz to Madrid runs through the centre of the province, with many branches, and new lines are being pushed forward. The province is divided into 13 administrative districts and 42 communes, more than one-third of which are thriving and populous towns. The population was 430,158 in 1877 and 434,250 in 1897, on an area of 2828 square miles. The industries are insignificant compared with the importance of the natural products of the soil, especially wines and olives. But the fisheries furnish more than 5,500,000 lb of fish per annum, one-fifth part of which is salted and the rest consumed in Spain. There are 40 establishments for salting the fish and 4000 hands are thus employed. Naval yards exist at Cadiz, Puerto Real, and San Fernando, the last being a State arsenal and dockyard. A considerable amount of salt is obtained by evaporation of sea-water in pans near Cadiz, San Fernando, Puerto Real, and Santa Maria. In 1897 the live stock included 20,865 horses, 8298 mules, 10,612 asses, 71,855 cattle, 86,972 sheep, 68,398 goats, and 45,132 pigs. Wheat occupied 231,077 acres, barley 58,060 acres, rye 4275, oats 6587, maize 6005, chick-peas 32,472, vines 51,285, and olives 42,867.

Cadiz, a seaport and the capital of the above province, with a population of 65,028 in 1877 and 67,987 in 1897. The final severing of the connexion between Spain and Cuba and Porto Rico, in 1898, coming as it did after several years of colonial wars that had greatly depressed trade, was a severe blow for Cadiz as a commercial emporium. Of late years local capital and enterprise have taken the direction of industries and shipbuilding, and numerous factories with their tall chimneys have sprung up in the suburbs. A private shipbuilding yard with a capital of £400,000 was started and obtained some government contracts, though much hampered by an agreement to draw its materials from native firms in Catalonia and Biscay, in preference to foreign. The beetroot-sugar industry is progressing in the neighbourhood, as in the rest of Spain, through the operation of high import duties on foreign sugars. Tunny fish is caught in great quantities near the port—83,000 in 1898—and salted, to be sent chiefly to Italy. The cork industries exported 58,000,000 corks in 1898—14,000,000

going to England—but, owing to high export duties, only 107 tons of cork-wood. 78,228 lasts of salt, each last being $2\frac{1}{2}$ tons, were shipped for foreign countries in 1898, and 13,201 lasts for other Spanish ports. The number of British vessels that entered the port during 1898 was 291, of 180,535 tons, as against 267 vessels of 133,479 tons in 1897. 55 of the former brought 42,792 tons of British coal, and in all 202 entered with cargoes, while 89 were in ballast. 175 with cargoes and 5 in ballast cleared for Great Britain and British colonies, and 60 with cargoes and 50 in ballast for other countries. The total number of vessels of all nationalities that entered the port in 1898 was 2696 of 1,631,428 tons, of which 2050 of 1,216,026 tons were Spanish. The docks and quays, as well as the through railway communication, would require to be much improved to attract ocean-going steamers and make Cadiz a port of call, and a coaling station, especially with Gibraltar so near. The total value of the customs receipts in 1898 was £54,834, a falling-off of £27,934 on 1897 and £26,104 on 1896. Coal was one of the principal imports: 157,900 tons in 1898—94,786 from England and the rest from Spain itself. The wine trade of Jerez, Puerto Santa Maria, and Puerto Real, near Cadiz, contribute extensively to the exports of Cadiz.

Caen, chief town of Calvados, 148 miles N.W. of Paris by rail, and a fortified town of the third class. A monument of the "Sons of Calvados" commemorates those who fell in the war of 1870-71. The ancient Abbaye aux Hommes is now occupied by the Lycée. A natural history museum contains the collection of d'Urville, and an art museum has one of the richest collections of paintings in France. The number of vessels engaged in the foreign trade entered at Caen in 1899 was 644, of 205,749 tons. Iron ore has become by far the most important export. Population (1881), 34,460; (1891), 37,184; (1896), 37,457, (comm.) 39,105.

Cæsarea-Mazaca, now Kaisarieh, chief town of a sanjak in the Angora vilâyet of Asia Minor. Mazaca, the residence of the kings of Cappadocia, later called *Eusebea*, and named *Cæsarea* by Claudius, stood on a low spur on the north side of Erjish Dag (M. *Argæus*). It was taken by Tigranes, and afterwards, in A.D. 268, by Shahpûr I. (Sapor). In the 4th century Basil, when bishop, established an ecclesiastical centre on the plain, about one mile to the north-east, and this gradually supplanted the old town. A portion of Basil's new city was surrounded with strong walls, and turned into a fortress by Justinian; and within the walls, rebuilt in the 13th and 16th centuries, lies the greater part of Kaisarieh, altitude 3500 feet. The town was captured by the Seljûk sultan, Alp Arslan, 1064, and by the Mongols, 1243, before passing to the Osmanli Turks. Its early commercial importance was due to its position on the ancient trade route from Sinope to the Euphrates, on the Persian "Royal Road" from Sardis to Susa, and on the great Roman highway from Ephesus to the East. It is still the most important trade centre in eastern Asia Minor, and is remarkable for the enterprise of its merchants and traders. The town is noted for its fruit, especially its vines; and it exports tissues, carpets, hides, yellow berries, and dried fruit. Kaisarieh is the headquarters of the American Mission in Cappadocia, which has several churches and schools for boys and girls. It is the seat of a Greek bishop, an Armenian archbishop, and a Roman Catholic bishop, and there is a Jesuit school. On the 30th November 1895 there was a massacre of Armenians, in which several Gregorian priests and Protestant pastors lost their lives. Population, 50,000 (Moslems, 27,000; Christians, 23,000). (c. w. w.)

Cæsarea-Palæstina, now Kaisarieh, on the coast of Palestine. In 1884 a colony of Bosnians was settled on the site, and there has since been much destruction of the ruins.

Cagliari, a town and archiepiscopal see of Italy, capital of the province of Cagliari and of all Sardinia. It stands at the head of a fine bay at the south end of the island. The university, which has mineralogical and zoological collections, was attended by 241 students in 1898, and had 32 professors. This town is famous for its many excellent charitable organizations. There are, further, a botanical garden, a royal school of viticulture, a school of the industrial arts and sciences, and a school of navigation. The exports consist principally of metals and minerals, with timber, spirits, hides, cereals, live animals, &c., to the annual value of £533,600. The imports are of the annual value of £237,700. In addition to this there is a coasting trade of about £2,000,000 annually. The port was cleared in 1897 by 1517 vessels of 458,067 tons; all the ports of Sardinia together, by 2749 vessels of 804,400 tons in 1889. Population of province (1881), 420,635; (1901), 482,000; of town (1881), 38,598; (1901), 53,734.

Cagsaua, a town of 20,000 inhabitants, in the province of Albay, Luzon, Philippine Islands. It is $1\frac{1}{2}$ miles from the town of Albay, which is its port, and its exports are those of the latter city. The language is Bicol.

Cahors, chief town of department Lot, France, 360 miles S.S.W. of Paris, on railway from Paris to Toulouse. Its industries include shoe manufactures, dye-works, and large distilleries. Coal is worked in the neighbourhood, and amongst minor articles of commerce are nuts, oil of nuts, and prunes. It was the birthplace of Léon Gambetta, of whom there is a bronze statue by Falguière in the Boulevard Gambetta. The Lycée Gambetta is installed in old monastic buildings. There is a monument in commemoration of the war of 1870-71. The restoration of the old fortified Valentré bridge was completed in 1881. Population (1876), 11,145, comm. 12,615; (1886), 12,057; (1896), 10,882, comm. 12,331; (1901), 13,981.

Caibarien, a sugar-shipping port on the north coast of Santa Clara province, Central Cuba, 193 miles E. by S. of Havana. Population (1899), 7013.

CaIRD, John (1820-1898), Scottish divine and philosopher, was born at Greenock, 15th December 1820. After being at school until his sixteenth year he began life in his father's office, his father being partner and manager of a firm of engineers. Two years later, however, he obtained leave to continue his studies at Glasgow University. Once more, after a year of academic life, he tried business again; he acquitted himself highly creditably at first, but he finally abandoned business in 1840, and returned to college. In 1845 he entered the ministry of the Church of Scotland, holding the livings of Newton-on-Ayr, of Lady Yester's, Edinburgh, of Errol in Perthshire, and of Park Church, Glasgow, until in 1862 he accepted the chair of Divinity at Glasgow. During these years he won for himself a foremost place among the preachers of Scotland, having for his contemporaries such men of great eloquence as Norman Macleod and Guthrie. His most notable sermons were: "Religion in Common Life," "What is Religion?" "The Universal Religion." In theology he was essentially a Broad Churchman, seeking always to show forth the permanent elements in religion, and ignoring the technicalities of doctrine. In 1873 he was appointed Vice-Chancellor and Principal of Glasgow University. He delivered the Gifford Lectures in 1892-93

and in 1895-96. His *Introduction to the Philosophy of Religion*, published in 1880, is an attempt to show the essential rationality of religion. It is idealistic in character, being, in fact, a reproduction of Hegelian teaching in clear and melodious language. His line of argument for the Being of God is based, briefly, on the hypothesis that thought—not individual but universal—is the reality of all things, the existence of this Infinite Thought being demonstrated by the limitations of finite thought. Again, his Gifford Lectures are devoted to the proof of the truth of Christianity on grounds of right reason alone. Principal Caird also wrote an excellent study of Spinoza, in which he showed the latent Hegelianism of the great Jewish philosopher. He died 30th July 1898.

Cairns, Hugh M'Calmont Cairns, 1st EARL (1819-1885), Irish statesman, and Lord Chancellor of England, was born at Cultra, county Down, Ireland, 27th December 1819. One of the ablest lawyers who ever adorned the woolsack, he also played in politics a more prominent part than lawyers have usually sustained, leading the Conservative party in the House of Lords between 1869 and 1880. His father, William Cairns, formerly a captain in the 47th Regiment, came of a family of Scottish origin, which migrated to Ireland in the time of James I. Hugh Cairns was his second son, and was educated at Belfast Academy and at Trinity College, Dublin. He showed such talent that his tutor at Trinity College, the Rev. George Wheeler, persuaded his father that he should be trained for the Law instead of for the Church, for which he had been intended. Accordingly, after taking a first-class in classics, and a B.A. degree in 1838, he left Ireland for London and entered at the Middle Temple, where he was called to the bar in 1844, afterwards becoming a member of Lincoln's Inn. During his first years at the Chancery Bar, Cairns showed little promise of the eloquence which afterwards distinguished him. Never a rapid speaker, he was then so slow and diffident, that he feared that this defect might interfere with his legal career. Fortunately he was soon able to rid himself of the idea that he was only fit for practice as a conveyancer. In 1852 he entered Parliament as member for Belfast, and his Inn, on his becoming a Q.C. in 1856, made him a Benchers.

In 1858 Cairns was appointed Solicitor-General, and was knighted, and in May of that year made two of his most brilliant and best-remembered speeches in the House of Commons. In the first, he defended the action of Lord Ellenborough, who, as President of the Board of Control, had not only censured Lord Canning for a proclamation issued by him as Governor-General of India, but had made public the despatch in which the censure was conveyed. On the other occasion referred to, Sir Hugh Cairns spoke in opposition to Lord John Russell's amendment to the motion for the second reading of the Government Reform Bill, winning the most cordial commendation of Mr Disraeli. Disraeli's appreciation found an opportunity for displaying itself some years later, when in 1868 he invited him to be Lord Chancellor in the brief Conservative administration which followed Lord Derby's resignation of the leadership of his party. Meanwhile, Cairns had maintained his reputation in many other debates, both when his party was in power, and when it was in opposition. In 1866 Lord Derby, returning to office, had made him Attorney-General, and in the same year he had availed himself of the retirement of Sir J. Knight Bruce, to seek the comparative rest of the Court of Appeal. While a Lord Justice he had been offered a peerage, and though at first unable to accept it, he had finally done so on a relative, a member of the

wealthy family of M'Calmont, providing the means necessary for the endowment of a title.

The appointment of Baron Cairns of Garmoyle as Lord Chancellor involved the superseding of Lord Chelmsford, an act which apparently was carried out by Mr Disraeli with less tact than might have been expected of him. Lord Chelmsford bitterly declared that he had been sent away with less courtesy than if he had been a butler, but the testimony of Lord Malmesbury is strong that the affair was the result of an understanding arrived at when Lord Chelmsford took office. Mr Disraeli held office on this occasion for a few months only, and when Lord Derby died in 1889, Lord Cairns became the leader of the Conservative opposition in the House of Lords. He had distinguished himself in the Commons by his resistance to the Roman Catholics' Oath Bill brought in in 1865; in the Lords, his efforts on behalf of the Irish Church were equally strenuous. His speech on Mr Gladstone's Suspensory Bill was afterwards published as a pamphlet, but the attitude which he and the peers who followed him had taken up, in insisting on their amendments to the preamble of the Bill, was one difficult to maintain, and Lord Cairns made terms with Lord Granville in circumstances which precluded his consulting his party first. He issued a circular to explain his action in taking a course for which many blamed him. Viewed dispassionately, the incident appears to have exhibited his statesmanlike qualities in a marked degree, for he secured concessions which would have been irretrievably lost by continued opposition. Not long after this, Lord Cairns resigned the leadership of his party in the Upper House, but he had to resume it in 1870, and took a strong part in opposing the Irish Land Bill in that year. On the Conservatives coming into power in 1874, he again became Lord Chancellor; in 1878 he was made Viscount Garmoyle and Earl Cairns; and in 1880 his party went out of office. In opposition he did not take as prominent a part as previously, but when Lord Beaconsfield died in 1881, there were some Conservatives who considered that his title to lead the party was better than that of Lord Salisbury. His health, however, never robust, had for many years shown intermittent signs of failing. He had periodically made enforced retirements to the Riviera, and for many years had had a house at Bournemouth, and it was here that he died on 2nd April 1885.

Cairns was a great lawyer, with an immense grasp of first principles and the power to express them; his judgments taking the form of luminous expositions or treatises upon the law governing the case before him, rather than of controversial discussions of the arguments adduced by counsel, or of analysis of his own reasons. Lucidity and logic were the leading characteristics of his speeches in his professional capacity, and in the political arena. An incident of his Lord Chancellorship deserves record. In the hearing of an appeal by the House of Lords, a noble lord fresh from the Appeal Court, where interruptions of counsel are still too common, kept interposing questions during the argument. Lord Cairns turned to this gentleman and said coldly but decisively, "I think the House is desirous of hearing the argument of counsel, and not of putting questions to him." In an eloquent tribute to his memory in the House of Lords, Lord Chief Justice Coleridge expressed the high opinion of the legal profession upon his merits, and upon the severe integrity and single-minded desire to do his duty which animated him in his selections for the bench. As far as the higher judicial appointments filled by Lord Cairns were concerned, such eulogy was not undeserved. Giffard, V.C., Hayes, Brett, Cleasby, Archibald, Field,

Lindley, Huddleston, Manisty, Hawkins, Lopes, Fry, Stephen, and Bowen, form a list with which no Chancellor need be ashamed to figure in the history of his profession, while he was also responsible for the raising of Baggallay, Cotton, and Thesiger (son of his old rival, Lord Chelmsford) to the Court of Appeal. In filling up vacancies on the County Court bench, Lord Cairns was not quite so successful, but the complaints that were made did not contain charges of personal or political prejudice in favour of those appointed; they suggested rather that the best chance of success attended those whose religious views or professions were of the Evangelistic type. Of Lord Cairns's honourable desire, however, to act for the best in all things, few can doubt. His piety was reflected by that of his great opponent, rival and friend, Lord Selborne. Like Lord Selborne and Lord Hatherley, Cairns found leisure at his busiest for teaching in the Sunday-school, but it is not recorded of them (as of him) that they refused to undertake work at the bar on Saturdays, in order to devote that day to hunting. He used to say that his great incentive to hard work at his profession in early days was his desire to keep hunters, and he retained his keenness as a sportsman as long as he was able to indulge it. Of his personal characteristics, it may be said that he was a spare man, with a Scottish, not an Irish, cast of countenance. He was scrupulously neat in his personal appearance, faultless in bands and necktie, and fond of wearing a flower in his button-hole. His chilly manner, coupled with his somewhat austere religious principles, had no doubt much to do with the fact that he was never a popular man. His friends claimed for him a keen sense of humour, but it was not to be detected by those whose knowledge of him was professional rather than personal. Probably he thought the exhibition of humour incompatible with the dignity of high judicial position. Of his legal attainments there can be no doubt. His influence upon the legislation of the day was largely felt where questions affecting religion and the Church were involved, and in matters peculiarly affecting his own profession. His power was felt, as has been said, both when he was in office and when his party was in opposition. He had been chairman of the Committee on Judicature Reform, and although he was not in office when the Judicature Act was passed, all the reforms in the legal procedure of his day owed much to him. He took part, when out of office, in the passing of the Married Women's Property Act, and was directly responsible for the Conveyancing Acts of 1881-82, and for the Settled Land Act, which a Chancery judge (Mr Justice Byrne, in the *Law Magazine*, vol. xxv. p. 260) has called "the greatest real property revolution effected in England for centuries." Many other statutes in which he was largely concerned might be quoted. His judgments are to be found in the *Law Reports*, and those who wish to consider his oratory should read the speeches above referred to, or that delivered in the House of Lords on the Compensation for Disturbance Bill in 1880, and his memorable criticism of Mr Gladstone's policy in the Transvaal, after Majuba Hill. (See *Hansard and the Times*, 1st April 1881.) His style of delivery was, as a rule, cold to a marked degree. The term "frozen oratory" has been applied to his speeches, and it has been said of them that they flowed "like water from a glacier. . . . The several stages of his speech are like steps cut out in ice, as sharply defined, as smooth and as cold." Lord Cairns married in 1856 Mary Harriet, eldest daughter of Mr John Macneill, of Park Mount, county Antrim, by whom he had issue five sons and two daughters.

Cairns, a seaport and municipality in Queensland, Australia, in the county of Nares, about 900 miles N.W. of Brisbane, on Trinity Bay, with a fine and well-sheltered harbour. It is the natural outlet for the gold-fields, tin-mines, and silver-fields of the district and for the rich copper district of Chillagoe. In the vicinity are extensive sugar plantations, with sugar mills and refineries; the culture of coffee is rapidly extending, bananas and other fruits are exported in considerable quantities, and there is a large industry in cedar. Population, about 3000.

Cairo, the capital of modern Egypt, situated on the right bank of the Nile, 12 miles S. of the apex of the Delta, in 30° 2' N. lat. and 31° 15' E. long. It is 130 miles by rail from Alexandria, and from Suez it is distant 148 miles, though only 84 by the old overland route across the desert, before the opening of the Suez Canal. It occupies a length of 5 miles on the right bank of the Nile, from the old Roman fortress of Babylon on the S., to the new railway bridge on the N., and covers an area of about 8 square miles, occupying all the available space between the Nile and the Moqattam hills. It is built partly on the alluvial plain of the Nile valley and partly on the rocky slopes of the Moqattam hills, which rise to an altitude of 550 feet above the town, on a lower spur of which (200 feet) stands the Citadel. Though the eastern or native part has changed but little, whole new quarters have sprung up of late years to supply the demand created by the large increase of European population and the growing wealth of the country. Thus what in 1875 was an open space on the western side, is now a closely-built-over district, comprising the quarters of Qasr el Dubara on the south of the Qasr el Nil bridge; Ismaïlia, between this bridge and the main road leading to Bulaq; and Tewfiquia to the north of the main road. In these districts the houses are large, high, and well built, resembling those of southern Italy and France. In most cases they consist of residential flats, detached single houses being the exception, most of the latter being situated in the Qasr el Dubara quarter. To the south the rubbish mounds of ancient Fostat, the first Arab town on the site, have prevented any extension in that direction, but to the north and north-west growth has proceeded rapidly. Bulaq, the river port, is now a part of the city itself, and Abbassia, an outlying district on the edge of the desert, two miles from the wall of the old town, is now connected by a continuous line of houses. Large and luxurious hotels have been built in the newer quarters for the accommodation of the increasing number of visitors who arrive each winter; while on the island or "Gezira" of Bulaq are to be found polo, cricket, and tennis grounds, as well as a racecourse. On the west bank of the Nile, not far from the town of Giza, are the Zoological Gardens in the grounds of the former Khedivial palace of Giza. A large number of the newer houses are lighted with electric light, and electric trams traverse most of the principal streets. The improvement in the houses, the laying out of open spaces, and a good water-supply, have done much to improve the sanitary condition of the city, the death-rate for the native population being 37·5 and 36·7 per 1000 for the years 1898 and 1899 respectively. In recent years a railway bridge has been built across the Nile, a little to the north of Bulaq, so that the Upper Egypt line, which extends to Assuan, with a break of gauge at Luxor, passes over this bridge, and is now connected with the railway system of the Delta. To the

south of Cairo a short railway line runs to the town of Helwan, 14 miles distant, situated in the desert 3 miles from the river, and much frequented by invalids on account of its sulphur baths. With the increasing prosperity of the country the public buildings of Cairo are being gradually improved and rebuilt. The collection of Egyptian antiquities, formerly housed in a small building at Bulaq, was removed in 1889 to the Khedivial palace of Giza on the west bank of the Nile; a new museum has now been constructed close to the Qasr el Nil barracks, to which the collection will be transferred. More in the centre of the city have been built the new Law Courts, while close by is a large building which, when finished, will receive the Khedivial public library and the collections of the Museum of Arab Art. On the bank of the river, in the south part, the Medical School and the Government Hospital occupy the old palace of Qasr el Aini. A new Observatory will be built at Helwan, as the extension of the city northwards has rendered the present site quite unsuitable. Though it is inevitable that the Oriental character of much of the town will be replaced by modern European buildings, still much that is picturesque remains; and the careful and systematic renewal and restoration of the old mosques, fountains, &c., which represent the best styles of Arab art, are preserving much that is of interest and beauty which would otherwise have fallen into decay. In 1882 the population was 374,838, and in 1897 it amounted to 570,062, of which 35,385 were foreigners; the suburbs of Helwan and Mataria being included in the latter census, though not in the former.

(H. G. L.)

Cairo, capital of Alexandria county, Illinois, U.S.A., situated, at an altitude of 313 feet, in the southern part of the state where the Ohio joins the Mississippi in the bottom-lands. It is protected from floods by the levees which surround the place. Occupying a central position, it has a large river traffic, besides which five railways centre in it, giving it also extensive land traffic. Population (1880), 9011; (1890), 10,324; (1900), 12,566.

Cairolì, Benedetto (1825-1889), Italian statesman, was born at Pavia, 28th January 1825. From 1848 until the completion of Italian unity in 1870, his whole activity was devoted to the Risorgimento, as Garibaldian officer, political refugee, anti-Austrian conspirator, and deputy to Parliament. He commanded a volunteer company under Garibaldi in 1859 and 1860, being wounded slightly at Calatafimi, and severely at Palermo in the latter year. In 1866, with the rank of colonel, he assisted Garibaldi in Tyrol, in 1867 fought at Mentana, and in 1870 conducted the negotiations with Bismarck, during which the German Chancellor is alleged to have promised Italy possession of Rome and of her natural frontiers if the Democratic party could prevent an alliance between Victor Emmanuel and Napoleon. The prestige personally acquired by Benedetto Cairolì was augmented by that of his four brothers, who fell during the wars of Risorgimento, and by the heroic conduct of their mother. His refusal of all compensation or distinction further endeared him to the Italian people. When in 1876 the Left came into power, Cairolì, then a deputy of sixteen years' standing, became parliamentary leader of his party, and, after the fall of Depretis, Nicotera, and Crispi, formed his first Cabinet in March 1878 with a Francophil and Irredentist policy. After his marriage with the Countess Elena Sizzo of Trent, he permitted the Irredentist agitation to carry the country to the verge of a war with Austria. General irritation was caused by his policy of "clean hands" at the Berlin Congress, while the attempt of Passanante to assassinate King Humbert at Naples (12th December 1878)

caused his downfall, in spite of the courage displayed and the severe wound received by him in protecting the king's person on that occasion. On 3rd July 1879 he returned to power, and in the following November formed, with Depretis, a coalition ministry, in which he retained the Premiership and the Foreign Office. Confidence in French assurances, and belief that Great Britain would never permit the extension of French influence in North Africa, prevented him from foreseeing the French occupation of Tunis (11th May 1881). In view of popular indignation, he resigned in order to avoid making inopportune declarations to the Chamber. Thenceforward he practically disappeared from political life. In 1887 he received the Knighthood of the Annunziata, the highest Italian decoration, and on 8th August 1889 died while a guest of King Humbert in the royal palace of Capodimonte, near Naples.

(H. W. S.)

Caithness, the most northerly county of the Scottish mainland, bounded W. and S. by Sutherlandshire, E. by the German Ocean, and N. by the Pentland Firth.

Area and Population.—According to the last official estimate, the area (foreshore excluded) is 446,017 acres, or about 687 square miles. The population was in 1881, 38,865; in 1891, 37,177, of whom 17,472 were males and 19,705 females; in 1901, 33,859. Taking the land area only (438,878 acres or 685·7 square miles), the number of persons to the square mile in 1891 was 54, and the number of acres to the person 11·8. In the registration county, the decrease of population between 1881 and 1891 was 6·7 per cent. Between 1881 and 1891 the excess of births over deaths was 3950, and the decrease of the resident population 1474. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	677	175	1056	11·5
1890	738	163	970	11·65
1899	621	167	872	11·5

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	26·44	26·98	25·39	24·86	24·41
Death-rate . . .	16·95	16·84	19·18	16·55	17·39
Marriage-rate . .	4·38	4·56	4·26	4·48	4·67

The number of Gaelic-speaking persons in the county in 1891 was 4068, of whom 76 spoke Gaelic only, and there were 18 foreigners. Valuation in 1889-90, £132,795; 1899-1900, £114,105.

Administration.—The county returns a member to parliament. Wick (2773) is the only royal burgh, and the parliamentary burgh of Wick (7881) is one of the Northern group of burghs. Thurso (3938) and Pulteneytown (5502) are police burghs. There are 10 civil parishes, of which all but one are included in the combinations of Latheron and Thurso. The number of paupers and dependants in September 1899 was 1480. Caithness unites with Orkney and Shetland to form a sheriffdom, and there is a resident sheriff-substitute at Wick, who sits also at Thurso and Lybster.

Education.—Twelve school boards manage 63 schools, with an average attendance of 5504 in 1898-99, and there are 3 voluntary schools, with an average attendance of 200. There are academies at Wick and Thurso, and six other schools earned grants in 1898-99 for higher education. The county council spent £262 out of the "residue" grant in 1898 in subsidizing elementary schools and cookery classes, and in buying apparatus for technical classes.

Agriculture.—About two-fifths of the arable land are good, one-fifth is bad, and the rest medium. The cold, wet, and windy climate has been successfully counteracted by improving landlords and tenants, and a considerable part of the acreage is in large farms tilled in a thoroughly good style. Twenty-five per cent. of the land was under cultivation in 1898. According to the return of 1895, the average size of the 2694 holdings was 41 acres. Only 24·83 per cent. were under 5 acres, compared with 64·92 in the adjacent county of Sutherland; 59·28 were between 5 and 50, and 15·89 over 50 acres. The number between 50 and 100 was 201; between 100 and 300, 159; between 300 and 500, 38; between 500 and 1000, 21; and there were 9 over 1000. Oats are the vastly preponderant crop; wheat-growing has died out, and the barley acreage remains fairly constant at about 1000.

The following table gives the principal acreages at intervals of five years from 1880 :—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	105,551	35,953	16,967	26,688	25,359	584
1885	106,710	35,559	16,392	28,282	25,806	671
1890	109,082	36,419	16,764	30,505	25,231	161
1895	110,026	35,455	16,184	29,748	28,596	35
1899	111,869	35,113	16,051	32,205	28,438	59

The following table gives particulars of the live stock in the same years :—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calv.	Sheep.	Pigs.
1880	5177	19,746	7040	93,969	1559
1885	5021	20,030	7040	101,378	1736
1890	5431	20,664	7406	121,127	1928
1895	5580	21,646	7417	108,621	1806
1899	5653	21,780	7841	130,006	1495

Since the commencement of the operations of the Crofters Commission in 1886 down to the end of 1898, 1359 fair rents have been fixed in Caithness, rents amounting to £9032 were reduced to £6143, and of £12,600 of arrears £7051 was cancelled. In the same period, 117 applications for enlargement of holdings were dealt with, and 552 acres were added to existing holdings. Only 952 acres were under wood in 1895. According to the census of 1891, 4258 men and 1010 women were engaged in agriculture.

Industries and Trade.—Twelve thousand tons of pavement flags were quarried in 1895 and 22,089 tons, valued at £21,867, in 1899. It is fishing, however, that makes Caithness crofting possible. Thurso, Scrabster, Lybster, and Wick are the chief fishing ports. The following tables show particulars of the combined districts of Lybster and Wick, which may be taken as representing the county :—

Year.	Boats.			Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.	Value.			
1890	920	10,242	£55,304	£53,174	3807	£109,988
1898	659	6,594	£28,200	£47,064	2878	£124,935
1899	639	6,540	£35,538	£41,778	2353	£117,539

The value of the herring catch alone, in 1898, was £95,216. There were 6266 persons in 1899 employed in the two districts in connexion with the various branches of the sea fisheries. The salmon fisheries along the coast and at the mouths of rivers are of considerable value. A light railway (13 miles) from Wick to Lybster has been sanctioned.

Cajamarca, an interior department of northern Peru, with an area of 12,538 square miles, and a population (1896) of 442,412. It is divided into 7 provinces—Jaen, Chota, Hualgayoc, Colendin, Cajamarca, Contumara, and Cajabamba, the principal towns being Cajamarca and Cajamarquilla, with populations, respectively, of 12,000 and 8000.

Calabar. See NIGERIA.

Calabria, a territorial division of S. Italy, practically coincident with the "toe" of the "boot," and embracing the provinces of Catanzaro, Cosenza, and Reggio, with an area of 5819 sq. miles, and a population of 1,257,883 (1881), and of 1,375,760 (1901). Except the three provincial capitals, Reggio, Catanzaro, and Cosenza, the towns are mostly small. On the coast stand Cotrona, Gerace, Scilla, Palmi, Pizzo, Paola, and some others. Inland are Castrovillari, Corigliano, Rossano, Nicastro, Monteleone, Cittanova, Aciri, and San Giovanni.

Calafat, a town in Rumania (population, 7113 in

1900), on the left bank of the Danube, opposite Viddin. It was founded in the 14th century by Genoese colonists, who employed large numbers of workmen (Calfats) in repairing ships—which industry gave its name to the place. It is now an important centre of the grain trade, and is connected by railway with Craiova.

Calais, a seaport on the Strait of Dover in the arrondissement of Boulogne, department of Pas-de-Calais, France, 184 miles from Paris by rail. The manufacturing suburb of St Pierre-lès-Calais has been incorporated with the municipality. Important industries, besides the long-established manufacture of tulle and lace, of which the value exported in 1899 amounted to £3,267,860, are the manufacture of carriages, bicycles, motor cars, and telegraph cables; brewing, silk-milling, brick-making, and soap-making are also carried on. In outlying districts important industries are—the manufacture of chairs at Audruicq; iron-founding and quarrying at Marquise; the working of phosphates near Caffiers; and sugar-refining at Port d'Ardres, employing during the busy season about 1200 persons, with an output of sugar (1899-1900) of 22,000 tons. The fitting of machinery carried on in six establishments at Calais, Marquise, and Audruicq, employs about 8000 persons. There is a proposal to establish large shipbuilding yards at Calais, only fishing boats having hitherto been built here. The number of vessels entered and cleared respectively in 1899 was 2101, tonnage 812,815, and 2106, tonnage 786,735. Of this total, British vessels numbered 1432 entered, tonnage 392,786, and cleared 1443, tonnage 395,216. The produce of the fisheries, in which 88 boats were employed, was valued at £56,000. The total number of passengers carried between Dover and Calais in 1899 was 263,420. Port accommodation has been greatly improved. The entrance channel has a width between jetties of 430 feet, and a depth of 34 feet and 13 feet at high and low spring tides respectively. There are four principal basins, of which the East Tidal Basin (that used by the mail packets) has an area of 16 acres. The canal of Calais, 18½ miles long, connects the port with the Aa and the navigable waterways of the department. Inland canal traffic in 1899 amounted to 464,066 tons. Total value of imports 1899, £3,244,000; of exports, £6,732,000. There are a chamber of commerce, three hospitals, and two libraries. Population (1881), 12,446; St Pierre-lès-Calais, 30,155; (1891, including St Pierre-lès-Calais), 51,056; (1896), 50,818; (1901), 59,893.

Calais, a city of Washington county, Maine, U.S.A., at the head of navigation on St Croix river, a few miles above its mouth, and on the St Croix and Penobscot Railway. It has many lumber-mills and shipyards, and considerable commerce. Population (1880), 6173; (1890), 7290; (1900), 7655.

Calarasi, chief town of the district of the same name, Rumania, 223 miles from Bucarest, on the left bank of the Borcea branch of the Danube. It was formerly called Stirbey in honour of the prince of that name. It has a considerable export of wheat, linseed, hemp, and timber. Population (1895), 11,000; (1900), 11,024.

Calatafimi, a town of the province of Trapani, Sicily, Italy, 21 miles E. by S. from Trapani. A monument was erected in 1882 on the battlefield where Garibaldi defeated the Neapolitan forces in 1860. It has a trade in wine, olive oil, and sumach. Two and a half miles to the north-west are the ruins of the ancient city of Segesta. Population, about 10,500.

Calbayog, a town of 30,000 inhabitants, near the

west coast of Samar, Philippine Islands, on a small river of the same name, in 12° 3' N. It does an important export business in hemp, which is shipped to Manila. Rice and copra are also produced in considerable quantity, and there is fine timber close at hand. The climate is pleasant and healthful. The language is Visayan.

Calculating Machines. See MATHEMATICAL INSTRUMENTS.

Calcutta, the capital of British India, and also of the province of Bengal, is situated in 22° 34' N. lat. and 88° 24' E. long. It lies on the left or east bank of the Hooghly, about 80 miles above the sea. It covers an area of 20 square miles. Its population in 1881 was 549,376, and in 1891 it was 681,560. Adding the suburbs, the total population was 903,374; and if Howrah be also included, the grand total rises to 1,018,980. Classified according to religion, Hindus numbered 444,137, or 65 per cent.; Mahommedans, 203,173, or 30 per cent.; Christians, 28,997, or 4 per cent., of whom 12,516 were Europeans and 9818 Eurasians, leaving 6663 for native converts; Jains and Buddhists, 2693; Parsis, 166; "others," 2394. Of the total number of inhabitants, less than one-third were born in the city. The preliminary returns of the census of 1901 gave the population of Calcutta as 843,487, showing an increase of 24 per cent., the same rate of increase as in the preceding decade. Adding the suburbs, the total population is 1,121,664; and if Howrah be also included, the grand total rises to 1,279,511. Just two-thirds of the population are males.

Calcutta is a busy commercial centre, but most of the industries are carried on outside municipal limits. Howrah, on the opposite side of the Hooghly, is the terminus of three great railway systems, and also the headquarters of the jute industry and other large factories. It is connected with Calcutta by an immense floating bridge, 1530 feet in length, which was constructed in 1874. A project is now under consideration to build a railway bridge across the river, with a central station in Calcutta. Other railways have their terminus at Sealdah, an eastern suburb. The docks lie outside Calcutta, at Kidderpur, on the south; and at Alipur are the Zoological Gardens, the residence of the lieutenant-governor of Bengal, cantonments for a native infantry regiment, the central jail, and a Government reformatory. The port of Calcutta stretches about 10 miles along the river. It is under the control of a port trust, whose jurisdiction extends to the mouth of the Hooghly, and also over the floating bridge. During the five years ending 1897-98, the number of vessels entering the port rose from 991 to 1235, and the tonnage from 2,567,440 to 3,562,373. New docks were opened in 1892, which cost Rs.2,87,70,000; and a loan of Rs.15,00,000 was raised in 1898 for improvements in the docks and jetties and for new warehouses. In 1897-98 the total income of the port trust was Rs.61,85,000, and the total expenditure was Rs.61,05,000, of which Rs.21,19,000 represents debt and sinking fund. The total amount of liabilities outstanding was Rs.4,09,50,000, against which the port trust holds land, &c., estimated at a considerably higher value. The figures for the sea-borne trade of Bengal are included in those given for Bengal (*q.v.*) During the ten years ending 1897-98, imports of foreign merchandise rose in value from Rs.25,65,12,730 to Rs.27,85,49,500, or by 9 per cent.; while exports rose from Rs.36,63,69,890 to Rs.44,13,96,590, or by 20 per cent. In 1899-1900 the foreign trade amounted to £56,828,000 (imports, £23,511,000; exports, £33,317,000), of which 51 per cent. was trade with the United Kingdom and 8·4 per cent with the United States. The inland trade of Calcutta is registered as it enters or leaves the

city by country boat, by inland steamer, by rail, or by road. The following table gives the results of this registration for 1897-98:—

	Imports.	Exports.	Total.
	Rs.	Rs.	Rs.
By country boat .	13,22,03,507	3,57,87,627	16,79,91,134
By inland steamer .	7,72,75,288	5,37,08,677	13,09,83,965
By East Indian Railway .	27,99,37,306	23,23,18,027	51,22,55,333
By Eastern Bengal Railway .	9,30,86,345	5,58,64,506	14,89,50,851
By road .	4,20,44,354	2,23,47,509	6,43,91,863
Total .	62,45,46,800	40,00,26,346	1,02,45,73,146

More than half of the total is carried by the East Indian railway, which serves the North-Western Provinces. Country boats hold their own against inland steamers, especially in imports.

The municipal government of Calcutta has been reconstituted by an Act of the Bengal Legislature, passed in 1899. Previously, the governing body consisted of seventy-five commissioners, of whom fifty were elected. Under the new system, modelled upon that of the Bombay municipality, this body, styled the Corporation, remains comparatively unaltered; but a large portion of their powers is transferred to a general committee, composed of twelve members, of whom one-third are elected by the Corporation, one-third by certain public bodies, and one-third are nominated by the Government. At the same time, the authority of the chairman, as supreme executive officer, is considerably strengthened. The two most important works undertaken by the old municipality were the provision of a supply of filtered water and the construction of a main drainage system. The water-supply is derived from the river Hooghly, about 16 miles above Calcutta, where there are large pumping-stations and settling-tanks. The total length of the main is 315 miles. In 1897-98 the daily supply of filtered water was more than 20 million gallons, being 38 gallons per head of population. In addition, there was a daily supply of more than 5 million gallons of unfiltered water, being 12 gallons per head. The drainage system consists of underground sewers, which are discharged by a pumping-station into a natural depression to the eastward, called the Salt Lake. Refuse is also removed to the Salt Lake by means of a municipal railway.

The following table gives the principal heads of municipal income and expenditure in 1897-98:—

Income.		Expenditure	
	Rs.		Rs.
General rate . .	17,79,106	Interest of debt .	5,99,200
Sewage rate . .	3,74,540	Repayment of debt .	2,44,615
Water rate . .	11,28,621	General establishment	4,02,025
Lighting rate . .	3,74,540	Office . .	1,04,884
Taxes on trades, carriages, &c. . .	5,31,809	Roads . .	3,60,446
Market . .	1,33,556	Street watering . .	93,278
Sale of water . .	1,55,219	Gowkhana . .	2,17,501
Conservancy . .	64,790	Conservancy . .	1,57,616
Roads . .	34,975	Busti cleaning . .	80,231
Slaughter-house .	41,148	Sewer cleaning, &c.	1,23,430
Miscellaneous . .	1,37,756	Hospital and vaccination .	67,102
Total . .	47,51,060	Suburban improvements .	37,834
		Sewers . .	2,72,006
		Water . .	11,79,085
		Lighting . .	4,56,098
		Miscellaneous . .	4,40,682
		Total . .	48,45,592

The total amount levied by rate was Rs.36,51,807, the incidence of taxation being nearly Rs.7 per head. The assessment of the annual valuation of the city amounts to Rs.2,08,54,607. The

outstanding liabilities at the close of the year were Rs.2,67,72,379, the rates of interest ranging from 5 to 3½ per cent.

The Calcutta University was constituted in 1857, as an examining body, on the model of the University of London. During the five years ending 1897, the total number of persons who matriculated was 12,602, while 1830 graduated B.A., and 329 M.A., 627 passed examinations in law, 925 in medicine, and 92 in engineering. The chief educational institutions are the Government Presidency College (with 497 students in 1897), three aided missionary colleges (with a total of 1315 students), and four unaided native colleges (with a total of 1474 students); the Sanskrit College and the Mahomedan Madrasah, the Government medical college (with 468 students), the Government engineering college at Sibpur, on the opposite bank of the Hooghly (with 310 students), the Government school of art (with 261 students), 49 high schools for boys, which passed 465 candidates for the matriculation; the Bethune College, and 4 high schools for girls. In 1896-97 the total number of pupils under instruction was 47,295, the proportion to population of school-going age being 81 per cent. for boys and 21 per cent. for girls.

Calcutta has been comparatively fortunate in escaping the plague. The disease manifested itself in a sporadic form in April 1898, but disappeared by September of that year. Many of the Marwari traders fled the city, and some trouble was experienced in shortness of labour in the factories and at the docks. The plague returned in 1899, and caused a heavy mortality during the early months of the following year; but the population was not demoralised, nor was trade interfered with. A yet more serious outbreak occurred in the early months of 1901. The total death-rate in 1900 was 43.54 per thousand, the number of deaths from plague being 8354, compared with 2332 in the preceding year.

Though Calcutta has been called "the city of palaces," its modern public buildings cannot compare with those of Bombay. Its chief glory is the Maidan, or Park, which is large enough to embrace the area of Fort William and a racecourse. Many monuments find a place on the Maidan, amongst the latest additions being two equestrian statues of Lord Roberts and Lord Lausdowne, which face one another on each side of the Red Road, where the rank and fashion of Calcutta take their evening drive. In the north-eastern corner of the Maidan it is proposed to erect the Indian memorial to Queen Victoria, consisting of a marble hall, with a statue and historical relics. The Government has acquired Metcalfe Hall, in order to convert it into a public library and reading-room worthy of the capital of India; and also the country-house of Warren Hastings at Alipur, for the entertainment of Indian princes. Lord Curzon has restored, at his own cost, the monument which formerly commemorated the massacre of the Black Hole. A wide street, called Harrison Road in memory of a former chairman of the municipality, has been run through the centre of the city, in continuation of the line of the Hooghly bridge; but much yet remains to be done to open up the native quarters, which are densely built over, regardless of sanitary requirements. (J. S. Co.)

Caldecott, Randolph (1846-1886), English artist and illustrator, was born at Chester on 22nd March 1846. From 1861 to 1872 he was a bank clerk, first at Whitchurch in Shropshire, afterwards at Manchester; but devoted all his spare time to the cultivation of a remarkable artistic faculty. In 1872 he migrated to London, became a student at the Slade School, and finally adopted the artist's profession. He gained immediately a wide reputation as a prolific and original illustrator, gifted

with a genial, humorous faculty, and he succeeded also, though in less degree, as a painter and sculptor. His health gave way in 1876, and after prolonged suffering, he died in Florida on 12th February 1886. His chief book illustrations are as follows: *Old Christmas* (1876) and *Bracebridge Hall* (1877), both by Washington Irving; *North Italian Folk* (1877), by Mrs Comyns Carr; *The Harz Mountains* (1883); *Breton Folk* (1879), by Henry Blackburn; picture-books (*John Gilpin*, *The House that Jack Built*, and other children's favourites) from 1878 onwards; *Some Aesop's Fables with Modern Instances*, &c. (1883). He held a roving commission for the *Graphic*, and was an occasional contributor to *Punch*. He was a member of the Royal Institute of Painters in Water-colours.

See HENRY BLACKBURN: *Randolph Caldecott, Personal Memoir of his Early Life*. London, 1886. (A. L. B.)

Calgary, a port of entry and the principal town of Alberta, Canada, situated 840 miles by rail W. of Winnipeg, at the junction of the main line and Edmonton and Macleod branches of the Canadian Pacific railway, in 51° 02' N. lat. and 114° 04' W. long., at an altitude of 3421 feet above the sea. It is the centre of the ranching country and the main distributing point for the district. The population in 1901 was 4865.

Cali, a town in the department of Cauca, Colombia, South America, situated on the Cali. The river is spanned by a handsome bridge, and the town has 7 churches, several convents, and a number of good public buildings. Its population is 16,000.

Calibration.—The term Calibration primarily signifies the determination of the "calibre" or bore of a gun. The word *calibre* was introduced through the French from the Italian *calibro*, together with other terms of gunnery and warfare, about the 16th century. The origin of the Italian equivalent appears to be uncertain. It will readily be understood that the calibre of a gun requires accurate adjustment to the standard size, and further, that the bore must be straight and of uniform diameter throughout. The term was subsequently applied to the accurate measurement and testing of the bore of any kind of tube, especially those of thermometers. In modern scientific language, by a natural process of transition, it has come to denote the accurate comparison of any measuring instrument with a standard, and more particularly the determination of the errors of its scale. It is seldom possible in the process of manufacture to make an instrument so perfect that no error can be discovered by the most delicate tests, and it would rarely be worth while to attempt to do so even if it were possible. The cost of manufacture would in many cases be greatly increased without adding materially to the utility of the apparatus. The scientific method, in all cases which admit of the subsequent determination and correction of errors, is to economize time and labour in production by taking pains in the subsequent verification or calibration. This process of calibration is particularly important in laboratory research, where the observer has frequently to make his own apparatus, and cannot afford the time or outlay required to make special tools for fine work, but is already provided with apparatus and methods of accurate testing. For non-scientific purposes it is generally possible to construct instruments to measure with sufficient precision without further correction. The present article will therefore be restricted to the scientific use and application of methods of accurate testing.

General Methods and Principles.—The process of calibration of any measuring instrument is frequently divisible into two parts, which differ greatly in importance in different cases, and of which one or the other may often

be omitted. (1) The determination of the value of the unit to which the measurements are referred by comparison with a standard unit of the same kind. This is often described as the *Standardization* of the instrument, or the determination of the *Reduction factor*. (2) The verification of the accuracy of the subdivision of the scale of the instrument. This may be termed *calibration* of the scale, and does not necessarily involve the comparison of the instrument with any independent standard, but merely the verification of the accuracy of the relative values of its indications. In many cases the process of calibration adopted consists in the comparison of the instrument to be tested with a standard over the whole range of its indications, the relative values of the subdivisions of the standard itself having been previously tested. In this case the distinction of two parts in the process is unnecessary, and the term calibration is for this reason frequently employed to include both. In some cases it is employed to denote the first part only, but for greater clearness and convenience of description we shall restrict the term as far as possible to the second meaning.

The methods of standardization or calibration employed have much in common even in the cases that appear most diverse. They are all founded on the axiom that "things which are equal to the same thing are equal to one another." Whether it is a question of comparing a scale with a standard, or of testing the equality of two parts of the same scale, the process is essentially one of interchanging, or substituting one for the other, the two things to be compared. In addition to the things to be tested there is usually required some form of balance, or comparator, or gauge, by which the equality may be tested. The simplest of such comparators is the instrument known as the *callipers*, from the same root as *calibre*, which is in constant use in the workshop for testing equality of linear dimensions, or uniformity of diameter of tubes or rods. The more complicated forms of optical comparators or measuring machines with scales and screw adjustments, are essentially similar in principle, being finely adjustable gauges to which the things to be compared can be successively fitted. A still simpler and more accurate comparison is that of volume or capacity, using a given mass of liquid as the gauge or test of equality, which is the basis of many of the most accurate and most important methods of calibration. The common balance, for testing equality of mass or weight, is so delicate and so easily tested, that the process of calibration may frequently with advantage be reduced to a series of weighings, as for instance in the calibration of a burette or measure-glass by weighing the quantities of mercury required to fill it to different marks. The balance may, however, be regarded more broadly as the type of a general method capable of the widest application in accurate testing. It is possible, for instance, to balance two electromotive forces or two electrical resistances against each other, or to measure the refractivity of a gas by balancing it against a column of air adjusted to produce the same retardation in a beam of light. These "equilibrium," or "null," or "balance" methods of comparison afford the most accurate measurements, and are generally selected if possible as the basis of any process of calibration. In spite of the great diversity in the nature of the things to be compared, the fundamental principles of the methods employed are so essentially similar that it is possible, for instance, to describe the testing of a set of weights, or the calibration of an electrical resistance-box, in almost the same terms, and to represent the calibration correction of a mercury thermometer or of an ammeter by precisely similar curves.

Method of Substitution.—In comparing two units of the same kind and of nearly equal magnitude, some variety of the general method of substitution is invariably adopted. The same method in a more elaborate form is employed in the calibration of a series of multiples or submultiples of any unit. The details of the method depend on the system of subdivision adopted, which is to some extent a matter of taste. The simplest method of subdivision is that on the binary scale, proceeding by multiples of 2. With a pair of submultiples of the smallest denomination and one of each of the rest, thus 1, 1, 2, 4, 8, 16, &c., each weight or multiple is equal to the sum of all the smaller weights, which may be substituted for it, and the small difference, if any, observed. If we call the weights *A*, *B*, *C*, &c., where each is approximately double the following weight, and if we write *a* for observed excess of *A* over the rest of the weights, *b* for that of *B* over *C* + *D* + &c., and so on, the observations by the method of substitution give the series of equations,

$$A - \text{rest} = a, B - \text{rest} = b, C - \text{rest} = c, \text{ \&c.} \quad (1).$$

Subtracting the second from the first, the third from the second,

and so on, we obtain at once the value of each weight in terms of the preceding, so that all may be expressed in terms of the largest, which is most conveniently taken as the standard

$$B = A/2 + (b - a)/2, C = B/2 + (c - b)/2, \text{ \&c.} \quad (2).$$

The advantages of this method of subdivision and comparison, in addition to its extreme simplicity, are (1) that there is only one possible combination to represent any given weight within the range of the series; (2) that the least possible number of weights is required to cover any given range; (3) that the smallest number of substitutions is required for the complete calibration. These advantages are important in cases where the accuracy of calibration is limited by the constancy of the conditions of observation, as in the case of an electrical resistance-box, but the reverse may be the case when it is a question of accuracy of estimation by an observer.

In the majority of cases the ease of numeration afforded by familiarity with the decimal system is the most important consideration. The most convenient arrangement on the decimal system for purposes of calibration is to have the units, tens, hundreds, &c., arranged in groups of four adjusted in the proportion of the numbers 1, 2, 3, 4. The relative values of the weights in each group of four can then be determined by substitution independently of the others, and the total of each group of four, making ten times the unit of the group, can be compared with the smallest weight in the group above. This gives a sufficient number of equations to determine the errors of all the weights by the method of substitution in a very simple manner. A number of other equations can be obtained by combining the different groups in other ways, and the whole system of equations may then be solved by the method of least squares; but the equations so obtained are not all of equal value, and it may be doubted whether any real advantage is gained in many cases by the multiplication of comparisons, since it is not possible in this manner to eliminate constant errors or personal equation, which are generally aggravated by prolonging the observations. A common arrangement of the weights in each group on the decimal system is 5, 2, 1, 1, or 5, 2, 1. These do not admit of the independent calibration of each group by substitution. The arrangement 5, 2, 1, 1, 1, or 5, 2, 1, 1, 1, permits independent calibration, but involves a larger number of weights and observations than the 1, 2, 3, 4, grouping. The arrangement of ten equal weights in each group, which is adopted in "dial" resistance-boxes, and in some forms of chemical balances where the weights are mechanically applied by turning a handle, presents great advantages in point of quickness of manipulation and ease of numeration, but the complete calibration of such an arrangement is tedious, and in the case of a resistance-box it is difficult to make the necessary connexions. In all cases where the same total can be made up in a variety of ways, it is necessary in accurate work to make sure that the same weights are always used for a given combination, or else to record the actual weights used on each occasion. In many investigations where time enters as one of the factors, this is a serious drawback, and it is better to avoid the more complicated arrangements. The accurate adjustment of a set of weights is so simple a matter that it is often possible to neglect the errors of a well-made set, and no calibration is of any value without the most scrupulous attention to details of manipulation, and particularly to the correction for the air displaced in comparing weights of different materials. Electrical resistances are much more difficult to adjust owing to the change of resistance with temperature, and the calibration of a resistance-box can seldom be neglected on account of the changes of resistance which are liable to occur after adjustment from imperfect annealing. It is also necessary to remember that the order of accuracy required and the actual values of the smaller resistances depend to some extent on the method of connexion, and that the box must be calibrated with due regard to the conditions under which it is to be used. Otherwise the method of procedure is much the same as in the case of a box of weights, but it is necessary to pay more attention to the constancy and uniformity of the temperature conditions of the observing-room.

Method of Equal Steps.—In calibrating a continuous scale divided into a number of divisions of equal length, such as a metre scale divided in millimetres, or a thermometer tube divided in degrees of temperature, or an electrical slide-wire, it is usual to proceed by a method of equal steps. The simplest method is that known as the method of Gay-Lussac in the calibration of mercurial thermometers or tubes of small bore. It is essentially a method of substitution employing a column of mercury of constant volume as the gauge for comparing the capacities of different parts of the tube. A precisely similar method, employing a pair of microscopes at a fixed distance apart as a standard of length, is applicable to the calibration of a divided scale. The interval to be calibrated is divided into a whole number of equal steps or sections, the points of division at which the corrections are to be determined are called *points of calibration*.

Calibration of a Mercury Thermometer.—To facilitate description, we will take the case of a fine-bore tube, such as that of a thermometer, to be calibrated with a thread of mercury. The bore of such a tube will generally vary considerably even in the best standard instruments, the tubes of which have been specially drawn and selected. The correction for inequality of bore may amount to a quarter or half a degree, and is seldom less than a tenth. In ordinary chemical thermometers it is usual to make allowance for variations of bore in graduating the scale, but such instruments present discontinuities of division, and cannot be used for accurate work, in which a finely-divided scale of equal parts is essential. The calibration of a mercury thermometer intended for work of precision is best effected after it has been sealed. A thread of mercury of the desired length is separated from the column. The exact adjustment of the length of the thread requires a little manipulation. The thermometer is inverted and tapped to make the mercury run down to the top of the tube, thus collecting a trace of residual gas at the end of the bulb. By quickly reversing the thermometer the bubble passes to the neck of the bulb. If the instrument is again inverted and tapped, the thread will probably break off at the neck of the bulb, which should be previously cooled or warmed so as to obtain in this manner, if possible, a thread of the desired length. If the thread so obtained is too long or not accurate enough, it is removed to the other end of the tube, and the bulb further warmed till the mercury reaches some easily recognized division. At this point the broken thread is rejoined to the mercury column from the bulb, and a microscopic bubble of gas is condensed which generally suffices to determine the subsequent breaking of the mercury column at the same point of the tube. The bulb is then allowed to cool till the length of the thread above the point of separation is equal to the desired length, when a slight tap suffices to separate the thread. This method is difficult to work with short threads owing to deficient inertia, especially if the tube is very perfectly evacuated. A thread can always be separated by local heating with a small flame, but this is dangerous to the thermometer, it is difficult to adjust the thread exactly to the required length, and the mercury does not run easily past a point of the tube which has been locally heated in this manner.

Having separated a thread of the required length, the thermometer is mounted in a horizontal position on a suitable support, preferably with a screw adjustment in the direction of its length. By tilting or tapping the instrument the thread is brought into position corresponding to the steps of the calibration successively, and its length in each position is carefully observed with a pair of reading microscopes fixed at a suitable distance apart. Assuming that the temperature remains constant, the variations of length of the thread are inversely as the variations of cross-section of the tube. If the length of the thread is very nearly equal to one step, and if the tube is nearly uniform, the average of the observed lengths of the thread, taking all the steps throughout the interval, is equal to the length which the thread should have occupied in each position had the bore been uniform throughout and all the divisions equal. The error of each step is therefore found by subtracting the average length from the observed length in each position. Assuming that the ends of the interval itself are correct, the correction to be applied at any point of calibration to reduce the readings to a uniform tube and scale, is found by taking the sum of the errors of the steps up to the point considered with the sign reversed.

In the following example of the method an interval of ten degrees is taken, divided into ten steps of 1° each. The distances of the ends of the thread from the nearest degree divisions are estimated by the aid of micrometers to the thousandth of a degree. The error of any one of these readings probably does not exceed half a thousandth, but they are given to the nearest thousandth only. The excess length of the thread in each position over the corresponding degree is obtained by subtracting the second reading from the first. Taking the average of the numbers in this line, the mean excess-length is -10.4 thousandths. The error of each step is found by subtracting this mean from each of the numbers in the previous line. Finally, the corrections at each degree are obtained by adding up the errors of the steps and changing the sign. The errors and corrections are given in thousandths of 1° .

TABLE I.—Calibration by Method of Gay-Lussac.

No. of Step.	1	2	3	4	5	6	7	8	9	10
Ends of thread	+010	-016	-020	-081	+016	+008	+013	+017	+004	-008

Complete Calibration.—The simple method of Gay-Lussac does very well for short intervals when the number of steps is not excessive, but it would not be satisfactory for a large range owing to the accumulation of small errors of estimation, and the variation of the personal equation. The observer might, for instance, consistently over-estimate the length of the thread in one half of the tube, and under-estimate it in the other. The errors near the middle of the range would probably be large. It is evident that the correction at the middle point of the interval could be much more accurately determined by using a thread equal to half the length of the interval. To minimize the effect of these errors of estimation, it is usual to employ threads of different lengths in calibrating the same interval, and to divide up the fundamental interval of the thermometer into a number of subsidiary sections for the purpose of calibration, each of these sections being treated as a step in the calibration of the fundamental interval. The most symmetrical method of calibrating a section, called by Guillaume a "Complete Calibration," is to use threads of all possible lengths which are integral multiples of the calibration step. In the example already given nine different threads were used, and the length of each was observed in as many positions as possible. Proceeding in this manner the following numbers were obtained for the excess-length of each thread in thousandths of a degree in different positions, starting in each case with the beginning of the thread at 0° , and moving it on by steps of 1° .

TABLE II.—Complete Calibration of Interval of 10° in 10 Steps.

Lengths of Threads.	1°	2°	3°	4°	5°	6°	7°	8°	9°
excess -	0	-28	-32	-67	-62	-11	-15	-48	-2
lengths of threads in various positions, the beginning of the thread being set near the points	1°	-38	-21	-47	-28	+14	-8	-22	+21
	2°	-17	+2	-8	+1	+26	+23	+6	+58
	3°	-9	+26	+5	-3	+41	+36	+28	
	4°	+6	+31	-7	+4	+45	+40		
	5°	+3	+5	-15	-6	+43			
	6°	-20	+7	-16	+2				
	7°	+1	+23	+10					
	8°	+4	+29						
	9°	+5							

The observations in the first column are the excess-lengths of the thread of 1° already given in illustration of the method of Gay-Lussac. The other columns give the corresponding observations with the longer threads. The simplest and most symmetrical method of solving these observations, so as to find the errors of each step in terms of the whole interval, is to obtain the differences of the steps in pairs by subtracting each observation from the one above it. This method eliminates the unknown lengths of the threads, and gives each observation approximately its due weight. Subtracting the observations in the second line from those in the first, we obtain a series of numbers, entered in column 1 of the next table, representing the excess of step (1) over each of the other steps. The sum of these differences is ten times the error of the first step, since by hypothesis the sum of the errors of all the steps is zero in terms of the whole interval. The numbers in the second column of Table III. are similarly obtained by subtracting the third line from the second in Table II., each difference being inserted in its appropriate place in the table. Proceeding in this way we find the excess of each interval over those which follow it. The table is completed by a diagonal row of zeros representing the difference of each step from itself, and by repeating the numbers already found in symmetrical positions with their signs changed, since the excess of any step, say 6 over 3, is evidently equal to that of 3 over 6 with the sign changed. The errors of each step having been found by adding the columns, and dividing by 10, the corrections at each point of the calibration are deduced as before.

TABLE III.—Solution of Complete Calibration.

Step No.	1	2	3	4	5	6	7	8	9	10
1	0	-5	+11	+20	+34	+25	+7	+26	+23	+32
2	+5	0	+16	+23	+39	+29	+12	+31	+28	+37
3	-11	-16	0	+8	+24	+13	-4	+15	+13	+22
4	-20	-23	-8	0	+15	+5	-12	+7	+4	+13
5	-34	-39	-24	-15	0	-9	-26	-8	-10	-2
6	-25	-29	-13	-5	+9	0	-17	+2	-1	+8
7	-7	-12	+4	+12	+26	+17	0	+19	+16	+26
8	-26	-31	-15	-7	-8	-2	-19	0	-3	+6
9	-23	-28	-13	-4	+10	+1	-16	+8	0	+9
10	-32	-37	-22	-13	+2	-8	-26	-6	-9	0
Error of step.	-17.8	-22.0	-6.4	+1.9	+16.7	+7.1	-10.1	+8.9	+6.1	+15.1
Correc- tions.	+17.8	+39.3	+45.7	+43.8	+27.1	+20.0	+30.1	+21.2	+15.1	0

The advantages of this method are the simplicity and symmetry of the work of reduction, and the accuracy of the result, which

exceeds that of the Gay-Lussac method in consequence of the much larger number of independent observations. It may be noticed, for instance, that the correction at point 5 is 27.1 thousandths by the complete calibration, which is 2 thousandths less than the value 29 obtained by the Gay-Lussac method, but agrees well with the value 27 thousandths obtained by taking only the first and last observations with the thread of 5°. The disadvantage of the method lies in the great number of observations required, and in the labour of adjusting so many different threads to suitable lengths. It is probable that sufficiently good results may be obtained with much less trouble by using fewer threads, especially if more care is taken in the micrometric determination of their errors.

The method adopted for dividing up the fundamental interval of any thermometer into sections and steps for calibration may be widely varied, and is necessarily modified in cases where auxiliary bulbs or "ampoules" are employed. The Paris mercury standards, which read continuously from 0° to 100° C., without intermediate ampoules, were calibrated by Chappuis in five sections of 20° each, to determine the corrections at the points 20°, 40°, 60°, 80°, which may be called the "principal points" of the calibration, in terms of the fundamental interval. Each section of 20° was subsequently calibrated in steps of 2°, the corrections being at first referred, as in the example already given, to the mean degree of the section itself, and being afterwards expressed, by a simple transformation, in terms of the fundamental interval, by means of the corrections already found for the ends of the section. Supposing, for instance, that the corrections at the points 0° and 10° of Table III. are not zero, but C^0 and C' respectively, the correction C_n at any intermediate point n will evidently be given by the formula,

$$C_n = C^0 + c_n + (C' - C^0)n/10 \quad (3)$$

where c_n is the correction already given in the table.

If the corrections are required to the thousandth of a degree, it is necessary to tabulate the results of the calibration at much more frequent intervals than 2°, since the correction, even of a good thermometer, may change by as much as 20 or 30 thousandths in 2°. To save the labour and difficulty of calibrating with shorter threads, the corrections at intermediate points are usually calculated by a formula of interpolation. This leaves much to be desired, as the section of a tube often changes very suddenly and capriciously. It is probable that the graphic method gives equally good results with less labour.

Slide-Wire.—The calibration of an electrical slide-wire into parts of equal resistance is precisely analogous to that of a capillary tube into parts of equal volume. The Carey Foster method, employing short steps of equal resistance, effected by transferring a suitable small resistance from one side of the slide-wire to the other, is exactly analogous to the Gay-Lussac method, and suffers from the same defect of the accumulation of small errors unless steps of several different lengths are used. The calibration of a slide-wire, however, is much less troublesome than that of a thermometer tube for several reasons. It is easy to obtain a wire uniform to one part in 500 or even less, and the section is not liable to capricious variations. In all work of precision the slide-wire is supplemented by auxiliary resistances by which the scale may be indefinitely extended. In accurate electrical thermometry, for example, the slide-wire itself would correspond to only 1°, or less, of the whole scale, which is less than a single step in the calibration of a mercury thermometer, so that an accuracy of a thousandth of a degree can generally be obtained without any calibration of the slide-wire. In the rare cases in which it is necessary to employ a long slide-wire, such as the cylinder potentiometer of Latimer Clark, the calibration is best effected by comparison with a standard, such as a Thomson-Variety slide-box.

Graphic Representation of Results.—The results of a calibration are often best represented by means of a correction curve, such as that illustrated in the diagram, which is plotted to represent the corrections found in Table III. The abscissa of such a curve is the reading of the instrument to be corrected. The ordinate is the correction to be added to the observed reading to reduce to a uniform scale. The corrections are plotted in the figure in terms of the whole section, taking the correction to be zero at the beginning and end. As a matter of fact the corrections at these points in terms of the fundamental interval were found to be -29 and -9 thousandths respectively. The correction curve is transformed to give corrections in terms of the fundamental interval by ruling a straight line joining the points +29 and +9 respectively, and reckoning the ordinates from this line instead of from the base-

line. Or the curve may be replotted with the new ordinates thus obtained. In drawing the curve from the corrections obtained at the points of calibration, the exact form of the curve is to some extent a matter of taste, but the curve should generally be drawn as smoothly as possible on the assumption that the changes are gradual and continuous.

The ruling of the straight line across the curve to express the corrections in terms of the fundamental interval, corresponds to the first part of the process of

calibration mentioned above under the term "Standardization." It effects the reduction of the readings to a common standard, and may be neglected if relative values only are required. A precisely analogous correction occurs in the case of electrical instruments. A potentiometer, for instance, if correctly graduated or calibrated in parts of equal resistance, will give correct relative values of any differences of potential within its range if connected to a constant cell to supply the steady current through the slide-wire. But to determine at any time the actual value of its readings in volts, it is necessary to standardize it, or determine its scale-value or reduction-factor, by comparison with a standard cell.

A very neat use of the calibration curve has been made by Prof. Rogers in the automatic correction of screws of dividing machines or lathes. It is possible, by the process of grinding as applied by Rowland (see *Ency. Brit.* vol. xxi. pp. 552-3), to make a screw which is practically perfect in point of uniformity, but even in this case errors may be introduced by the method of mounting. In the production of divided scales, and more particularly in the case of optical gratings, it is most important that the errors should be as small as possible, and should be automatically corrected during the process of ruling. With this object a scale is ruled on the machine, and the errors of the uncorrected screw are determined by calibrating the scale. A metal template may then be cut out in the form of the calibration-correction curve on a suitable scale. A lever projecting from the nut which feeds the carriage or the slide-rest is made to follow the contour of the template, and to apply the appropriate correction at each point of the travel, by turning the nut through a small angle on the screw. A small periodic error of the screw, recurring regularly at each revolution, may be similarly corrected by means of a suitable cam or eccentric revolving with the screw and actuating the template. This kind of error is important in optical gratings, but is difficult to determine and correct.

Calibration by Comparison with a Standard.—The commonest and most generally useful process of calibration is the direct comparison of the instrument with a standard over the whole range of its scale. It is necessary that the standard itself should have been already calibrated, or else that the law of its indications should be known. A continuous current ammeter, for instance, can be calibrated, so far as the relative values of its readings are concerned, by comparison with a tangent galvanometer, since it is known that the current in this instrument is proportional to the tangent of the angle of deflexion. Similarly an alternating current ammeter can be calibrated by com-

parison with an electro-dynamometer, the reading of which varies as the square of the current. But in either case it is necessary, in order to obtain the readings in amperes, to standardize the instrument for some particular value of the current by comparison with a voltmeter, or in some equivalent manner. Whenever possible, ammeters and voltmeters are calibrated by comparison of their readings with those of a potentiometer, the calibration of which can be reduced to the comparison and adjustment of resistances, which is the most accurate of electrical measurements. The commoner kinds of mercury thermometers are generally calibrated and graduated by comparison with a standard. In many cases this is the most convenient, or even the only possible method. A mercury thermometer of limited scale reading between 250° and 400° C., with gas under high pressure to prevent the separation of the mercury column, cannot be calibrated on itself, or by comparison with a mercury standard possessing a fundamental interval, on account of difficulties of stem exposure and scale. The only practical method is to compare its readings every few degrees with those of a platinum thermometer under the conditions for which it is to be used. This method has the advantage of combining all the corrections for fundamental interval, &c., with the calibration correction in a single curve, except the correction for variation of zero which must be tested occasionally at some point of the scale.

AUTHORITIES.—**Mercurial Thermometers:** GUILLAUME, *Thermométrie de Précision*, Paris, 1889, gives several examples and references to original memoirs. The best examples of comparison and testing of standards are generally to be found in publications of Standards Offices, such as those of the Bureau International des Poids et Mesures at Paris. **Dial Resistance-Box:** GRIFFITHS, *Phil. Trans. A*, 1893. **Platinum Thermometry Box:** HARKER and CHAPINS, *Phil. Trans. A*, 1900. **Thomson-Varley Potentiometer and Binary Scale Box:** CALLENDAR and BARNES, *Phil. Trans. A*, 1901. For general electrical methods, see text-books and articles **ELECTRIC CURRENT**, &c. (H. L. C.)

Calicut, a city of British India, in the Malabar district of Madras; on the coast, 6 miles N. of Beypur. In 1881 the population was 57,805; in 1891 it was 66,078; and in 1901 it was 75,510, showing an increase of 14 per cent. The municipal income in 1897-98 was Rs.74,320. As the administrative headquarters of the district and the western terminus of the Madras railway, Calicut maintains its historical importance. It is now the chief seaport on the Malabar coast, with a lighthouse. In 1897-98 the number of vessels that entered and cleared for foreign trade was 30, with an aggregate of 23,016 tons. The principal exports are coffee, timber, and cocoa-nut products. There are factories for coffee-cleaning, employing several hundred hands; for coir-pressing and timber-cutting; and also tile-works. The town has a cotton-mill, with 18,424 spindles, employing 500 hands; an unaided native college, with 57 students in 1896-97; one missionary and two native high schools; six printing-presses, issuing two English and three vernacular newspapers; two reading-rooms and a club. A detachment of European troops is generally stationed here to overawe the fanatical Moplas.

California, the first and principal Pacific coast State of the American Union, second of all the States in size, with a gross area of 153,360 square miles (of which 155,980 square miles are land surface), and in 1900 twenty-first in population. It is bounded on the N. by Oregon, on the E. by Nevada and Arizona, on the S. by Mexico, and on the W. by the Pacific.

Population.—The following table shows the population and rate of increase at each census since California was admitted to the Union:—

Census Years.	Population.	Increase.	
		Number.	Per cent.
1850	92,597		
1860	379,994	287,397	310.3
1870	560,247	180,253	47.4
1880	864,694	304,447	54.3
1890	1,208,130	343,436	40.3
1900	1,485,053	276,923	22.4

In 1900, 1,117,813, or 75.3 per cent., were native-born, 367,240 foreign-born, as against 841,821 native-born and 366,309 foreign-born in 1890. The foreign-born include 45,753 Chinese (a falling-off of 25,313 in the decade), and 10,151 Japanese. There were 15,377 Indians, 11,045 persons of Negro descent. Of the total population, 820,531 were males, 664,522 females, a gain of 35,979 more females than males in the decade. Density of population (1900), 9.5 per square mile. The death-rate in 1900, on the basis of the deaths reported to the U.S. census enumerators in that year, was about 15.1. Of the total population 43.7 per cent. was urban (*i.e.*, resident in cities of more than 8000 inhabitants), which much exceeds the average of the United States. The chief cities and their population in 1900 were:—

City.	Population.	Increase since 1890.
San Francisco . . .	342,782	43,785
Los Angeles . . .	102,479	52,084
Oakland (suburb of S.F.)	66,960	18,278
Sacramento (State capital)	29,282	2,896
San José . . .	21,500	3,440
San Diego . . .	17,700	1,541
Stockton . . .	17,506	3,082
Alameda . . .	16,464	5,299
Berkeley (seat State Univ.)	13,214	8,113
Fresno . . .	12,470	1,652

There were (1900) 116 incorporated cities and towns, and 19 of them had populations of over 5000. Immense social and economic changes have taken place in California since 1876. Nearly all parts of the State have developed greatly, and particularly the seven counties south of the Tehachepi range, collectively and specifically known as "Southern California." The determining factor in the inequality of immigration was the first railway competition in California. The completion of a new trans-continental line to Southern California in 1885, and a startling railway "rate-war" soon afterwards, precipitated an immigration which in numbers, in distance travelled, and in average wealth, was probably unparalleled in history. In 1886 began an extraordinary "Land Boom" in Southern California, a wild speculation which was initiated almost entirely by the newcomers. The bubble burst in 1888, fortunately with little disaster, and substantial development has since been continuous. The special attractiveness of orange-growing also had much to do with the disproportionate growth of the southern end of the State; but development has extended over nearly the whole 900 miles of California north and south.

Education.—In 1890 the illiteracy of California was 7.7 per cent. as against 13.3 per cent. for the whole Union. The recent migration has probably reduced this illiteracy considerably, as it is almost wholly of educated people. In 1900, 6.2 per cent. of the total males of voting age, and 2.4 per cent. of the native-born males of voting age, were unable to write. California has one college student to every 419 of total population. The State University (at Berkeley) had in 1900 resources of over \$7,250,000, 1895 undergraduates (exceeded only by Harvard University), 463 instructors, and a total enrolment of 3226. Plans for a harmonious scheme of new buildings to cost \$10,000,000 were won in a competition open to the world by M. Benard of Paris. The university is liberally endowed by private benefactions, and is supported by a State tax of two cents on each \$100 of valuation. The Leland Stanford Jr. University was founded by Governor

Stanford and his wife, and was opened in 1891. It has a total endowment of over \$26,000,000, which is said to be the largest in the world. Its total enrolment is over 1500. Both universities are co-educational, and the female attendance is approximately one-third of the total. There were in 1900, 5 State normal schools, 120 high schools, 7119 kindergarten, primary, and grammar schools, with a total of 7706 teachers, 272,352 enrolled scholars, and total value of school property \$19,135,722. The total expenditure for public schools in 1900 was \$6,195,000. According to the U.S. census of 1900, the number of persons of school age (5 to 20 years inclusive) was 420,081.

Charitable and Reform Institutions.—California has two State prisons, two industrial reform schools, five asylums for the insane (with, in 1897, 4814 inmates, of whom 62 per cent. were of foreign birth), and a large number of public and private hospitals, asylums, orphanages, libraries, and associations and fraternities of all sorts. It is one of the few States in the Union which have an incorporated and active association to conserve historic landmarks.

Religion.—In 1890 the number of church edifices was 1505, with a seating capacity of 422,609; value of church property, nearly \$12,000,000; number of communicants, 280,619. Of these, 156,846 were Roman Catholics, about 37,000 Methodists, about 19,000 Presbyterians, and Baptists and Congregationalists between 11,000 and 12,000 each. The totals, however, greatly changed in the last decade of the 19th century.

Agriculture.—For thirty years after the American occupation gold and silver mining was the only great industry. Agriculture came into prominence in wheat-raising on ranches of from 50,000 to several hundred thousand acres in extent. A few of these, particularly in the Sacramento-San Joaquin valley, are still worked; but the majority of the old Spanish land grants have been subdivided into small farms, and the characteristic farming of California is now diversified, intensive, and on holdings of 20 acres and less. Horticulture is now the leading industry, and along a line about 500 miles north and south. Deciduous fruits are raised on a large scale from Humboldt county south to the Mexican line; the culture of citrus fruits preponderates in the five most southerly counties. Southern California is much more arid than the northern counties. Thousands of wells, artesian and other, have been sunk, and scores of horizontal tunnels driven. In 1899 alone, over 30,000 "Miners' inches," sufficient to irrigate 300,000 acres, were "developed" in the seven southern counties. Some of the largest storage dams and irrigating canals in the world are in California. The principal agricultural products in 1900 were:—

	Carloads.	
Oranges and lemons	18,400 . . .	\$18,000,000
Fresh tree fruit	9,695 . . .	9,695,000
Walnuts	558 } . . .	1,098,000
Almonds	232 } . . .	
Grapes }	5,578 . . .	3,578,400
Raisins }	5,858,000
Wines, sweet and dry	2,214,428
Brandies	3,426,800
Prunes, dried	5,711 . . .	6,850,000
Other cured fruits	3,425 . . .	6,575,000
Canned fruits and vegetables	1,170,871
Olive oil	1,375,000
Fresh vegetables shipped east	3,405 . . .	1,091,500
Hops	1,660,600
Beans	2,076 . . .	3,244,500
Beet sugar	255,000
Honey	141 . . .	21,000,000
Wheat	8,460,000
Barley	1,020,000
Oats	1,080,000
Corn	24,444,891
Alfalfa and other hay	1,105,815
Potatoes	12,830,797
Dairy products	2,266,560
Wool	

Total (not including many minor products) \$138,301,162 or over \$52,000,000 in excess of the greatest annual gold output. In 1875 these products, except grain, hay, and wool, were practically nil, and the State led only in gold and sheep. Wheat production has increased little since 1880, barley has about doubled, hay nearly trebled, sheep have declined over 50 per cent., as lands have become more valuable under diversified farming. The largest single influence of recent growth has been the citrus industry. In 1862 there were 25,000 orange-trees, all seedlings. In 1873 two seedless orange-trees from Brazil were sent to Riverside from the Department of Agriculture, and from these two trees the modern industry has sprung. Millions of trees from their buds are now bearing a seedless orange known as the "Washington navel," which has taken first rank in American

markets, and is not grown "commercially" anywhere except in California. There are now (nearly all in the seven southern counties) 4,120,470 orange and 1,432,829 lemon trees planted, or 55,540 acres. The shipments for 1900 were 18,400 carloads, or 6,624,000 boxes, worth \$18,000,000. The beauty of the groves, the fact that the crop is actually continuous (shipments being made every month in the year), and exceptional cases of fabulous profit (not infrequently up to \$1000 per acre, which is at least four times the average for competent growers), made the orange almost as epidemic a fever as gold had been. By reason of the co-operative effort demanded for the large problems of irrigation, packing, and marketing, the orange has done far more for the permanent development of the State than gold or other mining ever did.

Live stock numbered in 1900:—

Horses	321,729
Mules	48,682
Milch cows	308,872
Other cattle	604,881
Sheep	2,001,501
Swine (1899)	374,141

Mineral Products.—California is the second State in the Union in production of gold, having been exceeded in recent years by Colorado. It has, however, produced in gold since 1848 (to 1st January 1900) \$1,409,849,068—or more than all the rest of North America since 1492. California's capital and enterprise also developed the silver "Bonanzas" of Nevada, which produced over \$300,000,000 in twenty years. It produces about two-fifths of the quicksilver of the world. Since 1895 it has become a great producer of crude petroleum, and in 1900 ranked as fourth in America. Seventeen counties, in a line over 600 miles north and south, produce oil; in July 1900 there were 1590 producing wells and 470 prospect wells, and these figures were increasing daily. The production more than doubled in five years, and in 1899 was 2,677,875 barrels. The high cost of coal makes this oil deposit of peculiar value. Crude oil is already generally used for fuel in manufactures and even on railway locomotives. The total mineral output of the State for 1899 was:—

Gold	\$15,336,031
Copper	3,990,534
Petroleum	2,660,793
Quicksilver	1,405,045
Borax	1,139,882
Lime, limestone, cement	523,760
Silver	504,012
Asphalt and bituminous rock	424,227
Coal	420,109
Mineral waters	406,691
Soda	250,000
Salt	149,588
Other mineral products	2,102,788
Total	\$29,313,460

Gold production since 1875 has averaged from fifteen to sixteen millions a year. The total mineral output is now about 35 per cent. greater than it was in 1875.

Lumber Products.—California is one of the leading States in lumber products. Its sequoia, redwood, pine, and fir forests are the densest in "merchantable lumber" in the world. The redwoods cover about 2000 square miles. There is now a strong movement in favour of preserving the redwood forests and the groves of Big Trees (*Sequoia gigantea*). A Bill to purchase and protect one of the largest and noblest redwood forests, that of the Big Basin, has become a State law. The average annual lumber cut is as follows: redwood, 272,283,000 feet B.M.; yellow pine, 211,115,000 do.; sugar pine, 50,736,000 do.; spruce, 21,963,000 do.; fir, 20,508,000 do.; cedar, 4,882,000 do.; with a total value of \$14,537,000.

Transportation.—The mileage of railroads was (1900) 5532 miles; ten times as great as in 1876. This is practically all in the hands of the Southern Pacific railway (controlled by the Union Pacific) and the Atchison, Topeka, and Santa Fé railway, each having a transcontinental system of over 7000 miles. The long, narrow State is traversed longitudinally by their trunk lines (three running from Los Angeles to San Francisco, about 500 miles), with numerous feeders, particularly in the southern counties. There are also many lines of steamships. The principal port is San Francisco, with its magnificent harbour. San Diego, San Pedro, Port Los Angeles, and Eureka have fair harbours and considerable commerce. The commerce of San Francisco amounts to between eighty and ninety million dollars annually, about equally divided between exports and imports.

Manufactures.—Manufactures have greatly increased since the census of 1890. In this year there were 7923 establishments, with \$146,797,102 capital; 83,642 employees, whose aggregate annual wages were \$51,538,780; total value of products, \$213,403,996.

Perhaps the most important single development has been the rise of great shipyards. The *Oregon* and several other first-class vessels for the U.S. navy were built in San Francisco. California was in 1900 the leading State in the production of beet sugar; it had \$10,139,780 invested in this manufacture as against \$20,958,519 for the whole U.S., and yielded a little over one-half the total U.S. product.

Finances.—In 1900 the assessed valuation of real estate was \$669,905,988; of improvements, \$272,447,321; of personal property, \$184,880,015. The total assessed valuation had more than doubled in twenty years. In 1880 it was \$584,578,036, and in 1900 it was \$1,218,292,457. In 1901 it was \$1,241,705,803. The returns from agriculture by the census of 1890 were \$72 per caput. The State has a nominal bonded debt of about two and a half millions, but owns the bonds. The total of county indebtedness was in 1901 \$3,333,233. The total receipts in 1900 were \$11,148,204; total disbursements, \$9,518,608.

Banking.—The banks on 31st August 1898 were as follows:—

Banks.	No.	Capital paid up.	Resources.
National . . .	34	\$10,825,000	\$50,660,651
Commercial . . .	172	31,139,300	125,354,783
Savings . . .	55	7,941,930	52,123,716
Private . . .	23	964,026	2,753,385
Total . . .	284	\$50,870,256	\$230,892,535

California has the largest savings bank deposits per caput. On 31st December 1898 there were in California \$637.75 per depositor, as against \$392.13 for the U.S., and \$507.29 for Rhode Island, the next highest State. The California depositors numbered 209,908, or nearly one in every seven of the entire population, Chinese and Indians included. The State was exceeded in 1890 only by Massachusetts and Rhode Island in assessed valuation per caput.

Political.—State politics have improved with the new immigration. A symptom probably of political health is the peculiar independence of Californian voters. In State elections since the Civil War, California went Democratic in 1867, 1875, 1882, 1886 (Democratic Governor and Republican Lieut.-Governor, who became Governor by his superior's death), and 1894. It went Republican in 1871, 1879, 1890, and 1898. The leading features of legislation since 1876 have been the struggle for exclusion of the Chinese, "Anti-Débris," and irrigation laws, and an elaborate system for the inspection and fumigation of fruit-trees, and the importation of predatory insects to destroy "insect pests." The Anti-Chinese agitation, though finally national in its scope, was initiated and chiefly carried on in California, as a majority of the Chinese in the United States were in this one State. In 1879 California voted against further immigration of Mongolians by 154,638 to 883. Exclusion has not been an unmixed blessing; but the conviction prevailed that a very large element of population, non-citizen and non-assimilable, sending most of its earnings out of the country, living meanly at best, and practically without wives, children, or homes, was socially and economically a menace that far outweighed the undoubted convenience of cheaper (and frequently more trustworthy) menial labour than the native population afforded. The exclusion was a serious factor in making the huge single-crop ranches unprofitable, and in leading to their replacement by small farms tilled and dwelt upon by American families. There are now about 45,000 Chinese in the State, many of them wealthy, and race-feeling against them has practically disappeared. For many years the mining interests were supreme, and agriculture, long after it assumed large proportions, was invariably worsted when the two clashed. The great conflicts were over water rights and hydraulic mining. In 1880 engineers' measurements showed that in the Yuba river alone over 100,000,000 cubic yards of gravel had been washed by the hydraulics into the bed of the stream, raising it in places over 70 feet above its normal level, and burying over 15,000 acres of choicest farming lands under the detritus. In 1884 the long and bitter "Anti-Débris" or "Anti-Slickens" fight ended in favour of the farmers. Local Option laws are in force, and a considerable proportion of the towns and smaller cities, particularly in the southern part of the State, adopt "prohibition." In most of the rest "high license" is rather strictly enforced. The Australian ballot was introduced in 1891. (C. F. L.)

California, Lower, a territory of the Mexican Republic, bounded on the N. by the United States, on the E. by the Gulf of California, and on the W. and S. by the Pacific. Its area covers 58,345 square miles. The population in 1879 was 30,208, and in 1895 it numbered 42,243. The coast-line measures 1860 miles, and is bordered by numerous islands. Though the country

is sterile, some portions of the peninsula have natural products of value, principally orchil or Spanish moss, used for dyeing purposes. Henequen is also found in the interior and hemp in the north. Sugar-cane and tropical fruits are successfully cultivated in the humid interior, as are also, to a limited extent, cereals, cotton, tobacco, &c. The principal mineral products are gold, silver, copper, lead, gypsum, and coal. There are no manufactures of any importance. The territory is divided into two districts, the Northern (pop. 7452) and the Southern (pop. 34,791). The capital of the former is La Paz (4737 inhabitants), and of the latter Ensenada de Todos Santos (1259 inhabitants). The principal towns are Santa Rosalia, Santiago, San Antonio, and San José.

Callander, a police burgh of Perthshire, Scotland, situated on the river Teith, and on the Caledonian railway, 15½ miles N.W. of Stirling. There are Established, United Free, and Episcopalian churches. The town owes its prosperity to its proximity to the Trossachs, and its general importance as a tourist centre, the surrounding country being renowned for the beauty of its lake, river, mountain, and woodland scenery. Within 2 miles to the N.E. are the Falls of Bracklinn. It possesses several large hotels and a hydropathic, and within recent years many villa residences have been erected. The population of the police burgh in 1891 was 1538, and in 1901 it was 1458. By way of the Pass of Leny, which begins or ends here, Callander practically forms the "gate of the Highlands." From here, too, the ascent of Ben Ledi is commonly made.

Callao, a coast department of central Peru, a littoral province, embracing only the city of Callao, with a population (1898) of 48,118. The port of Callao is the most important in Peru. In 1895 there entered 1376 merchant vessels, with a total tonnage of 563,160 tons; in 1896, 1485 vessels of 604,257 tons; and in 1898, 1255 of 591,685 tons, of which 201 were British, with a tonnage of 293,342 tons. In 1895 the receipts of the Callao Custom House were £211,763.

Calmar, a seaport town of Sweden, on the E. coast, 184 miles by rail N.E. from Malmö, *viâ* Alfveta on the Malmö-Stockholm railway. The industries embrace steam flour-mills, tobacco and match factories, and shipbuilding yards. There is an export trade in timber (£157,160 in 1898), oats, and matches; and import trade in cereals and flour (£100,000 to £200,000 a year), coffee, coal, manure, hides, petroleum, fish, tobacco, and sugar; the total exports amounting to £184,750 in 1898, and the total imports to £293,600. The harbour, which in 1899-1900 was deepened to admit vessels drawing 19 feet, is cleared by some 900 vessels of 180,000 tons annually. Population (1880), 10,963; (1898), 12,582.

Calne, municipal borough and railway station, in the Chippenham parliamentary division (since 1885) of Wiltshire, England, 18 miles E. by N. of Bath. A hospital for infectious diseases has been erected and a public recreation ground opened. Area of borough (extended in 1889), 356 acres; population on this in 1901, 3456. In 1889 the borough was constituted as the separate civil parish of Calne Within, the remainder of the ancient parish being called Calne Without.

Calorimetry signifies the measurement of quantities of heat, and must be distinguished from thermometry, which signifies the measurement of temperature. A calorimeter is any piece of apparatus in which heat is measured. This distinction of meanings is purely a matter of convention, but is very rigidly observed. Quantities of heat may be measured indirectly in a variety of ways in terms of

the different effects of heat on material substances. The most important of these effects are, (a) rise of temperature, (b) change of state, (c) transformation of energy.

§ 1. The rise of temperature of a body, when heat is imparted to it, is found to be in general nearly proportional to the quantity of heat added. The *thermal capacity* of a body is measured by the quantity of heat required to raise its temperature one degree, and is necessarily proportional to the mass of the body for bodies of the same substance under similar conditions. The *specific heat* of a substance is sometimes defined as the thermal capacity of unit mass, but more often as the ratio of the thermal capacity of unit mass of the substance to that of unit mass of water at some standard temperature. The two definitions are identical, provided that the thermal capacity of unit mass of water, at a standard temperature, is taken as the unit of heat. But the specific heat of water is often stated in terms of other units. In any case, it is necessary to specify the temperature, and sometimes also the pressure, since the specific heat of a substance generally depends to some extent on the external conditions. The methods of measurement, founded on rise of temperature, may be classed as *thermometric methods*, since they depend on the observation of change of temperature with a thermometer. The most familiar of these are the method of mixture and the method of cooling.

§ 2. The *Method of Mixture* consists in imparting the quantity of heat to be measured to a known mass of water, or some other standard substance, contained in a vessel or calorimeter of known thermal capacity, and in observing the rise of temperature produced, from which data the quantity of heat may be found as explained in all elementary text-books. This method is the most generally convenient and most readily applicable of calorimetric methods, but it is not always the most accurate, for various reasons. Some heat is generally lost in transferring the heated body to the calorimeter; this loss may be minimized by performing the transference rapidly, but it cannot be accurately calculated or eliminated. Some heat is lost when the calorimeter is raised above the temperature of its enclosure, and before the final temperature is reached. This can be roughly estimated by observing the rate of change of temperature before and after the experiment, and assuming that the loss of heat is directly proportional to the duration of the experiment and to the average excess of temperature. It can be minimized by making the mixing as rapid as possible, and by using a large calorimeter, so that the excess of temperature is always small. The latter method was generally adopted by Joule, but the rise of temperature is then difficult to measure with accuracy, since it is necessarily reduced in nearly the same proportion as the correction. There is, however, the advantage that the correction is rendered much less uncertain by this procedure, since the assumption that the loss of heat is proportional to the temperature-excess is only true for small differences of temperature. Rumford proposed to eliminate this correction by starting with the initial temperature of the calorimeter as much below that of its enclosure as the final temperature was expected to be above the same limit. This method has been very generally recommended, but it is really bad, because, although it diminishes the absolute magnitude of the correction, it greatly increases the uncertainty of it, and therefore the probable error of the result. The coefficient of heating of a calorimeter when it is below the temperature of its surroundings is seldom, if ever, the same as the coefficient of cooling at the higher temperature, since the convection currents, which do most of the heating or cooling, are rarely symmetrical in the two cases, and moreover, the duration of the two stages is seldom the same. In any case, it is desirable to diminish the loss of heat as much as possible by polishing the exterior of the calorimeter to diminish radiation, and by suspending it by non-conducting supports, inside a polished case, to protect it from draughts. It is also very important to keep the surrounding conditions as constant as possible throughout the experiment. This may be secured by using a large water-bath to surround the apparatus, but in experiments of long duration it is necessary to use an accurate temperature regulator. The method of lagging the calorimeter with cotton-wool, or other non-conductors, which is often recommended, diminishes the loss of heat considerably, but renders it very uncertain and variable, and should never be used in work of precision. The bad conductors take so long to reach a steady state that the rate of loss of heat at any moment depends on the past history more than on the tempera-

ture of the calorimeter at the moment. A more serious objection to the use of lagging of this kind is the danger of its absorbing moisture. The least trace of damp in the lagging, or of moisture condensed on the surface of the calorimeter, may produce serious loss of heat by evaporation. This is another objection to Rumford's method of cooling the calorimeter below the surrounding temperature before starting. Among minor difficulties of the method may be mentioned the uncertainty of the thermal capacity of the calorimeter and stirrer, and of the immersed portion of the thermometer. This is generally calculated by assuming values for the specific heats of the materials obtained by experiment between 100° C. and 20° C. Since the specific heats of most metals increase rapidly with rise of temperature, the values so obtained are generally too high. It is best to make this correction as small as possible by using a large calorimeter, so that the mass of water is large in proportion to that of metal. Analogous difficulties arise in the application of other calorimetric methods. The accuracy of the work in each case depends principally on the skill and ingenuity of the experimentalist in devising methods of eliminating the various sources of error.

§ 3. *Method of Cooling*.—A common example of this method is the determination of the specific heat of a liquid by filling a small calorimeter with the liquid, raising it to a convenient temperature, and then setting it to cool in an enclosure at a steady temperature, and observing the time taken to fall through a given range when the conditions have become fairly steady. The same calorimeter is afterwards filled with a known liquid, such as water, and the time of cooling is observed through the same range of temperature, in the same enclosure, under the same conditions. The ratio of the times of cooling is equal to the ratio of the thermal capacities of the calorimeter and its contents in the two cases. The advantage of the method is that there is no transference or mixture; the defect is that the whole measurement depends on the assumption that the rate of loss of heat is the same in the two cases, and that any variation in the conditions, or uncertainty in the rate of loss, produces its full effect in the result, whereas in the previous case it would only affect a small correction. Other sources of uncertainty are, that the rate of loss of heat generally depends to some extent on the rate of fall of temperature, and that it is difficult to take accurate observations on a rapidly falling thermometer. As the method is usually practised, the calorimeter is made very small, and the surface is highly polished to diminish radiation. It is better to use a fairly large calorimeter to diminish the rate of cooling and the uncertainty of the correction for the water equivalent. The surface of the calorimeter and the enclosure should be permanently blackened so as to increase the loss of heat by radiation as much as possible as compared with the losses by convection and conduction, which are less regular. For accurate work it is essential that the liquid in the calorimeter should be continuously stirred, and also in the enclosure, the lid of which must be water-jacketed, and kept at the same steady temperature as the sides. When all these precautions are taken, the method loses most of the simplicity which is its chief advantage. It cannot be satisfactorily applied to the case of solids or powders, and is much less generally useful than the method of mixture.

§ 4. *Method of Fusion*.—The methods depending on change of state are theoretically the simplest, since they do not necessarily involve any reference to thermometry, and the corrections for external loss of heat and for the thermal capacity of the containing vessel can be completely eliminated. They nevertheless present peculiar difficulties and limitations, which render their practical application more troublesome and more uncertain than is usually supposed. They depend on the experimental fact that the quantity of heat required to produce a given change of state (e.g., to convert one gramme of ice at 0° C. into water at 0° C., or one gramme of water at 100° C. into steam at 100° C.) is always the same, and that there need be no change of temperature during the process. The difficulties arise in connexion with the determination of the quantities of ice melted or steam condensed, and in measuring the latent heat of fusion or vaporization in terms of other units for the comparison of observations. The earlier forms of ice-calorimeter, those of Black, and of Laplace and Lavoisier, were useless for work of precision, on account of the impossibility of accurately estimating the quantity of water left adhering to the ice in each case. This difficulty was overcome by the invention of the Bunsen calorimeter, in which the quantity of ice melted is measured by observing the diminution of volume, but the successful employment of this instrument requires considerable skill in manipulation. The sheath of ice surrounding the bulb must be sufficiently continuous to prevent escape of heat, but it must not be so solid as to produce risk of strain. The ideal condition is difficult to secure. In the practical use of the instrument it is not necessary to know both the latent heat of fusion of ice and the change of volume which occurs on melting; it is sufficient to determine the change of volume per calorie, or the quantity of mercury which is drawn into the bulb of the

apparatus per unit of heat added. This can be determined by a direct calibration, by inserting a known quantity of water at a known temperature, and observing the contraction, or weighing the mercury drawn into the apparatus. In order to be independent of the accuracy of the thermometer employed for observing the initial temperature of the water introduced, it has been usual to employ water at 100°C., adopting as unit of heat the "mean calorie," which is one-hundredth part of the heat given up by one gramme of water in cooling from 100° to 0°C. The weight of mercury corresponding to the mean calorie has been determined with considerable care by a number of observers well skilled in the use of the instrument. The following are some of their results:—Bunsen, 15.41 mgm.; Velten, 15.47 mgm.; Zakrevski, 15.57 mgm.; Staub, 15.26 mgm. The explanation of these discrepancies in the fundamental constant is not at all clear, but they may be taken as an illustration of the difficulties of manipulation attending the use of this instrument, to which reference has already been made. It is not possible to deduce a more satisfactory value from the latent heat and the change of density, because these constants are very difficult to determine. The following are some of the values deduced by well-known experimentalists for the latent heat of fusion:—Regnault, 79.06 to 79.24 calories, corrected by Person to 79.43; Person, 79.99 calories; Hess, 80.34 calories; Bunsen, 80.025 calories. Regnault, Person, and Hess employed the method of mixture, which is probably the most accurate for the purpose. Person and Hess avoided the error of water sticking to the ice by using dry ice at various temperatures below 0°C., and determining the specific heat of ice as well as the latent heat of fusion. These discrepancies might, no doubt, be partly explained by differences in the units employed, which are somewhat uncertain, as the specific heat of water changes rapidly in the neighbourhood of 0°C.; but making all due allowance for this, it remains evident that the method of ice-calorimetry, in spite of its theoretical simplicity, presents grave difficulties in its practical application.

§ 5. *The Method of Condensation* was first successfully applied by Joly in the construction of his steam calorimeter, a full description of which will be found in several recent text-books. The body to be tested is placed in a special scale-pan, suspended by a fine wire from the arm of a balance inside an enclosure which can be filled with steam at atmospheric pressure. The temperature of the enclosure is carefully observed before admitting steam. The weight of steam condensed on the body gives a means of calculating the quantity of heat required to raise it from the atmospheric temperature up to 100°C. in terms of the latent heat of vaporization of steam at 100°C. There can be no appreciable gain or loss of heat by radiation, if the admission of the steam is sufficiently rapid, since the walls of the enclosure are maintained at 100°C., very nearly. The thermal capacity of the scale-pan, &c., can be determined by a separate experiment, or, still better, eliminated by the differential method of counterpoising with an exactly similar arrangement on the other arm of the balance. The method requires very delicate weighing, as one calorie corresponds to less than two milligrammes of steam condensed; but the successful application of the method to the very difficult problem of measuring the specific heat of a gas at constant volume, shows that these and other difficulties have been very skilfully overcome. The application of the method appears to be practically limited to the measurements of specific heat between the atmospheric temperature and 100°C. The results depend on the value assumed for the latent heat of steam, which Joly takes as 536.7 calories, following Regnault. Joly has himself determined the mean specific heat of water between 12° and 100°C. by this method, in terms of the latent heat of steam as above given, and finds the result .9952. Assuming that the mean specific heat of water between 12° and 100° is really 1.0011 in terms of the calorie at 20°C. (see table below), the value of the latent heat of steam at 100°C., as determined by Joly, would be 540.2 in terms of the same unit. The calorie employed by Regnault is to some extent uncertain, but the difference is hardly beyond the probable errors of experiment, since it appears from the results of recent experiments that Regnault made an error of the same order in his determination of the specific heat of water at 100°C.

§ 6. *Energy Methods.*—The third general method of calorimetry, that based on the transformation of some other kind of energy into the form of heat, rests on the general principle of the conservation of energy, and on the experimental fact that all other forms of energy are readily and completely convertible into the form of heat. It is therefore often possible to measure quantities of heat indirectly, by measuring the energy in some other form and then converting it into heat. In addition to its great theoretical interest, this method possesses the advantage

of being frequently the most accurate in practical application, since energy can be more accurately measured in other forms than in that of heat. The two most important varieties of the method are (a) mechanical, and (b) electrical. These methods have reached their highest development in connexion with the determination of the mechanical equivalent of heat, but they may be applied with great advantage in connexion with other problems, such as the measurement of the variation of specific heat, or of latent heats of fusion or vaporization.

§ 7. *Mechanical Equivalent of Heat.*—The phrase "mechanical equivalent of heat" is somewhat vague, but has been sanctioned by long usage. It is generally employed to denote the number of units of mechanical work or energy which, when completely converted into heat without loss, would be required to produce one heat unit. The numerical value of the mechanical equivalent necessarily depends on the particular units of heat and work employed in the comparison. The British engineer prefers to state results in terms of foot-pounds of work in any convenient latitude per pound-degree-Fahrenheit of heat. The Continental engineer prefers kilogrammetres per kilogramme-degree-centigrade. For scientific use the C.G.S. system of expression in ergs per gramme-degree-Centigrade, or "calorie," is the most appropriate, as being independent of the value of gravity. A more convenient unit of work or energy, in practice, on account of the smallness of the erg, is the *joule*, which is equal to 10^7 ergs, or one *watt-second* of electrical energy. On account of its practical convenience, and its close relation to the international electrical units, the *joule* has been recommended by the British Association for adoption as the absolute unit of heat. Other convenient practical units of the same kind would be the *watt-hour*, 3600 joules, which is of the same order of magnitude as the kilo-calorie, and the *kilowatt-hour*, which is the ordinary commercial unit of electrical energy.

§ 8. *Joule.*—The earlier work of Joule is now chiefly of historical interest, but his later measurements in 1878, which were undertaken on a larger scale, adopting Hirn's method of measuring the work expended in terms of the torque and the number of revolutions, still possess value as experimental evidence. In these experiments the paddles were revolved by hand at such a speed as to produce a constant torque on the calorimeter, which was supported so as to be free to turn, but was kept at rest by the couple due to a pair of equal weights suspended from fine strings passing round the circumference of a horizontal wheel attached to the calorimeter. Each experiment lasted about forty minutes, and the rise of temperature produced was nearly 3°C. The calorimeter contained about 5 kilogrammes of water, so that the rate of heat-supply was about 6 calories per second. Joule's final result was 772.55 foot-pounds at Manchester per pound-degree-Fahrenheit at a temperature of 62°F., but individual experiments differed by as much as 1 per cent. This result in C.G.S. measure is equivalent to 4.177 joules per calorie at 16.5°C., on the scale of Joule's mercury thermometer. His thermometers were subsequently corrected to the Paris scale by Schuster in 1895, which had the effect of reducing the above figure to 4.173.

§ 9. *Rowland.*—About the same time Rowland (*Proc. Amer. Acad.* xv. p. 75, 1880) repeated the experiment, employing the same method, but using a larger calorimeter (about 8400 grammes) and a petroleum motor, so as to obtain a greater rate of heating (about 84 calories per second), and to reduce the importance of the uncertain correction for external loss of heat. He also paid greater attention to the important question of thermometry, and extended his researches over a much wider range of temperature, namely 5° to 35°C. His experiments revealed for the first time a diminution in the specific heat of water with rise of temperature between 0° and 30°C., amounting to four parts in 10,000 per 1°C. His thermometers have been recently compared with a mercury thermometer standardized in Paris, and with a platinum thermometer standardized by Griffiths. The result has been to reduce the coefficient of diminution of specific heat at 15°C. by nearly one half, but the absolute value at 20°C. is practically unchanged. Thus corrected his values are as follows:—

Temperature	10°	15°	20°	25°	30°	35°
Joules per cal.	4.197	4.188	4.181	4.176	4.175	4.177

These are expressed in terms of the hydrogen scale but the

difference from the nitrogen scale is so small as to be within the limits of experimental error in this particular case. Rowland himself considered his results to be probably correct to one part in 500, and that the greatest uncertainty lay in the comparison of the scale of his mercury thermometer with the air thermometer. The subsequent correction, though not carried out strictly under the conditions of the experiment, has shown that the order of accuracy of his work about the middle of the range from 15° to 25° was at least 1 in 1000, and probably 1 in 2000. At 30° he considered that, owing to the increasing magnitude and uncertainty of the radiation correction, there "might be a small error in the direction of making the equivalent too great, and

five revolutions per minute on the speed. These variations, so far as they were of a purely accidental nature, would be approximately eliminated on the mean of a large number of trials, so that the accuracy of the final result would be of a higher order than might be inferred from a comparison of separate pairs of trials. Great pains were taken to discuss and eliminate all the sources of constant error which could be foreseen. The results of the light trials with 400 foot-pounds on the brake differ slightly from those with 600 foot-pounds. This might be merely accidental, or it might indicate some constant difference in the conditions requiring further investigation. It would have been desirable, if possible, to have tried the effect of a larger range of variation in the experimental conditions of load and speed, with a view to detect the existence of constant errors; but owing to the limitations imposed by the use of a steam-engine, and the difficulty of securing steady conditions of running, this proved to be impossible. There can be no doubt, however, that the final result is the most accurate direct determination of the value of the mean calorie between 0° and 100° C. in mechanical units. Expressed in joules per calorie the result is 4.1832, which agrees very closely with the value found by Rowland as the mean over the range 15° to 20° C. The value 4.183 is independently confirmed in a remarkable manner by the results of the electrical method described below, which give 4.185 joules for the mean calorie, if Rowland's value is assumed as the starting-point, and taken to be 4.180 joules at 20° C.

Fig. 1.

that the specific heat might go on decreasing to even 40° C." The results considered with reference to the variation of the specific heat of water are shown in the curve marked Rowland in Fig. 1.

§ 10. *Reynolds and Moorby* (*Phil. Trans.* 1897, p. 381) have determined the mechanical equivalent of the mean thermal unit between 0° and 100° C., on a very large scale, with a Froude-Reynolds hydraulic brake and a steam-engine of 100 h.p. This brake is practically a Joule calorimeter, ingeniously designed to churn the water in such a manner as to develop the greatest possible resistance. The admission of water at 0° C. to the brake was controlled by hand in such a manner as to keep the outflow nearly at the boiling-point, the quantity of water in the brake required to produce a constant torque being regulated automatically, as the speed varied, by a valve worked by the lifting of the weighted lever attached to the brake. With 300 pounds on a four-foot lever at 300 revolutions per minute, the rate of generation of heat was about 12 kilo-calories per second. In spite of the large range of temperature, the correction for external loss of heat amounted to only 5 per cent with the brake uncovered, and was reduced to less than 2 per cent by lagging. This is the special advantage of working on so large a scale with so rapid a generation of heat. But, for the same reason, the method necessarily presents peculiar difficulties, which were not overcome without great pains and ingenuity. The principal troubles arose from damp in the lagging, which necessitated the rejection of several trials, and from dissolved air in the water, causing loss of heat by the formation of steam. Next to the radiation loss, the most uncertain correction was that for conduction of heat along the 4-inch shaft. These losses were as far as possible eliminated by combining the trials in pairs, with different loads on the brake, assuming that the heat-loss would be the same in the heavy and light trials, provided that the external temperature and the gradient in the shaft, as estimated from the temperature of the bearings, were the same. The values deduced in this manner for the equivalent agreed as closely as could be expected considering the impossibility of regulating the external condition of temperature and moisture with any certainty in an engine-room. The extreme variation of results in any one series was only from 776.63 to 779.46 foot-pounds, or less than $\frac{1}{2}$ per cent. This variation may have been due to the state of the lagging, which Moorby distrusted in spite of the great reduction of the heat-loss, or it may have been partly due to the difficulty of regulating the speed of the engine and the water-supply to the brake in such a manner as to maintain a constant temperature in the outflow, and avoid variations in the heat capacity of the brake. Since hand regulation is necessarily discontinuous, the speed and the temperature were constantly varying, so that it was useless to take readings nearer than the tenth of a degree. The largest variation recorded in the two trials of which full details are given, was 4.9° F. in two minutes in the outflow temperature, and four or

five revolutions per minute on the speed. These variations, so far as they were of a purely accidental nature, would be approximately eliminated on the mean of a large number of trials, so that the accuracy of the final result would be of a higher order than might be inferred from a comparison of separate pairs of trials. Great pains were taken to discuss and eliminate all the sources of constant error which could be foreseen. The results of the light trials with 400 foot-pounds on the brake differ slightly from those with 600 foot-pounds. This might be merely accidental, or it might indicate some constant difference in the conditions requiring further investigation. It would have been desirable, if possible, to have tried the effect of a larger range of variation in the experimental conditions of load and speed, with a view to detect the existence of constant errors; but owing to the limitations imposed by the use of a steam-engine, and the difficulty of securing steady conditions of running, this proved to be impossible. There can be no doubt, however, that the final result is the most accurate direct determination of the value of the mean calorie between 0° and 100° C. in mechanical units. Expressed in joules per calorie the result is 4.1832, which agrees very closely with the value found by Rowland as the mean over the range 15° to 20° C. The value 4.183 is independently confirmed in a remarkable manner by the results of the electrical method described below, which give 4.185 joules for the mean calorie, if Rowland's value is assumed as the starting-point, and taken to be 4.180 joules at 20° C.

§ 11. *Electrical Methods*.—The value of the international electrical units has by this time been so accurately determined in absolute measure that they afford a very good, though indirect, method of determining the mechanical equivalent of heat. But, quite apart from this, electrical methods possess the greatest value for calorimetry, on account of the facility and accuracy of regulating and measuring the quantity of heat supplied by an electric current. The frictional generation of heat in a metallic wire conveying a current can be measured in various ways, which correspond to slightly different methods. By Ohm's law, and by the definition of difference of electric pressure or potential, we obtain the following alternative expressions for the quantity of heat H in joules generated in a time T seconds by a current of C amperes flowing in a wire of resistance R ohms, the difference of potential between the ends of the wire being $E = CR$ volts:—

$$H = ECT = C^2RT = E^2T/R. \quad (1).$$

The method corresponding to the expression C^2RT was adopted by Joule and by most of the early experimentalists. The defects of the earlier work from an electrical point of view lay chiefly in the difficulty of measuring the current with sufficient accuracy owing to the imperfect development of the science of electrical measurement. These difficulties have been removed by the great advances since 1880, and in particular by the introduction of accurate standard cells for measurements of electrical pressure.

§ 12. *Griffiths*.—The method adopted by Griffiths (*Phil. Trans.* 1893, p. 361), whose work threw a great deal of light on the failure of previous observers to secure consistent results, corresponded to the last expression E^2T/R , and consisted in regulating the current by a special rheostat, so as to keep the potential difference E on the terminals of the resistance R balanced against a given number of standard Clark cells of the Board of Trade pattern. The resistance R could be deduced from a knowledge of the temperature of the calorimeter and the coefficient of the wire. But in order to obtain trustworthy results by this method he found it necessary to employ very rapid stirring (2000 revolutions per minute), and to insulate the wire very carefully from the liquid to prevent leakage of the current. He also made a special experiment to find how much the temperature of the wire exceeded that of the liquid under the conditions of the experiment. This correction had been neglected by previous observers employing similar methods. The resistance R was about 9 ohms, and the potential difference E was varied from three to six Clark cells,
